PREFACE.

As we have hitherto, on the completion of each of our former Volumes, seized hold of the opportunity to address a few words to our readers, regarding ourselves, our objects, and our hopes of success in working them out, we are unwilling now to discontinue a ceremony which we have felt to be an agreeable one, although, in truth, we have not on the present occasion much to say.

Our objects have been so often explained that we feel it to be quite unnecessary that we should say another word on that subject. Of our success in working them out, if we may judge by the favour with which we continue to be received by the public, we have every reason to feel the most gratifying assurance.

We shall continue in the same course by which we have reached our present honourable position in the periodical press, diligently searching everywhere for such intellectual fare to lay before our readers, as will nourish into health and vigour, not their understandings only, but also their principles and affections,—and taking care to present it in a form, and with accompaniments, fitted to refine their tastes, and permanently to elevate their whole habits of thought.

We take this opportunity of stating, that we have entered into arrangements with some of the most eminent Artists of the day, for the supply of Illustrations for our succeeding Numbers, of a character which we venture to say will defy competition. Determined to sustain unimpaired the character this Magazine has already earned, of furnishing, for the gratification of the popular taste, Illustrations which, for design and execution, have never been equalled at the price, we have at a great sacrifice added materially to the expense of that department of the Magazine, and have secured the services of gentlemen whose names stand among the highest in the ranks of living Art. Prints of some of the best pictures intended for the exhibitions of the present season, will early appear in this Magazine, brought out under the superintendence of the artists.

No. 31, 286, Date 01.06.04.

Man, hound, and horse, of higher fame,
To wake the wild deer never came,
Since Alnwick's earl pursued the game
On Cheviot's rueful day :

Keeldar was matchless in his speed,
Than Tarras ne'er was stauncher steed,
A peerless archer Percy Redo;
And right dear friends were they.

The chase engross'd their joys and woes;
Together at the dawn they rose,
Together shared the noon's repose,
By fountain or by stream;
And oft, when evening skies were red,
The heather was their common bed,
Where each, as wildering fancy led,
Still hunted in his dream.

Now is the thrilling moment near
Of sylvan hope and sylvan fear;
Yon thicket holds the harbour'd deer,
The signs the hunters know.
With eyes of flame and quivering ears,
The brake sagacious Keeldar nears;
The restless palfrey paws and rears;
The archer strings his bow.

The game's afoot! Halloo! halloo!
Hunter, and horse, and hound pursue;
But woe the shaft that erring flew—
That e'er it left the string!
And ill betide the faithless yew!
The stag bounds scathless o'er the dew,
And gallant Keeldar's life-blood true
Has drench'd the grey-geese wing.

The noble hound—he dies, he dies,—
Death, death has glazed his fixed eyes,
Stiff on the bloody heath he lies,
Without a groan or quiver;
Now day may break and bugle sound,
And whoop and halloo ring around,
And o'er his couch the stag may bound,
But Keeldar sleeps for ever.

Dilated nostrils, staring eyes,
Mark the poor palfrey's mute surprise,
He knows not that his comrade dies,
Nor what is death; but still
His aspect hath expression drear
Of grief and wonder, mix'd with fear,
Like startled children when they hear
Some mystic tale of ill.

But he that bent the fatal bow
Can well the sum of evil know,
And o'er his favourite bending low,
In speechless grief recline,—
Can think he hears the senseless clay
In unreproachful accents say,
"The hand that took my life away,
Dear master, was it thine?"

And if it be, the shaft be bless'd,
Which sure some erring aim address'd,
Since in your service prized, caress'd,
I in your service die;
And you may have a fleetier hound
To match the dun-deer's merry bound,
But by your couch will ne'er be found
So true a guard as I."

And to his last stout Percy rued
The fatal chance; for when he stood
'Gainst fearful odds in deadly feud,
And fell amid the fray,
E'en with his dying voice he cried,
"Had Keeldar but been at my side,
Your treacherous ambush had been spied—
I had not died to-day!"

Walter Scott.¹

(1) "The Death of Keeldar" appeared in "The Gem" of 1829. The editor, T. Hood, acknowledges it in these words in his preface:—"To Sir W. Scott, not merely a literary feather in my cap, but a whole plume of them, I owe, and with the hand of my heart acknowledge, a deep obligation. A poem from his pen is likely to confer on the book that contains it, if not perpetuity, at least a very Old Mortality."

THE PRIVILEGES OF VIENNA.

The Austrian is an absolute monarchy, but not in our sense of the word, the exercise of the imperial power being checked and circumscribed, in almost every province, by a number of privileges enjoyed by the subjects, for the most part of great antiquity, which the good sense or good feeling of the government has hitherto uniformly respected. As King of Hungary, and Prince of Transylvania, the Emperor has to share the legislative and executive power with the Diets of both these countries. Every other province but Dalmatia has its particular assemblies, though the rights of those provincial assemblies greatly differ, and extend but a very little way. The principal cities, again, have their municipal privileges, some of them of great importance, and among these Vienna, the capital, has been especially favoured.

With the single exception of the Emperor Rudolph, who generally lived at Prague, Vienna has at all times been the residence of the heads of the house of Habsburg, and the unshaken fidelity of its inhabitants has been rewarded by the steady favour of their sovereigns. Most of their municipal privileges date from signal acts of loyalty and devotion; and the most important were bestowed by Leopold I. in acknowledgment of the desperate heroism with which, in 1683, under the command of Stahremberg, they held out the city against the Turks, unassisted by regular troops, till relieved by the approach of Sobieski. The possession of these privileges, which are too numerous to be specified, combined with the opulence derived from the lavish expenditure of the great aristocratic families, have given the Viennese a degree of personal independence, and a disposition to act energetically when called upon, which is not equally characteristic of the lowland inhabitants of the hereditary states.

The burgomaster, (*burg-meister*), who is the head and representative of these wealthy citizens, in many respects resembles the Lord Mayor of London, and is in his own sphere even a more important person. His election, indeed, must be confirmed by the Emperor, which puts him much more than the English dignitary under the control of the government; but, on the other hand, when he is elected, his power is much greater. His office is for life, and he cannot be removed from it. He has the personal liberty of every citizen subject to him; the absolute command of the police; the colonelship of the city militia, which, by the bye, is the finest and best drilled force of the kind in Europe; and many potent offices besides. Prince Metternich himself is less than him in (at least nominal) dignity, so long as he remains at Vienna, and the Emperor alone can give him orders.

The city privileges in their turn are curtailed and interrupted by others of an equally historical origin, attaching mostly to different military bodies. One of these, from the singularity of its observance, and of the incident with which it is connected, is deserving of more attention than it has met with hitherto.

The Emperor Ferdinand II. had hardly seated himself on the throne of his predecessor, Matthias, when the religious storm which had been gathering over Germany, and which ended in the famous Thirty Years' War, burst on him at once. Bohemia, under the Count Thurn, the dissidents of Silesia and Moravia, those of Upper and Lower Austria,—nearly all his German subjects in short,—either took up arms, or openly wavered in their fidelity. Bethlen Gabor and the Turks threatened him on the side of Hungary, and the Protestants of Carinthia and Carniola joined the insurgents. Alone amid enemies,—for the inhabitants of Vienna, at that time, were either Protestants or favourers of the reformed faith,—the Emperor was at last fairly block-

aded in his palace, but remained unsubdued. He dispatched his children to the Tyrol for safety, and remained himself with the famous Father Lamormain, his Confessor, waiting, to all appearance, till his insurgent subjects should formally come to take his crown.

The Protestant barons, emboldened by the rapid progress of their party in Bohemia, determined, by a bold stroke, to bring the crisis to a conclusion. The town-guard consisted entirely of citizens, and made no difficulty about surrendering to them the charge of the Emperor's person. All the regiments which might have stood in their way were removed to posts at a distance, and, one by one, the counsellors in whom he had any confidence were withdrawn. Their purpose was at once to compel Ferdinand by force to sign their demands, which he had hitherto steadily refused. These demands embraced a national representation, absolute liberty of conscience, and equality of privileges for Catholics and Protestants in all matters civil and political. Not that they expected that the Emperor, knowing what his character was, would consent, but his refusal would give them a tangible pretext for effecting his deposition.

Early one morning, when all was ready, the conspirators, sixteen in number, with Thourall, the leader of the citizens, at their head, entered the imperial palace, and made their way without difficulty to the Emperor's chamber. Ferdinand was alone, but nothing could shake his determination not to sign the paper. Thourall, at last, exasperated beyond patience, and fixed to stick at nothing in the execution of his purpose, seized the diminutive emperor by the collar of his dress, and shook him violently in his powerful hands.—“Little Ferdinand, wilt thou sign?” he said, in a voice half choked with fury,—“sign this moment, or, little as thou art, I will find means to shorten thee still.”

At this very moment, (the story here savours of the marvellous,) a blast of trumpets rose from the court below. All rushed to the windows, and there they beheld, drawn up in squadron, with their sabres bared, the cuirassiers of the Dauphin's regiment, five hundred strong. The sight was the more unlooked-for, as these very men had, on account of their known loyalty, been sent only a few days before to Linz, more than a hundred miles off.

Almost at the same instant, before they could conjecture even how the regiment could be there, when, only two days before, their agents had written them word that it was at Linz, three raps were heard at the door, announcing the arrival of some new actor in this extraordinary scene. The door opened, and the Marquis de St. Hilaire, the colonel of the cuirassiers, entered in complete armour. Bending reverently to the Emperor, he inquired his orders.

Ferdinand till now had been pale as ashes, but the colour now rushed to his cheeks. His eyes sparkled, and he commanded the sixteen conspirators to be seized on the spot. No sooner said than done,—twenty cuirassiers rushed up the staircase, and they, who five minutes before had been his masters, were now borne hurriedly away to execution. Thourall, by some means or other, was lucky enough to escape, but the others all were hung the self-same day outside the town. A beautiful suburb since then has sprung up on the spot, the name of which, (“Herrnhals,” Lords'-neck,) indirectly recalls the memory of this terrible act of retribution.

Of the authenticity of this story there is no doubt, but nothing is known to account for its principal incident. When Ferdinand asked the Marquis de St. Hilaire from whom he had received his orders to march on Vienna, the brave soldier, greatly surprised at such a question from such a quarter, drew from under his cuirass a paper, bearing the seal of state, and the Emperor's signature. It was a letter ordering the colonel without delay to get hold of all the boats on the Danube he could find, and embark in them with as many of his

men as could be got together on the spur of the moment, leaving word for the rest to follow in the shortest possible time. "You will descend the river to Vienna," the instructions continued, "you will pass through the town as silently as possible, and draw up at the palace. When there, you will seek the Emperor without having yourself announced, and further act as he shall direct."

Ferdinand, after reading the letter attentively through, was obliged to allow that the hand and seal were so perfectly imitated that they might well mislead, but denied having ever issued any orders of the kind, or even thought of so doing, as the watch kept over his slightest actions would have put it out of his power to communicate with his faithful subjects. His punctilious regard for truth was well known; and as his mysterious protector never came to light, the chroniclers are reduced to a variety of incongruous suppositions, some ascribing all to an actual interposition of Providence, and others to the Jesuit Lamormain.

That which is certain is, that this was the turning point of Ferdinand's eventful history. Henceforward everything went well with him. Boucquoi overthrew Count Mansfeldt, Prague surrendered, and the Bohemians were finally put down. Germany streamed with blood, but the imperial arms still conquered, and Tilly and Wallenstein entered upon that career which was destined to crown them with undying laurel.

Upon his miraculous deliverance, Ferdinand, having good reason to distrust the citizens, kept the Dampierre regiment near him. For three successive days and nights, the men remained under arms in the palace court, and revelled at the Emperor's cost, while the Marquis de St. Hilaire was lodged in the Emperor's own apartments. Ever since, the same regiment has preserved the privilege, whenever its route lies through Vienna, of marching through the city, with trumpets sounding and flags displayed, to the imperial palace, where it remains in quarters three days and three nights, and feasts *ad libitum* at the Emperor's cost. The colonel dismounts, ascends the staircase without being announced, knocks three times, and inquires the Emperor's orders. As there are no more rebels to hang, these are limited to an invitation to the palace for three days. A room of state is assigned him. The standard of the regiment hangs over his door, and a sentinel stands before it as before that of the sovereign.

BLACK FRITZ.

AN EPISODE OF THE THIRTY YEARS' WAR.¹

CHAP. I.

It was on a gloomy autumnal evening of the year 1648, that Count Martinitz, with his niece Luitgarde, after a long absence, drove up to the castle of his ancestors. Many years before, in spite of the horrors of the Thirty Years' War, he had not been able to resolve on abandoning the residence of his affections; courageously he braved the first storms of the devastating inroads, the consequences of the battle of Prague, and many other untoward events. He hoped, as negotiations were already begun, to have reached the haven of repose in his native home, when, quite unexpectedly, Banner's and Torstenson's ferocious bands penetrated with fire and sword, and the irresistible wave rolled in the direction of his neighbourhood. Nothing now remained, therefore, but to fly with his wife and child, and to yield up his castle to the destroying hordes.

¹ By the Author of "Quentin Matsys," and founded, like it, on historical facts.

At Prague, where he sought refuge, and not without difficulty found it, his beloved wife and youngest boy died from the effects of terror and fatigue. Overwhelmed with anguish, the count left Prague for Vienna, as the former city suggested only saddening recollections; in the latter, where many of his friends resided, his sorrows gradually died away in the circle of those dear relatives, and, when the ardently desired peace had assuaged the sufferings of the exhausted country, a calm but settled desire drew him to the forsaken place of his birth, to the tombs of his ancestors; and he proposed to celebrate there the marriage festival of his oldest and now only son.

Count Frederick was an amiable young man, and united, to a graceful presence and agreeable accomplishments, the possession of large domains. He was a general favourite in society, and had many friends; he designed and painted, was successful in taking likenesses, and had thus a large volume of portraits of his acquaintances, executed during his travels. He had seen Paris, Madrid, and parts of Italy, and, for the time in which he lived, and for his position in the world, he was regarded as a kind of wonder. His father looked forward to his prospects with joy and pride, and what increased the gratifying anticipations of the old nobleman was the general opinion of his son's good morals, which he had, happily, on all occasions known how to preserve, and bring back uncorrupted to his native country.

For a long time past, family arrangements and youthful inclinations had marked out Luitgarde and Count Frederick for each other. The old count did not simply love in his niece the faithful resemblance of a dear sister; he loved in her the innocent character, the calm good sense, which the stormy events of that period had developed earlier than years are accustomed to do. Her childhood and early youth were passed at Prague, and at Vienna, among her kindred;—Count Frederick's studios and travels had separated her for a long time from him, and she now looked forward with internal satisfaction to a meeting and a union with the playmate of her childhood, which, since the development of her intellect, she was accustomed to consider as the most agreeable epoch of her life. She clung with an infantine tenderness to her uncle, and willingly accepted his proposal to accompany him to Bohemia, and, in his society in his solitary castle, to await the arrival of Count Frederick.

In sanguine anticipations of happier times did they travel, during an abundant harvest, through the golden fields of rich Austria. On the Bohemian frontiers the scene changed; the thirty years' suffering from a religious and social war had left inextinguishable traces on the country—villages in which some poor huts began to rise amidst fallen half-consumed rafters,—pallid figures, from whose eyes spake want and misery,—large extents of uncultivated land,—towns without trade and without provisions,—complaints of the brutality of the peasantry, of the insecurity of the roads,—bore a cruel testimony, everywhere, to its destructive consequences. Luitgarde's cheerful heart gradually sank within her: silent and full of thought she sat near her uncle, in whose soul the surrounding imagery of wretchedness seemed to call up heart-rending recollections. The clear autumnal weather gave place to dark foggy days; the gloomy envelope that covered the minds of Luitgarde and her uncle seemed to have extended itself over all nature; a misty rain continually pattered through the brown-coloured foliage of the forest, and a chilling breeze chased the falling leaves into the waves of the Moldaw, which, with deep monotonous stream, flowed close to the road. At the nearest turning of the way the grey walls of a handsome castle presented themselves to view; the count first observed it,

and as he silently with his finger pointed it out, a deep sigh escaped him. Luitgarde fully understood what was passing in her uncle's mind, at the sight of the well-known walls; she too was silent, thus respecting his sorrows; and, oppressed by gloomy thoughts and painful sentiments, she for the first time entered the castle which was to be her future abode.

But her clear good sense soon chased away those disheartening images, and, even when, in the large and half empty halls, in the lofty chambers, where here and there damaged furniture recalled the past devastations, a desponding tendency seemed to seize on her, she resisted it with energy; she took heart, and found occupation for herself; she solaced herself with the bright anticipations of a happy future, when the dear playfellow of her youth, and her future husband, whom she had not seen for so many years, should animate by his presence this deep solitude; and those wishes and hopes which often rose up in her mind would redeem and reconcile everything.

But Count Frederick did not make his appearance. Affairs detained him at Vienna, where he arrived immediately after his father's departure, and where he proposed to arrange the important collections, the fruits of his travels, under the inspection of learned men, before giving himself up finally to his rural retirement. For this Luitgarde upbraided him in her letters, but she endeavoured to employ the time as well as possible; she undertook the management of all the household affairs; gave the necessary directions for the works to be executed for the improvement of the devastated castle; in fine weather she rode through the surrounding country, and in bad weather she was sedulously occupied with her female household; and the evenings were passed at the friendly fireside, with her uncle and the clergyman.

On one of the first days, while yet everything in the castle excited her curiosity, and neither furniture nor painting attracted her observation, she discovered, in a hall through which she was obliged to pass in going from her own apartments to those of her uncle, a portrait of half-size, which strongly attracted her notice; and the more she examined it, the more it fixed her attention. It appeared to represent a subterranean prison, probably a dungeon of ancient times. The foreground of the painting consisted of a retiring range of lofty arcades, which deepened, in the distant background, into terrific darkness; to the right hand of the beholder, still in the foreground, there was, in the highest part, one round opening, through which the light from the moon fell on the person of an imprisoned knight, who, laden with heavy chains, sat on his bed of straw. It was not possible to see his face, from the thick black locks of hair that fell on it, and because his head was turned away from the beholder; but the mournful position of the head, supported by one hand, whilst in the feeble grasp of the other were seen some tallies, on which notches had been made with a rusty nail that lay close by, probably the number of his days of confinement, indicated too clearly the sufferings of the prisoner. The general effect of the composition, seen by the faint light of the moon's rays, produced a painful impression, and filled Luitgarde with mysterious horror. Long did she stand before the painting, and it was with difficulty she could tear herself away; and afterwards, as often as she passed through the hall, she would stop to gaze on it, and to reflect on the sad scene, and the feelings of the forlorn captive, till at last, one evening, she ventured to question her uncle about the painting, and the history of the imprisoned knight. Count Martinitz had little information to impart on the subject; he said that very probably the whole composition was simply a fancy of the painter's, whose name he mentioned;—if, however, it had a foundation in history, as in his youth he had heard it related by his grand-aunt, who was the living chronicle of her house, the portrait represented one of her noble ancestors, who lived in the times of the wars of the Hussites, and who, on account of his religious

opinions, was taken and kept a prisoner by King Sigismund.

"Ah!" said the priest, "those times, like the present, were wicked times!" and, with a sigh, looked up to heaven.

"Yes, indeed!" replied the count; and the two old men now got into deep conversation, upon what was the principal topic at that time, the sorrows and sufferings of their fatherland, and their unhappy consequences upon its children and children's children. The clergyman remarked, in the first place, the brutalization of the people, when pressing want stimulated to deeds of violence, and men's passions were held under no restraint by the fear of God. He spoke of bands of robbers assembled in the forests, consisting partly of deserters or discharged soldiers, that peace rendered no longer necessary, assisted by impoverished and helpless peasants; he knew a number of terrible stories of them. And the count, in whose bleeding heart those subjects found an echo, now reverted to the past, and related the sad events which had taken place in earlier years, from this cruel internecine war.

"One of my friends has lost his only son, the heir of great possessions, and that noble house becomes extinct. Have you, sir, known Count Lansky?"

"Lansky!" exclaimed Luitgarde, who listened attentively.

"Yes," continued her uncle, "Count Lansky, the friend of my youth, who at one time was the intended husband of your mother. Private reasons broke off that plan; Lansky went to his possessions in Silesia, and I have scarcely ever seen him since. He married conformably to the wish of his father, and found his sole consolation for that ill-sorted marriage in the birth of a handsome, promising boy. Then the wave of devastating war rolled over these countries; the savage Mansfeldt, pursued by Wallenstein, marched with the remainder of his bandit troops, cutting his way through Silesia, in order to reach Bethlen Gabor, at the Siebenbirgen. All the horrors and devastations which accompany a flying army, destitute of everything for its support, visited the properties of my friend. Mansfeldt's troops carried fire and sword into the villages; the castle was set on fire; the plunderers broke into it; what the flames did not consume fell into their hands, or under their swords. Thus was lost the son of my friend. In the chamber he had occupied was found the corpse of one of his attendant maids, half consumed by the fire; no one knew what became of the child. Long had the unhappy father cherished the hope that the child, a lovely boy of four years old, might still be found, because his body had not been discovered; but more than twenty years of useless expectation and fruitless researches have at length convinced him that his son had fallen a prey to the flames, and Lansky now lives without a child to inherit his large domains, which since then have never recovered those devastations."

The pastor broke out into fresh complaints and anathemas against the war; a deep sigh rose from Luitgarde's breast; she raised her dark eyes with melancholy expression on her uncle, and said, "Was not the lost boy's name Victorin, uncle?"

"I believe so," replied he.

"My beloved mother has often related to me," she continued, slightly blushing, "of a betrothing—"

Count Martinitz took up the word, and said, "Quite right; you were the destined bride of this Victorin. Since his father could not possess your mother, this ardently desired union was to bring happiness to their children; however you were scarcely born, when heaven, as if to destroy every possibility of a union between our houses, snatched away by death your intended bridegroom."

"Providence has richly repaid me for the loss," replied Luitgarde, with a blush, whilst she placed her uncle's hands to her lips.

"Yes," said the old count, "my Frederick is a noble

youth. I hope, with God's help, he will make you as happy, dear child, as you deserve to be."

"Amen!" said the pastor, devoutly clasping both his hands.

Luitgarde sighed, as she pressed her uncle's hand to her breast, "Ah, if he were but here now!"

With such like conversation were the long autumnal evenings passed, not without pleasure; but, if Luitgarde related much, indeed most of what fell in her way, there was yet one incident which she did not impart to her uncle. Upon one of the first fine days she passed at the castle, she strolled, as was her custom, into the garden, and from thence to the forest close by. A hillock, on which grew a clump of beautiful beech-trees, was the usual limit of her wanderings, from which spot she commanded a fine view of the neighbouring country, and of the river that here wound round the hill. On this day curiosity invited a farther walk; she descended the hillock, and expected easily and without an obstacle to reach the river; but, after a descent of a couple of hundred steps among bushes, she suddenly came on a gaping precipice, under which the Moldaw rushes furiously, with loud breaking noise, hemmed in by narrow and rugged shores.

The wild grandeur of the prospect charmed her; she stood still, and looked down with admiration upon the alternating movement of the waters, which now bubbling up cast its foam on the shore, and now flowed down over higher rocks like a polished mirror. A little boy was playing on the shore, with flat pebbles and all sorts of playthings, which he skilfully threw along the surface of the water with great delight; the light objects at one moment appearing on the point of the waves, at another sinking into the deep. There was a rustling in the thicket near the shore, and a man of tall stature, in dark coloured dress, came out, but in such a way that Luitgarde could not see his face, which was turned towards the river, and stood and looked attentively into the stream; then gently unbuckled his belt, drew with violence a broad sword from a steel scabbard, and stooped down towards the water in order to wash away from it some blood stains, which Luitgarde clearly discerned. The stranger's dress gave no indication to what class in society he belonged; the suddenness, almost wildness of his movement, his sinister exterior, the blood on the sword, all made a disagreeable impression on her mind; and she recalled all the histories of robbers and murderers which the priest had related. Still she could not avoid observing the stranger's lofty, proud air, heightened by his fantastic costume. She remarked the nobleness of his movements, and she remained in a kind of doubtful emotion between terror and admiration, when suddenly a frightful shriek from the boy, who had fallen into the water with his playthings, alarmed her. Luitgarde, at the moment, cried out with anxiety; while the stranger came forward, flung away hat, sword, and mantle, sprang into the river, and drew out the terrified child; then hastily took up his different parts of dress, and, wildly looking around, ran as rapidly as he was able into the thicket. Luitgarde stood amazed, confused at the scene she had witnessed; even the boy looked round in astonishment after his deliverer, but he had disappeared; and this first impression of something unpleasant pressed more forcibly on her mind. Still the unknown had behaved in so noble and manly a way towards the strange child, he could not be a common person;—then he did not wish to be seen;—there was some mystery; and this decided her to ascertain who was the chivalrous preserver of the boy. She did not speak of the accident at the castle, but she liked to recall the event in her solitary hours, and to trace, as much as was possible for her, the rapidly seen features of the stranger, and, from all she had and had not seen, to draw a whole which should explain this singular apparition.

In the mean time the reports of the robber bands extended farther; that they had taken possession of

forests, and devastated castles, and that distress and sorrow were diffused over the whole neighbourhood. The most frightful and strange histories were told of one of those bands, of which the chief was called "the Black Fritz," who was universally acknowledged as the most daring and resolute among them. By some persons he was said to be a Mansfeldt freebooter; others represented him as a swarthy-coloured Italian, who had served in the Cardinal-Infant's troops; and others asserted that he was the son of a charcoal manufacturer of Saxony, who by courage and skill had raised himself to be an officer in the Swedish troops, and that from want and discouragement he had taken to the forests, and become the chief of a troop of hardy adventurers, who meant now to revenge on the unfortunate people, what fate, according to their opinion, had inflicted on them. A crowd of anecdotes were related of this Black Fritz, and of his troop; at one time they were terrific, at another extraordinary, and again sanguinary; never, however, common-place; and all, especially those where the chief himself took a part, bore the stamp of a wild greatness, not without some remains of humanity, indeed often magnanimity, and a daring contempt of every danger.

Luitgarde was never present at such conversations without bringing to her mind the stranger of the shore of the Moldaw; the blood on the sword, the similarity of dress, the swarthy complexion, even the apprehension with which he flew, all appeared to point him out to her as a member of that terrific band, if not indeed the chief himself, the far-famed Black Fritz; and she regretted still more that she had been so little able to distinguish his features. Still she listened with lively interest to all the conversations about him, and, if her right feeling turned aside with horror at the narrated acts of violence, she was not able to suppress a generous pity, arising from the contemplation of so much courage, so much force of character, and daring, joined to a deep regret for the misuse of so much power. She could not but reflect on what these noble endowments might have been under other circumstances, and what was now to be the lot of their possessor, in this world and in the other.

More near and more abundantly did the traces of this band begin to show themselves in the vicinity of Luitgarde's habitation. Count Martiniz thought seriously on active preparations against its attacks, and, during these movements and discussions, there arrived a letter from Count Frederick, which indicated an early day for his arrival. Even at Vienna he had heard the reports that were circulated of the insecurity of the neighbourhood; to him also Black Fritz was represented as a terrific monster, and therefore he took every precautionary measure for his journey; he was accompanied by many domestics, would only take short days' journeys, would never travel by night, and, to clear his road, had escorts placed from the nearest military posts on the most dangerous points. The old count was much pleased at these prudent precautions of his son, whose journey had long disquieted him. Luitgarde was delighted at the near arrival of her early playfellow, the true partner of her solitude, and therefore decided to pay a visit which she had long promised to make to a female friend in the neighbourhood, in order afterwards to enjoy undisturbed the presence and society of her intended husband. The uncle acquiesced; the friend's house was not distant more than two hours' journey, and Luitgarde was to take with her armed domestics. She was to go on the morning of one day, and to return on the morning of the third; and, to avoid all danger, to take the open road over the mountain.

Luitgarde adopted all these recommendations, though in her heart she had no fear. The journey proceeded happily, and, having made her visit, she set out on her return home. She had reached a bad part of the road, which from neglect and autumnal weather had become quite a morass; she had long lost sight of her friend's castle, when, half way up the hill, where the road inclines towards the steep bank of a mountain stream, and when

the horses were scarcely any longer in a state to draw the carriage through the deep ruts, a wheel broke, and all was upset. The lamentations of the maid, the imprecations of the domestics, attracted the attention of a man, who, dressed in the guise of a quiet citizen, came down the hill out of his road; he saw the accident and hastened to the spot, actively laid hold of and drew out the terrified females from the upset coach, whilst the domestics in a state of confusion ran here and there incapable of assisting. The maid sprang into his arms; he set her down on a dry spot, and hastened back to the carriage. Luitgarde had risen; she held out her hand to the stranger—her eye met his, and—a purple glow stole over her cheeks. Never had she seen so handsome, interesting, and manly a countenance; large, dark, brilliant eyes shone under the handsomely arched hazel-coloured eyebrows; a regularly shaped nose descended to finely cut lips, and between dark mustachios appeared teeth white as ivory—whilst he gracefully and in elegant language offered his assistance. The stranger even appeared confused at the aspect of the fair saved one, and Luitgarde easily observed that he treated her with more than ordinary courtesy. He offered his arm to her, conducted her with care, and begged her permission to take her in his arms over a very marshy spot, an offer which she had no alternative but to accept, unless she wished to sink up to the knees. He respectfully took her up in his arms; no intrusive forwardness, no presumptuous look, offended the unprotected position of the maiden; without raising his eyes towards her, without proffering one word, he carried her over, placed her upon the dry edge of the road, and ventured only to retain her until she came to herself, lest, seized by giddiness, she might have fallen into the morass.

When her self-possession had returned, she thanked the stranger in a very obliging manner, who accepted her acknowledgments with evident confusion, and immediately hastened to see what was to be done to the carriage. By advice and assistance he did the best that was possible; he rapidly prepared everything, observed everything; he directed, he commanded the attendants; there was not one who attempted to gainsay him, to whom even it occurred to hold himself back at the stranger's commanding tone; the carriage was put together as well as possible, and led down the hill gently to the house, which the stranger pointed out to them, and where they were to find conveniences, working implements, and helping hands. He now went back to the females, and asked Luitgarde whether she would not wish to go down to the house to rest herself, and wait there with greater convenience until the carriage could be got ready again. The stranger conversed in polished language, and indicated a manner of thinking and habits, that appeared far beyond what his dress announced. Among other things, he asked her why she did not prefer the convenient lower road which led through the forest, as the road over the mountain was always at this time of the year very bad. Luitgarde smiled, and said, after some reflection, "The lower road through the forest must be insecure; my uncle has been afraid of my travelling by it."

"And you, noble lady, are you not afraid?"

"No," replied Luitgarde; "it is said the robber chief, Black Fritz, as he is named, has always correct information on every matter, and so he will have known that a young lady, who travels to visit a friend with a couple of domestics, brings no treasures with her which would be able to attract him."

"Very good, young lady; but Black Fritz must not simply be a plunderer; he must even be audacious and cruel, and often ferocious."

"No," answered Luitgarde with firmness, "I do not believe this,—that, without an object, without the prospect of a rich booty, simply to do harm for its own sake, that man will commit any crime."

"Have you, then, a better opinion of him than the world has?" asked the stranger, doubtfully.

"I have," answered Luitgarde.

"Really!" continued the man, "and why?"

"It may, perhaps, appear singular to you," answered Luitgarde, quietly, as she inferred from the vehemence of the question that he disapproved of her opinion, "it may appear singular to you, but, once for all, I can not believe all the wickedness which is related of Black Fritz."

The stranger stood a moment, and looked at Luitgarde with a peculiar expression. "In truth, noble lady, do you think so?"

"Yes," replied Luitgarde, "although it appears you are not of my opinion, but agree with the multitude;" and now she related to him very affably all kinds of anecdotes she had heard of Black Fritz, and in all of which she imagined she could find, among wild deeds and blameable enterprises, a certain greatness of soul, and no common manner of thinking. Often did the stranger contradict her; he professed to view the robber chief in a very unfavourable light; he appeared to be well-informed of his undertakings; he told her many things that were unknown to her of him, and among others, assured her that he had once been a Swedish officer, had served with distinction, but, at the peace, from mortification and desperation, had taken to his present manner of life; and ended, however, by declaring himself decidedly against him.

"I cannot, indeed, contradict you, since you are so well-informed," said she at last; "but I assure you, I renounce with a heavy heart my better opinion of this man."

The stranger sighed and looked sorrowfully down. "Were men generally capable of so noble a confidence as you, young lady, probably then this wretched man would not have fallen so low."

"Do you think so? now you are, at bottom, even of my opinion, and I can therefore tell you, that more than once I have already with warm heart prayed for him to God, that He might enlighten him, and bring him back from his evil ways to rectitude and virtue."

The stranger appeared violently affected; and Luitgarde, as she was recalling what she said, wondered at herself, how she came then to reply with so much earnestness to a man wholly a stranger to her, whom she saw for the first time, whose name and position were equally unknown to her. But there was something in the deportment of the man which opened her heart as if by force.

LATE HOURS.

"If there be one these lines may teach
A moral, not in vain
Have I endeavoured thus to reach
A more reflective strain."

CHARLES SWAIN.

THE question of late hours is, perhaps, not more a question of philanthropy, than of necessity: good men begin to plead, and impatient ones to clamour, for a relaxation of the present stringent system. The good men plead;—"Give these men time to cultivate their minds, to prepare for a better world." Impatient ones clamour; "We are men, not machines,—we must have rest; the orderly returns of day and night suggest it; our tired limbs and jaded intellects demand it. Are we mill-horses? Were we born without, or are we to quench, every spiritual craving of our nature? Did the poets of our country sing, the painters paint, and the wise men instruct for Englishmen, leaving us out of the question? We have borne it too long; we will bear it no more. Oh, happy days, when old Isaac Walton,

with his six-feet wide shop in Cheapside, could spare time to study the aspects of God's creation!"

The agitation will result in good; employers and employed will be the better for it. We see the end; right must conquer, but it depends on each and all of us, how long first. It is a question which admits of no delay; our brothers are born, and work, and die, while we look on and say, "All will be right in time, only, patience!" Yes; to the brothers, the wives, the families, bereaved through this overworking system, spectators whisper "Patience." Patience is very well when the stone is set rolling from the top of the hill,—we know it must reach the bottom in time; it is a different affair when the folks at the bottom start it,—they must watch and push, and never desert their charge till it be safely fixed on the summit. This is our case; but we will not kick our stone, or be angry with the thousand causes that give it a downward tendency; but "Onward and Upward," must be our motto, and you will forgive a little earnestness in a great cause.

A. keeps a linen-draper's shop in a street in the city: he employs many shopmen; they open at eight, and close at ten. One hour a day is allowed for meals; A. is not very exacting; he is a "moderate" master. B. is a grocer in the next street: he also employs young men, and treats them as well as he thinks he can afford to do; keeps the same hours as A. Both A. and B. might sell all they sell in twelve hours as well as in fourteen. This is the secret—B.'s wife is what is called "a capital manager;" she has a large family, is always at work for them; she snatches a few minutes, after the little ones are in bed, to go shopping. If only B.'s wife did this, her few minutes would be of little consequence, but C.'s and D.'s and E.'s, and many more people's, do the same; the consequence is—the few minutes not in every case presenting themselves at the same time, instead of ending with minutes, the extra time comes to hours. Perhaps A.'s wife and the rest serve B. in a similar way; and so on, through the whole alphabet; so everybody keeps late hours, to oblige everybody, with the important exception of everybody's "young people."

The "young people" say, "Mrs. B. might come shopping in the morning, and mend stockings at night, instead of *vice versa*." Mrs. D. need not lounge about all day, reading a novel, and drop in at seven or eight o'clock, for white gloves to attend a party; Mrs. C. might once now and then spare her servant half-an-hour in the morning to procure herself what she requires." The "young people" are right, but Mesdames A. B. and C. being experienced ladies do not like to be taken to task. Out of spite, or forgetfulness, or indifference, they continue late shopping.

Meantime, the "young people" come from the country, get seasoned, or fade away and die,—nobody seems to care which. So long as Mrs. B. gets her drapery, she does not think of the pale young man who used to wait on her always at A.'s, but has not lately served her. It is not, at this stage of the affair, her business. The pale young man must make his appeal, and Mrs. B. will, perhaps, allow the justice of his claim, perhaps not. Let him not be discouraged; if Mrs. B. stands out, some one else will yield, and the one who yields being, (as she proves herself,) a woman of sense, will influence others. The honest, old, good managers, will become ashamed of overworking other people, for a *supposed* saving of time to themselves, and will give in too. Mrs. B. will be glad she yielded, when Mrs. A.'s "clever" young man, "who has become so attentive to Isabella," is enabled, by his superior intelligence, acquired by early hours, to become a partner in his house. Every one will feel the benefit resulting from the improvement, those most who complain to us now. This is no fiction of social wrong, springing from the fanciful brain of an author. Let any one read the evidence given before the House of Commons, relating only to milliners and dress-

makers, and he will see that this is an injury crying loudly for redress to a Christian people.

This holding human life so cheaply is a crime. I have heard of a mercantile house in London, and shuddered to hear it, who killed off a clerk every six months. It is unimportant how man may look upon such inconsideration; but does the Father of masters and servants view with indifference the supporters of the overstraining system? Let conscience answer.

Mental and physical strength in men go to make a great nation; on our growing up young men we depend for the next generation; each generation helps or retards the progress of England. But how are our young men to acquire strength either of body or mind, when even necessary cessation from toil is denied them? An instrument whose strings are never tightened will get out of tune, but one whose strings are always submitted to excessive tension will soon have none. We plead for the middle, the reasonable, the just course: shall we plead in vain? No; the day will come when the shopmen and shopwomen in London shall have at least an hour or two a day of leisure available for purposes of education. The cathedrals, the picture-galleries, the concert-rooms, the sources of cheap and good education—the newspapers, the magazines, shall be for them. In the economy of the hive, the comfort and convenience of the working-bees shall be consulted. Such a day is coming, all things are tending to it; but perseverance as well as patience must chase away the shadows till

"Jorund day

Stand tiptoe on the misty mountain top."

Let the injured be true to themselves; let them cultivate, to the utmost of their opportunities, the talents they possess, that the cold and distrustful may be convinced, or at least silenced. There are many who have great confidence in the persons to be benefited. I, as one of the hopeful, say, "We do *not* believe that you will misuse additional privileges. We do *not* believe that in supporting this movement for the relaxation of the system pressing so heavily on you, we are diffusing principles which will encourage idleness and dissipation."

We believe that Milton, Shakspeare, and Dryden, will be good company for many a now desolate home; we believe that men will learn to value and to love something beyond the trade that brings them money; we believe that the beautiful and the good will be discovered or cherished in many bosoms, where they are now faintly existing, if existing at all. We *know* that "wisdom is better than rubies, and all the things that may be desired are not to be compared to it;" and we believe that you will seek to obtain wisdom when your opportunities are extended.

The assertion that you would abuse your rights is not only untrue, but insulting to our sense of justice. Am I to rob my neighbour because he wastes his fortune? The steps by which an amelioration of the late-hour system is to be accomplished are these: punctual and faithful discharge of duty; a steady united pursuance of the object in view, maintained through meetings and by the press; a conscientious discontinuance of late shopping by all in any degree interested in the question; and in this commercial country, who among the middle classes is not interested in it?

Employers will find a graceful compliance earn them the thanks of their people, assiduous attention to commands, and additional respect; but all this is more than their due, for it is a question of justice, although their position gives them the power to make it one of favour too. Let them remember, "*Bis dat qui cito dat.*"

TO OUR READERS.

WHEN we made our first bow to our readers this time last year, we then told them how they might easily get rid of us if our presence was disagreeable, or felt to be unnecessary,—by simply letting us alone; that no active steps to expel us would be required; but that, by merely abstaining from troubling themselves about us, they would very soon find themselves relieved from whatever annoyance our periodical call at their doors might occasion. We had no intention of dragging on a sickly existence of a few months under the chilling breath of public neglect. We were fully resolved, if we found a frost fairly set in against us, to walk quietly away, while we had yet toes left wherewith to perform the feat with some degree of decent dignity. A little time must of course always be allowed for the public to know its own mind,—for the engine to arrive at its speed, so as fairly to test its powers,—but after that, if a favourable judgment is not pronounced, the most ardent self-esteem must yield to the conviction that the field which has been entered upon must be left for more skilful hands to till, and for more fortunate adventurers to reap its fruits.

A year has now elapsed, and here we are still, vigorous and hopeful,—a circumstance from which the reader may infer, with truth, that we have not been disappointed with the degree of patronage which we have received. The public has not thought proper to let us alone; we have not been chilled by the cold breath of neglect; the frost has not set in against us; and our toes are warm and sound, and able to carry us forward many a long league, without a wish for, or thought of, retreat. With thankful hearts, therefore, and buoyant hopes; with feelings of sincere gratitude for much favour and indulgence; and with a resolute purpose to deserve more, if possible, but never less, the support we have received; we now gird up our loins, and address ourselves for our third start.

It is a pleasing circumstance connected with a publication of this kind,—most pleasing to us who conduct it,—pleasing also, we doubt not, to those who read it,—that, as we are under no necessity of touching upon subjects of a controversial character, we need never have our minds agitated, or our tempers disturbed, by controversial feelings. This advantage we gain, not by cautiously and *cannily* taking care to express, on all subjects which we treat, opinions so undecided as to oppose no resistance to whoever advances with a disposition to contest them, but by moving entirely above the whole class of subjects about which men usually dispute. We (we do not mean ourselves individually, but our class,) have it in our power, if we adhere to our proper business, to—

a most enviable and delicious privilege, if we can only maintain ourselves at this elevation, nor, by once descending, irrecoverably

“soil our pure ambrosial weeds
With the rank vapours of this sin-worn mould.”

Let it not be supposed that, by laying claim to this elevated region as our proper sphere, we are confessing an unfitness for a mission of every-day practical usefulness. The influences which descend with the most cheering and fertilizing effect upon the ground, are those which have their source beyond the edge of “this visible diurnal sphere;” it is the desolating storm,—the blinding mist,—the poisonous miasma,—which spring from, and have their dwelling close to, the earth. Neither are we to be imagined so absurd as, by fixing our place so high, to arrogate to ourselves any peculiar loftiness of flight, or soaring sublimity of genius. It is not by power of wing, but by pure singleness of purpose in our flying, that the elevation is reached,—by reducing our specific gravity, and by throwing off all downward tendencies, so that “in our proper motion we ascend.”

A metaphor is sometimes a dangerous steed to get astride of, and we therefore descend from ours, lest, were we to remain mounted much longer, our readers should imagine we intended to represent ourselves as always in the clouds, and should feel inclined to institute ludicrous comparisons between the magnificence of our present language, and some paper of very simple plainness, to be found, we doubt not, without much difficulty in our pages, and the generally unpretending character with which it is our study to invest this Magazine. Our meaning, however, cannot well be mistaken. Dealing with subjects not of local, temporary, or party interest, but of universal interest as regards place, time, and persons, our whole aspect and character is necessarily peaceful. We have nothing to do with those things about which men generally quarrel, and for which they call one another names. If we take up an incident of history, it is partly to stimulate at once and satisfy a laudable curiosity, partly to illustrate some point in human character, some prevailing motive to action,—never to bring it to the support of any view of present politics. If we touch upon morals, it is that we may enforce practically that upon which all good men are agreed in theory,—never that we may dip our hands into the disturbed waters of metaphysical or religious polemics. If we speak of the present condition of any class of the people—of its wants—of its sufferings—perhaps of its crimes, it is that we may call into action everywhere those feelings and principles, whose unfettered operation unfaillingly tends, by the admission of all thinking men, to the general good,—never to excite, in any single breast, one angry or discontented feeling. And we have, besides, a wide and fertile field into which

“live inphased
In regions mild of calm and serene air,
Above the smoke and stir of this dim spot
Which men call earth.”

controversy, with its hateful train of paltry jealousies and animosities, can never enter. There is Science in all its varied departments, before whose serene glance every angry feeling is hushed into submissive reverence for truth; there is Fancy, whose light laugh disarms controversy; and Poetry, whose chaste dignity passes it contemptuously by.

If it be said, as probably it will be, that, in thus sketching the character which a Magazine like this ought to bear, the subjects which it should take up, and the manner in which it should handle them, we are inviting a kind of criticism from which, whatever our own opinion may be, the world will scarcely think we can come off with honour, we have a twofold answer. In the first place, the world cannot well have a more humble opinion of us than we have of ourselves, nor be more keenly sensible how far our execution of our plan comes short of our conception of it. But it is something to have such a plan before us,—to have a point in our view which we are continually struggling, though we may be never able, to reach. It is a pledge of a progressive advance towards excellence,—of a daily casting off of some fault or imperfection. And, as it is notoriously but a small part of a publication whose contents are of so miscellaneous a character, the merit of which (whatever that may be) can be claimed by him who has its general management, we can, without offending against modesty or good taste, venture to express our confident persuasion, that, with the assistance which we have secured, this Magazine will be found, as it gets rid of the imperfections and irregularities incident to every newly-constructed instrument, to approach as near to the realization of the *beau idéal* we have sketched, as, looking to its price and expensive decorations, fair and candid criticism can reasonably demand. In the next place, happily for us, the world has already expressed a more favourable opinion, trying us by no low-pitched standard, than the objection we have supposed suggests. We have now before us a whole bundle of opinions—not one of them the mere *quid pro quo* of a venal criticism—the return in kind for the favour of an advertisement—but *bona fide* discriminating judgments, marked by the taste, good sense, and ability by which the newspaper-press of the present day is, generally speaking, so remarkably distinguished, in which our labours are spoken of in terms to which, were it not that much the greater part of the praise must be dealt out to contributors by whom we are proud to be assisted, we should almost blush to refer. These favourable opinions, we may add, have been not the less valued, that they have been in many cases accompanied by criticisms and suggestions, by which we have used our utmost endeavour to profit.

May we be permitted here to recapitulate the claims which we conceive ourselves to possess upon the support of the various classes of the public.

To parents and guardians, and those who are

entrusted with the education of the young, we commend our work in an especial manner, as one peculiarly fitted to promote their wishes in the training of those under their charge. It will not teach them all that they must know; it is not its purpose to do so; no Magazine can do so; and those under whose charge they are placed will of course carefully guard them against the mistake of expecting from it, or from any similar publication, what can only be obtained by severe study and unwearying application, from books of probably a less inviting character. Its use in their case will be to incite them to, and prepare them for, those severe studies, in a way suited to their several dispositions, while at the same time furnishing a profitable relaxation from occupations, which, if unremittingly pursued, would crush the feeble, disgust the indolent, and wear out the prematurely expanded energies of those whose genius is of a higher cast. Such as cannot be prevailed upon to go any further will, if they read this Magazine, find they have gained some knowledge, and that not little; for it will be the result of a great deal of that severe study which they themselves decline. But to those of the young whose curiosity is ardent, and their love of knowledge sincere, it will open up continual glimpses into the wide field which lies before them, furnishing hints and suggestions by which they will be sure to profit, at once stimulating and directing them in the noble pursuit. And all this without a line or a word from which they can suffer injury, by which the fine edge of early sensibility can be blunted, the generous ardour of youth for what is good and noble damped, or its reverence for what is venerable by age, character or profession weakened; but, on the contrary, with much by which all these can be strengthened and improved.

Clergymen, whose interest in the welfare of their flocks is not limited to the performance of their peculiar and sacred duties, will find, we trust, in this Magazine, what they can safely place in the hands of the people over whose spiritual interests they watch, in full security, that, while they are giving them what will be a source of much harmless enjoyment,—what will add greatly to their knowledge of men and their doings, of nature and its works,—it will never weaken the hold which they, or the doctrines they preach, have upon their affections—will not raise on their faces one sneer at the holy mysteries of our faith, nor suggest one doubt regarding the sure foundation of our hopes.

To the rich, *eo nomine*, we have not much to say, except to beg them not to despise us because of the lowness of our price; nor to cast aside contemptuously a work of which neither the appearance, nor, may we be permitted to say, the intrinsic qualities, are unworthy of a place on their drawing-room tables, merely because it is sold so cheap as to admit of its being also found in the cottager's window. We shall not presume to say that we can instruct them; but we promise them amusement and gratification of a character not out of harmony

with the tastes and associations of men of cultivated minds and manners.

But to those who are not rich we make an especial appeal. They are not often addressed as patrons. They can be patrons to us. Our price has been fixed for their sakes at a sum so low as to be extremely hazardous to ourselves. Those who can afford little else can afford this Magazine, and thereby obtain access to what would otherwise have remained hopelessly closed against them for ever. For their sakes we extract the essence of works which the savings of a lifetime could scarcely enable them to buy, and lay before them treasures of knowledge and art which were formerly the exclusive enjoyment of the rich. We come to them with our price as to the poor, but with nothing else. We assume no supercilious airs of bringing ourselves down to the level of their capacities and their tastes. We do not insult them by imagining that they will not relish a style of writing and thinking with which we do not fear to approach the richest and noblest in the land. Our writings may, and we trust will, help to raise them in the social scale; but will never be so conceived as to degrade them in their own esteem.

In one word, ours is a theatre in which the performances are carefully selected to suit the taste of the boxes, with admission to the whole house at gallery price.

To all our friends we say—Go on as you have done. Continue to support us as you have supported us during our first year; and our exertions for your advantage and gratification will be as unwearied as our gratitude will be boundless.

Popular Drar-Book.

November.

THE name of this month was assigned to it in the Alban Kalender, and is taken from *novem*, nine. November, as its title denotes, was originally the ninth of the twelve months; it is now the eleventh. Diana was considered its tutelary deity. The Saxons styled it *wint-monat*, i.e. wind-month; and it afterwards obtained the appellation of *blot-monat*, or blood-month, to denote that it was usual at this period of the year to kill oxen, sheep, and hogs, for purposes of sacrifice, and for food during the ensuing winter; artificial pasturage, drying of grass into hay, &c. having been then unknown. The stock of salted meat prepared was to last until vegetation again became sufficiently forward to permit the resumption of the use of fresh provisions. "The custom," says Brady, "of salting meat at this season, for winter consumption, was universal in this island, and throughout all the nations on the continent of Europe. In Scotland it was generally in use within the memory of man, and is still practised in the highlands. We have yet our *Martlemass*, or *Martinmass* beef, or beef cured about the festival of St. Martin, on the eleventh of this *blot-monat*. And the Spanish proverbs of 'His Martinmass will come, as it does to every hog,' and 'His Martinmass is coming, when we shall be all hogs alike,' that is, meet the same fate, emphatically allude to the slaughter of swine at this period. To the change from the use of salted to that of fresh meat, joined to the advantage of the vegetable

productions, now common throughout the year, is principally to be ascribed the almost total extirpation of leprosy, which formerly made such havoc among mankind; though the introduction of linen, tea, and tobacco, are considered as having contributed very much to that happy effect."

November was anciently represented as a man clothed in "a robe of changeable green and black: or, as it is usually termed, *shot-coloured*;" his head adorned with a garland of fruit and olive branches, holding in his left hand turnips and parsnips, and in his right the sign *Sagittarius*, or the *Archer*, which the sun enters on the 22d of this month; "thereby emblematically expressing that the cold ether, which in the former month was gaining a predominance over the sun's heat, now *shot and pierced* its way into the pores of the earth and suspended vegetation." Our great Elizabethan poet writes:—

"Next was November; he full-grown and fat,
As fed with lard, and that right well might seem,
For he had been a fattening hog of late,
That yet his brows with sweat did reek and steam,
And yet the season was full sharp and breu;
In planting eke he took no small delight:
Whereon he rode, not easy was to deem,
For it a dreadful centaur was in sight,
The seed of Saturn and fair Nais, Chiron light."²

This is generally a windy, gloomy, and foggy month, "in which," remarks Leigh Hunt, "we are said by Frenchmen to hang and drown ourselves." Intervals of clear and pleasant weather, however, frequently occur. The writer above quoted observes: "There are many pleasures in November, if we will lift up our matter-of-fact eyes, and find that there are matters of fact we seldom dream of. It is a pleasant thing to meet the gentle fine days that come to contradict our sayings for us; it is a pleasant thing to see the primrose come back again in woods and meadows; it is a pleasant thing to catch the whistle of the green plover, and see the green-turtles congregate; it is a pleasant thing to listen to the deep amorous note of the wood-pigeons, who now come back again; and it is a pleasant thing to hear the deeper voice of the stags, making their triumphant love among the falling leaves."

In November the mornings are often somewhat frosty, but the thin ice soon vanishes after sunrise. As the preceding month was marked by the *change*, so this is distinguished by the *fall* of the leaf. There is something extremely melancholy in this gradual process, by which the trees are stripped of all their beauty, and left so many monuments of decay and desolation. They usually lose their foliage in the following succession:—walnut, mulberry, horse chestnut, sycamore, lime, ash; then, after an interval, elm; then beech and oak; then apple and peach trees, sometimes not till the end of the month; and lastly, pollard oaks and young beeches, which retain their withered leaves till pushed off by their new ones in spring. Wild animals put on their winter coats in November; and the Alpine hare, which abounds in Scotland, becomes white. Lizards, badgers, and the hedgehogs creep into holes in the earth; bats get into old barns and caves; squirrels, rats, and field-mice shut themselves up with their hoarded provisions; dormice begin their long annual sleep; frogs hide themselves in the mud at the bottom of ponds and ditches; and moles make the nests in which they lodge during the winter. Flocks of wood-pigeons, or stock-doves (the latest in their arrival of the birds of passage,) appear at the end of the month, before which silk-tail, golden plover, and pocher are seen. Salmon now ascend the rivers to spawn. Their force and agility in leaping over cataracts and other obstacles to their ascent are very surprising. They are frequently taken in this attempt by nets and baskets placed directly below the

(1) Fierce.

(2) Named.

fall, into which they are carried after an unsuccessful leap.

Our gardens retain a number of the flowers of last month; and, in addition to several of the flowering trees and shrubs, they have the fertile and glowing China-roses in bloom; and in fruit the pyracantha, with its lustrous red berries, that cluster so beautifully on the walls of cottages. November is a busy farming month. The husbandman finishes his ploughing and sowing; winter fallows are turned up, and the fields drained; cattle and horses are kept in the farm-yard or stable; sheep are sent to the turnip-fields, or, in bad weather, fed with hay; bees are put under shelter, and pigeons fed in the dove-house. Threshing begins, forest and fruit trees are planted, and timber felled.

November originally consisted of thirty days, which were continued both by Romulus and Numa. Julius Cæsar gave it thirty-one, but Augustus reduced it again to thirty, which it has ever since retained.

November 1.—Feast of All Saints.

"Because," says Bishop Sparrow, "we cannot particularly commemorate every one of those saints in whom God's graces have been eminent, for that would be too heavy a burden; and because in those particular feasts which we do celebrate we may justly be thought to have omitted some of our duty through infirmity or negligence; therefore holy church appoints this day in commemoration of the saints in general." This festival, also called the Feast of Allhallows, is celebrated by the Latin and English churches. Its origin is referred to the year 607, when Phocas, the emperor, wrested the Pantheon from the pagans, and bestowed that splendid edifice upon the faithful. In A. D. 837, Gregory the Fourth, at the wish of Louis *le Debonnaire*, altered the anniversary of this feast from the first of May to the first of November, where it has remained until the present time; assigning as the motive of such change, that, as the harvest was then gathered in, less inconvenience would arise from the vast concourse of pious poor who resorted to Rome, for the purpose of joining in devotion at this high festival. "Allhallows Day," remarks the author of *Morus*, "closed the festivity of the harvest. As the labourer and vintager had now received the fruit of their pains, so it was proper that the labourers in the Lord's vineyard should be honoured with praises. The face of the country was now changed by the advance of the year, and the success of the husbandmen; the fields were naked, the leaves were falling fast from the trees, the dark clouds poured down rain, and brooks were swollen to rivers. All Halloween Day was the last joyful feast of the year."

OLD AND POPULAR CUSTOMS.

On this festival, in many parts of England, apples are ducked for, and nuts cracked, &c., as upon its vigil, Allhallow Eve. Tollett relates, "that on All Saints' Day, the poor people in Staffordshire, and perhaps in other country places, go from parish to parish *a-souling*, as they call it; i.e. begging for *soul cakes*, or any good thing to make them merry." Another writer observes that in the county of Monmouth a custom prevails among the lower classes of the inhabitants, both Romanists and Protestants, of begging bread for the souls of the departed on the first of November; the bread thus distributed is called *dole bread*. This is, no doubt, the same antique usage as is thus referred to in the "Festival" (printed in 1511):—"We read in old time good people would, on Allhallowen-day, bake bread, and deal it for all Christian souls." We shall have occasion to say more about this subject in our notice of All Souls' Day. The first of November was considered among the ancient Welsh as the conclusion of summer, and celebrated by them with bonfires, accompanied with ceremonies suitable to the event. A writer in 1788 speaks of a custom observed in some parts of England "among the Papists, of illuminating

some of their grounds upon the eve of All Souls, by bearing round them straw, or other fit materials, kindled into a blaze. The ceremony is called a *Tinley*, and the vulgar opinion is that it represents an emblematical lighting of souls out of purgatory."

November 2.—All Souls' Day.

"The memory of the departure of all Christian souls," writes an old author, "is established to be solemnized in the Church on this day, to the end that they may have general aid and comfort, whereas they may have none specially." Odillon, Abbot of Cluny, in the ninth century, first enjoined the ceremony of praying for the dead on this day in his own monastery; and the practice was partially adopted by other religious houses until the year 998, when the feast of All Souls was appointed throughout the Western Church. "To mark," says Brady, "the pre-eminent importance of this festival, if it happened on a Sunday it was not postponed to the Monday, as was the case with other such solemnities, but kept on the Saturday in order that the Church might the sooner aid the suffering souls, and that the dead might have every benefit from the exertions of the living. The remembrance of this ordinance was kept up by persons dressed in black, who went round the different towns, ringing a loud and dismal-toned bell at the corner of each street, every Sunday evening during the month of November; and calling upon the inhabitants to remember the deceased suffering the expiatory flames of purgatory, and to join in prayer for the repose of their souls. This custom was general in this country until the Reformation was completely established."

OLD AND POPULAR CUSTOMS.

In the *Gentleman's Magazine* for November, 1784, it is stated that at the village of Findern, Derbyshire, the boys and girls go every year in the evening of the 2d of November to the adjoining common, and light up a number of small fires amongst the furze growing there, and call them by the name of *Tindles*: this usage has long been discontinued. "In Wales," relates Pennant, "they have a custom of distributing *soul cakes* on All Souls' Day, at the receiving of which poor people pray to God to bless the next crop of wheat." On this day formerly, in Lancashire and Herefordshire, it was usual for wealthy Romanists to dispense oat cakes, called *soul-mass-cakes*, to the poor, when, by way of expressing gratitude, the partakers of this liberality offered the following homely benediction:—

"God have your soul,
Bones and all."

Aubrey relates that, in his time, in Shropshire, &c., there was set upon the board a high heap of soul-cakes, lying one upon another like the picture of the shew-bread in the old Bibles. They were about the bigness of twopenny cakes, and every visitant on the feast of All Souls took one. He adds, "There is an old rhyme or saying, 'A soul-cake, a soul-cake, have mercy on all Christian souls for a soul-cake.'"

RELIGIOUS OBSERVANCES.

All Souls' Day was formerly devoted in England to prayer and masses for the dead, and to the remembrance of the death which awaited the living. The altars were hung with black, men kneeled upon the graves of their relations, and strewed them with flowers, and held lonely vigils, and strengthened their own hearts. During this lugubrious festival, it was the custom, as in Italy at present, for every one to appear in mourning. "When that ghostly era arrives," says Mr. Digby, "a devout multitude leaves every city, and repairs to the holy field for the dead, bearing lighted torches, to assist at the benediction there given solemnly. The poor, the lame, the blind, meekly and in silence line the ways, and alms are largely given to them. After the

office each family visits its ancestral tomb and prays for the souls of its members departed. All that night the bells of the churches and monasteries send forth a solemn peal. In some places, as at Bayeux, in consequence of the affluence of the people there was the fair of the dead."

November 5.—Guy Fawkes's Day.

This is the anniversary of the GUNPOWDER PLOT. "This," writes Hone, "is a great day in the Calendar of the Church of England: it is duly noticed by the almanacks, and kept as a holiday at the public offices." Appended to the "Book of Common Prayer" is "A Form of Prayer, with Thanksgiving, to be used yearly upon the fifth of November, for the happy deliverance of King James I., and the three Estates of England, from the most traitorous and bloody-intended Massacre by Gunpowder." The particulars of this execrable plot and its discovery are too well known to require any relation in these pages.

POPULAR CUSTOMS.

Poor Robin's Almanack for the year 1677 contains the lines on the fifth of November:—

"Now boys with
Squibs and crackers play,
And bonfires blaze
Turns night to day."

"It is still customary," observes Brand, "for the boys to dress up an image of the infamous conspirator, Guy Fawkes, holding in one hand a dark-lantern, and in the other a bundle of matches, and to carry it about the streets, begging money in these words,— 'Pray remember Guy Fawkes!' In the evening there are bonfires, and these frightful figures are burnt in the midst of them." The following stanza is ordinarily shouted before every house by the retainers of the effigies above described:—

"Please to remember the fifth of November,
Gunpowder treason and plot;
We know no reason why gunpowder treason
Shall ever be forgot.

Holla, boys! holla, boys! huzza - a-a-a!"

"Scuffles," remarks Hone, "seldom happen now; but in my youthful days, 'when Guy met Guy, then came the tug of war!' The partisans fought, and a decided victory ended in the capture of the 'Guy' belonging to the vanquished. Sometimes desperate hands, who omitted or were destitute of the means to make 'Guys,' went forth, like Froissart's knights, "upon adventures." An enterprise of this sort was called "going to smug a Guy;" that is, to steal one by "force of arms," fists, and sticks, from their rightful owners. In such times, continues our informant, the burning of "a good Guy" was a scene of uproar unknown to the present day. The bonfire in Lincoln's-inn-fields was of this superior order of disorder. It was at the Great Queen-street corner, immediately opposite Newcastle-house. Fuel came all day long, in carts properly guarded against surprise. Old people have remembered when upwards of two hundred cart-loads were brought to make and feed this bonfire, and more than thirty "Guys" were burnt upon gibbets, between eight and twelve o'clock at night. At the same period, the butchers in Clare Market had a bonfire in the open space of the market, next to Bear-yard, and they thrashed each other "round about the wood fire" with "the strongest sinews of slaughtered bulls." Large parties of butchers from all the markets paraded the streets, ringing peals from marrow-bones-and-cleavers, so loud as to overpower the storms of sound that came from the rocking belfries of the churches. By ten o'clock, London was so lit up by bonfires and fireworks, that from the suburbs it looked in one red heat. Many were the overthrows of horse-men and carriages, from the discharge of hand-rockets, and the pressure of moving mobs inflamed to violence

by drink, and fighting their way against each other. This fiery zeal has gradually decreased: men no longer take an interest or part in such an observance of the fifth of November in the metropolis, and the tumultuous proceedings, &c. above described, have long since fallen into desuetude.

At almost every village in England this day is still celebrated with bonfires and rejoicings.

Biographical Sketches of Eminent Painters.

VANDYCK.

THE celebrity of this eminent artist arises chiefly from the excellence of his portraits, in which branch of the art he has been compared to Titian.

Anthony Vandyck was born at Antwerp, on the 22d of March, 1599; and it is a singular coincidence that the much-admired Spanish painter, Velasquez, was born in the same year.

Vandyck's father painted on glass with some skill, and his mother excelled in embroidery. His first instructor was Hendrick Van Balen, who had studied the works of the great masters in Italy; but Vandyck soon rivalled his preceptor, and, being an ardent admirer of Rubens and his works, he placed himself under the guidance of that illustrious man, who conceived a great affection for him, and foresaw his future excellence.

Vandyck improved rapidly, and became very useful to his master, whose manner he copied so well, that many of his productions have been ascribed to Rubens. The following anecdote affords a proof of Vandyck's powers of imitation in that respect.

It was the custom of Rubens, when the labours of the day were ended, to go out towards evening, and enjoy the relaxation of exercise in the air. On these occasions his pupils sometimes obtained permission from his old servant, Valviken, to enter Rubens's cabinet, and examine his different sketches, and his method of finishing his pieces. It happened, one day, when the young men were all eagerly pressing forward to observe a picture which Rubens had been painting during the morning, that one of them stumbled against the object of their curiosity, and effaced the arm of a Magdalen, and the cheek and chin of a Madonna. The accident excited general alarm, and the whole school appeared lost in confusion and dismay, when John Van Hock exclaimed, "We have no time to lose; we must find some expedient to screen us from discovery. Let the most skilful among us endeavour to repair the mischief we have occasioned. I, for one, give my voice for Vandyck, the only one capable of succeeding." This suggestion was unanimously approved of. Vandyck alone hesitated; but the entreaties of his companions, and his dread of encountering the anger of Rubens, induced him to comply; and he performed his task so well, that, the next day, Rubens, on examining the picture, said to his pupils, "That arm and head are among the best things I ever did."

Many have asserted, that, when Rubens was at length apprised of the circumstance, he effaced the whole; whilst others maintain that he suffered it to remain as Vandyck had finished it. The picture was the celebrated Descent from the Cross, in the cathedral of Antwerp.

In his twentieth year Vandyck went to Italy, by the advice of Rubens. On leaving Antwerp, he presented his kind friend and master with three excellent pictures. One was the portrait of Rubens's wife: the second was an *Ecce Homo*; and the third represented our Blessed Saviour in the Garden of Olives, when the Jews came to take him. Rubens valued these paintings highly, and placed them in his best apartment. The last, in which the figures were extremely well designed, beautifully coloured, and the effect of torchlight most powerfully displayed, Rubens placed over the chimney-piece, and always bestowed upon it the highest encomiums. In return, he gave Vandyck one of the finest horses he possessed; and, in his celebrated picture of St. Martin dividing his cloak with a mendicant, Vandyck has painted himself mounted upon that horse.

After having visited Rome and other parts of Italy, Vandyck took up his abode at Venice, where he studied the superior productions of Titian and Paul Veronese; and acquired that facility of outline, and delicacy of manner, by which his pictures are distinguished.

He observed minutely every tint in the works of Titian, and, by the superiority of his genius, he was enabled to discover the true principles which guided the celebrated masters of the Venetian school to the high degree of excellence which they attained.

On quitting Venice he repaired to Genoa, and, whilst there, his reputation and pecuniary advantages increased rapidly.

After a short visit to his native country, where he was warmly applauded by Rubens, and other eminent judges,—though he was assailed by the jealousy and envious criticisms of inferior artists,—he went to the Hague, where he painted the portraits of the Prince and Princess of Orange, their children, and most of the nobility, ambassadors, and wealthy merchants. He was highly paid for these portraits, in which, as in all he painted, he united the perfection of the art with the charm of truth.

At length, having heard how liberally the fine arts were patronized in England, he departed for London. There he painted some admirable pictures; but, strange to say, he met with so little encouragement, that he returned to Antwerp disappointed and disgusted.

He then resolved to retrieve the time which he said he had lost in other countries, and to signalize his return home by some of his best productions; amongst which was a picture of the crucifixion. He also painted a St. Anthony, at this period, for the Infanta of Spain.

Some excellent engravings from his works having found their way to England, a general regret was felt that greater regard had not been evinced for his uncommon talents; and Charles I. sent him a pressing invitation to visit his court.

Vandyck was at first unwilling to return to a country where he had been so unfavourably received, and it was only at the urgent solicitation of Sir Kenelm Digby that he consented to accompany him.

The king received him most graciously, and presented him with a gold chain, and the royal portrait richly set in diamonds. Soon afterwards his majesty conferred on him the honour of knighthood, and allowed him a considerable pension.

Apartments at Hampton Court, and in the palace of Eltham, were likewise given to him. Vandyck proved himself worthy of the king's munificence, for in a short time he enriched this country with many chefs-d'œuvre, and supplied the continual demand for portraits, not only for the galleries in the royal palaces, but for noble and wealthy families. The king often condescended to visit the artist, and took great delight in conversing with him.

Vandyck's portraits of the unfortunate Charles, his Queen, and family, are very numerous; and it is observable that those of the king have all that melancholy cast of countenance for which his majesty was remarkable, even before those calamities which might naturally have produced it. But Vandyck has represented him as handsomer than any other painter has done.

The artist's prosperity was now very great, but he was unreasonably expensive in his habits. He kept brilliant equipages, and a sumptuous table, to which all his friends and acquaintance were welcome. His establishment of domestics and horses equalled that of any nobleman of that period; but his gains were so great that he might have continued even these superfluous expenses, had he not absurdly wasted his money and his time in the pursuit of Alchemy.

He built a laboratory at a great expense, and the gold which was hardly and honourably earned by his pencil, soon evaporated in the crucible. The fumes from the coal, and grief at finding his attempts fruitless, added to the irregularity of his life, produced an illness which appeared likely to terminate fatally. He recovered, however, and some time afterwards he married, with the sanction of the king, one of the handsomest women of the court, the daughter of the Earl of Gowrie, a Scottish nobleman.

Vandyck went to Antwerp, after his marriage, with his wife, on a visit to his family and friends; and thence he proceeded to Paris, with the intention of offering to paint the Gallery of the Louvre; but Poussin was already engaged for that undertaking; therefore, after a sojourn of only two months in the French metropolis, he returned to London. His state of health soon became alarming, and he gradually sank under an accumulation of diseases. It is said that the king promised to give his physician three hundred guineas if he could save Vandyck's life. But his complaints were beyond the reach of medical skill, and he expired in 1641, at the age of forty-two, and was buried with funeral honours in St. Paul's cathedral.

He left a widow and one daughter, who married Sir John Stepney, a gentleman of good family in Wales. Her mother was re-married to Sir Richard Pryce, of Coguthan, in Cardiganshire.

Vandyck was a remarkably rapid painter. It is well known that he would commence a head in the morning, and, in order not to delay his work, he generally invited the person who sat to him to dine with him, and in the afternoon he finished the picture. He seldom retouched a piece after the first day.

He gave to his heads an appearance of nature and truth that could not be surpassed, and he excelled in painting the hands, which were always beautifully formed, and delicately exact in their proportions. His power of expression was so

striking, that the character and feelings of the person seemed, as it were, visible in the portrait.

The attitudes of his figures are natural and graceful; his colouring is much to be admired; and his draperies, which were taken from the fashion of the period, are in a grand yet easy style.

His best portrait, in England, is said to be that of the Earl of Strafford, at Wentworth House.

Though Vandyck is generally considered as a portrait painter, yet he has nearly approached his great master, Rubens, in some of his historical pictures. He had, it is true, less genius and spirit, but he excelled Rubens in the delicacy of his tints, and the vivacity of his colours. This was acknowledged even by his enemies, on the occasion of the exhibition of the picture which he painted for the church at Antwerp, in which is represented our Saviour lying dead on the knees of his mother, and surrounded by angels.

However it must be admitted that he was generally inferior to Rubens in historical subjects, though he surpassed him in his portraits, which, says De Piles, "have a softness and freedom of penciling beyond anything else in that way."

The most capital works of Vandyck are in England.

DESCRIPTION OF A SIBERIAN SHAMAN.

THE writer from whom we transcribe the following description of a Shaman, is treating of somnambulism, ecstasy, and quotes, as instances of it, the conjurers or wizards of Lapland and of Samoyede, and the Shamans of Siberia, who bring themselves into this singular state by artificial means, such as whirling round of the body, especially of the head, accompanied by stunning cries, songs, and music. "The condition," says our author, "into which the Shaman brings himself is much more extraordinary than that of the Lapland seer or the Samoyede enchanter: it resembles more what we might imagine the state of an ancient Pythoness, being a kind of convulsive delirium, during which he utters dark and oracular sentences, and remarkable clear seeing, or prophetic sight, takes place." An interesting account of these Shamans is given by a companion of Wrangel, in his expedition to the North Pole, contained in a letter written by Mr. Matinschkin to a friend at Petersburg, dated December, 1829.

This gentleman, after wandering all day by the banks of the Siberian river, Tobalog, sought shelter from the snow (which was beginning to fall, though only the month of August) in a place, where he found assembled a great many persons around a Shaman, who was just on the point of commencing his incantations.

By means of one of the company, to whom Mr. M. had lately shown a trifling kindness, and by the promise of some brandy and tobacco, our traveller was permitted to remain and witness the proceedings.

"In the centre of the place a bright fire blazed, around which a circle was marked out by black sheepskins, on which, in slow and measured steps, the Shaman moved round, repeating, at the same time, half aloud, the forms of his incantation. His long, black, bristly hair, covered almost completely his red and swollen face, while from under the shaggy eyebrows gleamed a pair of blood-shot eyes. His dress was a long Talar, composed of the skins of animals, and hung from top to bottom with amulets, rhymes, chains, shells, and pieces of iron and copper. In his right hand he held a charm-drum in the shape of a tambourin, likewise ornamented with shells. In his left hand was an unbent bow.

"By degrees the flame of the fire became extinguished, leaving only the glowing embers, which throw a dim mystic sort of light around. The Shaman threw himself down on the ground; and, after remaining motionless for about five minutes, broke out into a melancholy wail, the sound of which was as if it came from different voices. The fire was again kindled, and shot up into a high flame. The Shaman then sprang up, placed one end of the bow on the ground, rested his forehead on the other, and still holding the bow in his hand, he began to whirl round it, first slowly, and then rapidly. This whirling continued until the very sight of it made me giddy, when suddenly he stood still, and commenced making all manner of figures in the air with his hand without exhibiting the slightest symptom of giddiness. He then seized his drum, and, in a sort of inspiration, played, what seemed to me, a sort of melody, while he quickened or slackened his pace, and moved and contracted his body with inconceivable rapidity. The motion of the head was especially striking; it whirled round with a velocity resembling a ball on a string.

"During these operations the Shaman took, now and then, a mouthful of brandy and a whiff of tobacco, which, at a sign given by him, was handed to him by some one of the bystanders. This and the other operations must at length have stupefied him, for he fell suddenly down, and remained rigid and seemingly lifeless. Two of the spectators then approached, with large knives in their hands, which they began to, what on each other close to his head. This seemed to bring him again to himself; he renewed his strange wailings, and moved his body slowly and convulsively. The persons who had the knives in their hands raised him up, and placed him in an erect posture. His countenance was horrid to look at; the eyes were as if starting from their sockets, and seemed to project out from the head, while his face was crimson all over. He appeared perfectly unconscious, and except a slight tremor of the body, he remained for some minutes without a sign of life.

"He then awoke from his stupor apparently, and supported himself by his right hand on his bow, while, with the left, he swung the drum rapidly round his head with a whirling noise, and then suddenly let it fall, which, I was informed, was the sign that he was now fully inspired, and ready to be questioned. I approached him, as he stood motionless before me, without token of life either in eye or countenance, while neither my questions, nor his answers (which were given instantly, without one moment's reflection) changed in the slightest degree the immobility of his features. Several of his answers were very remarkable; others so obscure, that none of the interpreters were able to give me them in Russian. When the curiosity of all had been satisfied, the Shaman again fell into convulsions, accompanied with internal spasms, lying thus on the ground for about a quarter of an hour." The demons, it would appear, took a much shorter time to effect their exit than their entrance; as, for the latter, four hours had been necessary. Besides their usual mode of departing—by the chimney—the traveller saw the door opened by the spectators to let them out that way if they preferred it.

"At length, all was finished; the Shaman arose with marks of astonishment in his countenance, like a man awakened out of a deep sleep, finding himself in the midst of a large assembly. He looked at all the people around him, and particularly at Mr. M., whom he seemed now to see for the first time. Mr. M. asked him to explain some of his dark sayings, but the Shaman only looked at him with a questioning expression of countenance, as if he knew nothing of what had happened, and shook his head at each interrogatory, being utterly oblivious of what had passed, or of what he had said."

Our author is of opinion that the religious ceremonies of the dervishes of the present day had, in their origin, the same end in view as the demon-conjurings of the

Siberian Shaman, namely, that of inducing a somnambulous cataleptic state; but that now, the former not carrying out their whirling and other stupifying operations to the same extent as was once done, these ceremonies have become mere senseless and unmeaning rites; the Dervishes themselves being now ignorant of the purpose meant to be accomplished by their singular religious services. Three, however, out of the thirty-two orders into which the Dervishes are divided, the Meldeve, the Bedive, and the Rufai, still practise the whirling to a much greater extent than any of the others; their movements, accompanied by a barbarous kind of music, and various other ceremonies, while they call out in a voice of increasing loudness, "Allah! Hu!" until, breathless and exhausted, like the Shaman, they fall into a state of utter insensibility. After a few more absurd practices, they are then blessed by their chief, "Sheik Uliam," as he is sometimes called, (meaning Chief of the True Believers,) and speedily recover.

A. R. L.

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

THE THREE VOICES.

S. M.

WHAT smith the Past to thee? Weep!
Truth is departed;
Beauty hath died like the dream of a sleep,
Love is faint-hearted;
Trifles of sense, the profoundly unreal,
Scare from our spirits God's holy ideal—
So, as a funeral bell, slow and deep,
So tolls the Past to thee! Weep!

How speaks the Present hour? Act!
Walk, upward glancing;
So shall thy footsteps in glory be track'd,
Slow, but advancing.
Scorn not the smallness of daily endeavour;
Let the great Meaning enoble it ever;
Droop not o'er efforts expended in vain;
Work, as believing that labour is gain.

What doth the Future say? Hope!
Turn thy face sun-ward!
Look where light fringes the far-rising slope—
Day cometh onward!
Watch! Though so long be the twilight delaying,
Let the first sunbeam arise on thee praying;
Fear not, for greater is God by thy side,
Than armies of Satan against thee allied!

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

RISE OF THE THERMOMETER.

THE cold during the winter nights is very severe. The sentinels are frequently obliged to be relieved every half hour, and the officers, so long as they are beardless, may enjoy horizontal refreshment in peace; but when they obtain those manly appendages yclept whiskers, they find that turning in bed becomes hopeless, and being "brought up with a round turn," discover that they are frozen to the sheets. And we are told that families have been awakened by their houses becoming

roofless, owing to the intensity of the frost having extracted the nails by which the shingles were fastened to the rafters. Provisions are brought into St. John's frozen hard, and they will keep perfectly well so long as the frost lasts; it is ludicrous enough to see pigs, hares, and large codfish frozen stiff, and carried by a leg or tail over a man's shoulder, like a musket. One evening a discussion as to the degree of cold led to a bet, and the commanding officer's orderly was sent to ascertain what the thermometer stood at outside the window. The major's servant ingeniously brought the thermometer into the room, and looked at it by the light of the fire; the mercury thus suddenly astonished, naturally ran up a tremendous pace. In the conversation which took place between him and the orderly, he was overheard exclaiming, "Wait till it stops, Bob! Now tell the major it is at 45 notches above *Nero*."—*Echoes from the Backwoods*.

ANECDOTE OF LORD ERSKINE.

WHEN induced to make a personal observation on a witness, Erskine divested it of asperity by a tone of jest and good humour. In a cause at Guildhall, brought to recover the value of a quantity of whalebone, a witness was called of impenetrable stupidity. There are two descriptions of whalebone, of different value, the long and the thick. The defence turned on the quality delivered; that an inferior article had been charged at the price of the best. A witness for the defence baffled every attempt at explanation by his dulness. He confounded thick whalebone with long in such a manner that Erskine was forced to give it up. "Why, man, you don't seem to know the difference between what is thick and what is long. Now, I'll tell you the difference. Now, I'll tell you the difference. You are a thick-headed fellow, and you are not a long-headed one!"—*Townsend's Lives of Eminent Judges*.

THERE is no small degree of malicious craft in fixing upon a season to give a mark of enmity and ill-will; a word—a look, which at one time would make no impression—at another time wounds the heart; and, like a shaft flying with the wind, pierces deep, which, with its own natural force, would scarcely have reached the object aimed at.—*Sterne*.

WHO does not look back with feelings which he would in vain attempt to describe, to the delightful rambles which his native fields and meadows afforded to his earliest years? Flowers are among the first objects that forcibly attract the attention of young children, becoming to them the source of gratifications which are among the purest of which our nature is capable, and of which even the indistinct recollection imparts often a fleeting pleasure to the most cheerless moments of after-life.—*Kidd*.

WHEN two friends part, they should lock up one another's secrets, and interchange their keys.

THE noblest weapon wherewith man can conquer, is love and gentlest courtesy.

N.B.—The Second Volume of this Periodical is now ready; covers for binding, with table of contents, may be ordered of any Book-sellers.

[UNSTAMPED, 1^d.
STAMPED, 2^d.]

King Lear and his
Daughters.

KING LEAR AND HIS DAUGHTERS.

Lear. Now, our joy,
Although the last, not least; to whose young love
The vines of France, and milk of Burgundy,
Strive to be interest'd; what can you say, to draw
A third more opulent than your sisters? Speak.

Cordelia. Nothing, my lord.

Lear. Nothing?

Cor. Nothing.

Lear. Nothing can come of nothing: speak again.

Cor. Unhappy that I am, I cannot hear
My heart into my mouth: I love your Majesty
According to my bond: nor more, nor less.

Lear. How, how, Cordelia? Mend your speech a little,
Least it may mar your fortunes.

Cor. Good, my lord,

You have begot me, bred me, lov'd me: I
Return those d. ties back as are right fit,
Ohey you, love you, and must honour you

Why have my sisters husbands, if they say,
They love you all? Haply when I shall wed,
That lord, whose hand must take my plight, shall carry
Half my love with him, half my care and duty.
Sure I shall never marry like my sisters,
To love my father all.

Lear. But goes this with thy heart?

Cor. Ay, good, my lord.

Lear. So young, and so untender?

Cor. So young, my lord, and true.

Lear. Let it be so;—thy truth then be thy dower:

For,—

Here I disclaim all my paternal care,
Propinquity, and property of blood;
And as a stranger to my heart and me,
Hold thee from this for ever.

Shakspeare.—King Lear.

FARLEIGH GRANGE.

So utter is its desolation that even winter lacks the power to make its aspect wilder or more desolate. Summer leaves, and summer flowers, bright with the sunshine or glittering with the dew, trailing along the broken walls and shattered coping-stones, hanging a garland over porches moulder into dust, over dim discoloured window panes, over wormed and mossy garden seats, over fountains choked with weeds, over paths but barely pervious, mock and magnify its desolation and decay; but in winter all external and surrounding objects are in keeping with the void and ruined Grange. Titanic trees circling the old house like a body-guard of giants, wierd and awful in their look as those which frowned upon the Pilgrim's path, naked and gnarled, and making melancholy music as the wind sighs through the leafless boughs; bare slopes, with here and there a barer hush creaking as it sways; here and there a heap of faded leaves, that rustle with a startling unfamiliar rustle as you tread; dead stems of flowers, and crackling sapless shrubs, weaving a tangled network that overspreads the uneven terrace and dismantled urns; the stagnant and turbid fishpool, the very clouds themselves, heavy and cold and leaden, and creeping sluggishly across the sky; are perfectly in harmony with all the eye discerns and all the imagination pictures of that old decaying house.

Did light laughter ever echo underneath that roof? Did youthful footsteps ever bound along its floors? Did the firelight ever gleam in crimson flakes upon its shining walls? Were rosy children ever awakened by the summer sunshine streaming through its cheerful window-panes? Did the smoke of blazing yule logs ascend its tunnelled chimney stacks at bygone Christmas festivals? Who were its inmates? what was their history? Why is it tenantless—fallen to decay?

Pass through the vaulted porch, traverse the sounding hall, and by the cold deserted hearth sit down, and let us conjure up a history of the past.

Once on a time,—for that is, after all, your only legitimate method of opening a tale,—once on a time, two centuries since perhaps, a grey-haired man, who had amassed great wealth by trading ventures to the East, came hither to reside. An only daughter, her husband, and their child, shared in the old man's heart and home. He had been a poor dependent, this son-in-law, whose thrifty zeal had helped to build the fabric of the merchant's fortune, and, growing in his good opinion year by year, gained at the last the rich requital of his daughter's hand. Her hand, we say, for that her heart accompanied it admits of doubt. If rumour did

not wrong him, this son-in-law was one better calculated to excite distrust and dread than love. Fair seeming, smooth spoken, humble almost to abjectness, winding into men's thoughts without developing his own, with a wandering eye, a hesitating step, thin bloodless lips wearing a perpetual smile, a smile so like a sneer that it was difficult to determine when he smiled and when he sneered,—he was a man whom dogs and children would instinctively avoid: direr reproach we will not stay to cast upon him. Those wandering eyes of his, how truly did they symbolize the narrow restless mind which worked within! how intelligibly they spoke of growing, greedy, unsatisfied desires, of baneful, peace-destroying passions usurping absolute dominion over that inquiet stormy mind! The inactive aimless life he led, subserved to foster those desires by offering no diversion to the current of his thoughts, which still flowed on in one direct and unimpeded course, delving a deeper channel, expanding into a broader flood, and gaining might, and volume, and velocity, by the mere absence of all impediment and check.

He knew that, come what might, all that his benefactor had amassed must one day devolve on him; but then the certainty was not so proximate as he could wish. Years might elapse before the wealth so coveted should become his portion. Oh, that the inevitable, but yet remote, event could be accelerated! Oh, that the wearisome delay, the tedious waiting for the dead man's shoes, could be abridged! And might it not? Ay, might it not? In this one question all his gloomy reveries eventuated: beyond it, all was dim, chaotic, undefined.

So, brooding over this dark thought; so, day by day, tending and nourishing the poison-plant which had struck deep root and thrived apace within his mind, until its baneful growth became too mighty for repression; so, suffering suggestion to assume the form and pressure of a settled purpose, and listening to the whispers of a dwarfish fiend, until that fiend, dilating with his expanding influence, swelled into giant's shape, and wore the mien and gestures of a stern inexorable taskmaster; the old man's son-in-law became the docile slave of Avarice. Day and night, weekday and holiday, at mass and meals, visions of wealth, of sole supreme possession, flitted before his eyes, and ministered unceasing aliment to the master passion of his mind. But ever there arose one uniform impediment,—ever the figure of an old grey-headed man glided between him and his desire; and ever, as that presence troubled him, a phantom whispered in his ear suggestions of a fearful import, which, awful and hideous at first, grew less and less repulsive with every repetition, so that a murderous thought at length would lose its horrid

character, and harbour in his brain as naturally as though it were its own familiar lurking-place. From thought to act, from the motive to the method, were easy, if not inevitable, transitions. And yet, and yet, there was a haunting dread, the disquieting and constant fear of subsequent detection, to deter him from the deed. "Silently and well would poison work, but if suspicion should arise—" and then the prospective murderer would ponder on the matter more profoundly, search into old treatises, study the nature of mineral and vegetable poisons, and test their effects on animals, whenever practicable, until his knowledge of their character and operation was accurate and complete.

And one was chosen, slow, and subtle, and sure as truth itself; and nightly mingled and administered in the stoup of spiced wine which custom had commended to the old man's palate. Yea, while he drank, the placid murderer stood by and never blanched; heard kindly words, thankful acknowledgments of his (the murderer's) delicate attentions fall from the old man's lips, and yet felt no compunctious visitings! And every day he saw the fitful flame of life which burnt within the victim's frame flickering with a fainter, feebler light, and knew how soon it would be quenched for ever; and saw the earnest sorrow of the daughter of that dying man, and yet persisted in the desperate crime, unwavering to the last! Grey-headed old man, surrounded on thy death-bed by delusions, close thy dim eyes in peace, happy in the illusory belief that thou hast confided thy daughter's happiness to safe and worthy keeping! He sank so slowly, wasting away with such a gradual decline, so like the natural decay of life, that, when death *did* set his "silent seal" upon the suffering clay, no comments followed the event, and he was laid to sleep within the village church with solemn pomp and simulated grief by the husband of his child, the inheritor of his possessions, and the destroyer of his life.

"To sleep," said we? No, not to sleep, but thenceforth to haunt the troubled vision of the assassin by his perpetual presence. Go where he would, to the murderer's fancy the very air was full of eyes, dim aged eyes, glaring upon him with a fearful menace. Through the dim gloom of midnight the angry gleam of those old eyes would seem to penetrate and awe him. In the blazing embers, in the pictures on the walls, in the fantastic figures on the fountain, in the white clouds that skimmed athwart the sky, in the very stones upon his path, he saw the lineaments of the murdered man. In the moaning of the wind, in the shivering rustle of the leaves, in the murmuring ripple of the water, in every casual, transient, sound, there were, to his ear, intelligible articulations of the old man's voice. Wine had no power to banish from his brain the frightful images which thronged in thick succession through it; there was a poisonous savour in everything which met his lips; and the pure element itself smacked of a polluting mixture. Music was torture to his ears, for his wife found melancholy solace in dwelling on the songs and melodies which her father in his life-time loved; and by the mere force of association the murderer would shudder as he passed *one* vacant chair, and hurry from the room, filled with the fear of seeing its former occupant glide into his accustomed seat.

His wife, too, pined and drooped, and seemed to wither gradually away. As we have hinted, her affection for the only parent she had ever known, had never been supplanted by the more impassioned love which ordinarily springs up within a woman's heart towards him with whom she forms a new and nearer tie. From a sentiment of duty towards her father, rather than of actual attachment to the object of her father's choice, she had originally consented to the union proposed to her; and in the society of that father, and in the nurture of her infant son, she had subsequently found her greatest happiness; hence the bereavement she had sustained was full of bitterness. The one golden link in the chain of old remembrance was snapped—the living

memento of earlier and happier times was now no more. That wrinkled face, those silvery hairs, those old benignant eyes, that kindly voice—lost, lost—irretrievably lost. While he was alive, it was a joy only to meet his affectionate greeting, morning and evening—much more to hold *his* converse of the past, to run over the sunny retrospect of her girlhood, to compare impressions, restore the half effaced, and, by renewing, vivify the fresh. Dreary, exceeding dreary, therefore, was the void created by the death of that dear doting parent.

Her spirits sank, and then her health, and then she, too, went down into the dust. Her husband and her son, the one a haggard, prematurely grey, and conscience-stricken man, the other a dull-eyed, glibbering idiot, abandoned Farleigh Grange within a year of her decease, and perished by shipwreck on their voyage to a foreign land. The estate reverted to a distant relative, but, often as it has been tenanted, the Grange has never been the permanent abiding place of its inhabitants. Some curse appears annexed to its possession—some fatality attached to its possessors; and, for half a century past, it has been, as it now is, a desolate, deserted, and, in common credence, haunted house.

SCENERY OF THE GREAT WESTERN RAILWAY.

Few chapters in the history of civilization and human industry are so replete with importance and interest to every grade of readers, as the accounts of the means by which England has been, within the last score of years, covered with a net-work of iron, or System of Railways. As a branch of national economy, the subject will have a paramount claim upon the attention of the statist and the politician in forming their estimates of the means by which the internal prosperity and domestic peace of the empire have attained a century of advancement within less than a quarter of that period. At this vast subject it is but our intention to glance; and rather to select one of its stupendous examples, and describe its course and construction, we trust, so as to prove that a Railway, instead of cutting up and despoiling the face of the country, has, like a fertilizing river, enriched and embellished the district through which it trends, in its progress stretching out its giant arms of improvement on each side of its mighty course.

For this purpose we have preferred *THE GREAT WESTERN RAILWAY*, in many respects the most important work of its class yet completed; and one of the most attractive by means of the picturesque and interesting country through which it passes. There exists, likewise, a peculiar facility for our task, or rather labour of love, in a work of the highest authority, which has just been issued from the press. This is a magnificent folio volume, detailing the history and description of the line, profusely illustrated with views of its great works, and the adjacent scenery; and forming, altogether, the most complete specimen of Railway Illustration yet produced. The work is, in every respect, worthy of the noble subject: the scenic pages are masterpieces of the artists' skill, both draftsman and lithographer; and the literature of the volume, both as regards scientific treatment and descriptive talent, takes precedence of every labour of its kind. In its vivid details of the skill of our own times in Railway construction, and of the glories of other ages in the antiquities of the country

(1) *The History and Description of the Great Western Railway, including its Geology, and the Antiquities of the District through which it passes: accompanied by a Plan and Section of the Railway, a Geological Map, and by numerous Views of the principal Viaducts, Bridges, Tunnels, Stations, and of the Scenery and Antiquities in its Vicinity: from Drawings taken expressly for this Work, and executed in Lithography, by John C. Bourne. Folio. (Size, 16 by 14 inches.) D. Bogue, Fleet-street. 1846.*

through which the line passes, this work presents a truly glorious picture of present and past. It has been published, we are informed, at an outlay of some fifteen hundred pounds, a large sum, if it is true; but only proportionate to the vast and varied interest and attraction of the subject of the work, and its demand on popular encouragement. By the aid of this very complete work we shall proceed to describe that truly magnificent line—the Great Western Railway.

"Bristol, the capital city of the West of England, has been distinguished for its commerce from a very early period, and was for many centuries the second city in the British dominions. Its position, upon a tide river, and surrounded by an extensive coal-field, appears as well fitted to secure a pre-eminence amongst the manufacturing interests of modern times as amongst those of commerce in days of yore. In practice, however, this has not been fulfilled. The manufacturers of England, since they have attained their present immense importance, have flourished chiefly in the Northern and Midland districts, and have not descended, in any great force, into the West."

It was natural to expect that the Railway System would be introduced at an earlier period amongst a population enriched by machinery, such as that lying northward of Birmingham, than amongst the men of commerce and agriculture who inhabit the West. Thus, the Liverpool and Manchester Railway was completed before any of the passenger-railways about Bristol were commenced; and the Great Junction and London and Birmingham Railways both obtained their Acts earlier than the Great Western Railway; though, when the latter was brought forward, it received a far more cordial support from the population of its own districts than was the case with the northern lines.

Thirteen years have now elapsed since the Great Western Line was first proposed; mainly with the object of reviving the commerce of the ancient port of Bristol, in connecting it by this iron road with the Metropolis. The enterprise was a noble one, and reminds one of the recovery of its fortunes by Cabot, some three centuries and a half since.

The Railway project was warmly taken up; for we find Mr. Britton leaving his antiquarian pursuits to illustrate its advantages, in a Lecture read before the Literary and Philosophical Society of Bristol, Oct. 19, 1833. "London," says the Report, "from its greatness, is, and must long continue to be, the centre of wealth, of arts, and of commerce; but its port is not well situated for the trade of the West: a long and dangerous passage, during the winter season, of more than one hundred leagues, must be made by ships coming from the West. Could vessels discharge their cargo in this port, they would be in safety, and ready for another voyage; indeed, ships from America and the West Indies, under favourable circumstances, may make two voyages in the season; but the fortnight that it takes longer in going to London is often fatal to their doing so. This will show the advantage of a ready land communication with London, which is now afforded by the projected Western Railroad. By this, the cargo of a vessel discharged in Bristol, may, in six hours, be in the centre of London, and conveyed at a moderate price at all seasons of the year. Bristol may become, under these views, the Great Western Port of London, being but six hours' distance from her. It has been figuratively said that the Grand Junction Canal may be compared to the back-bone of England. Then, surely, we do not violate propriety by saying that the Great Western Railway may be the right arm of the Metropolis." This anticipation was not a mere rhetorical flourish; but, as we have just said, the promise has not been fulfilled. There were many difficulties at the outset: the advantages were, by no means, generally appreciated; the estimated capital,—two and a half millions,—was large; and the line was to be carried through a district altogether unused to such undertakings, and pre-occupied by powerful turn-

pike-road and canal interests. It is not to our purpose to enumerate the several Acts of Parliament obtained for forming this Railway; but it should be mentioned, that, in the early stage of the proceedings, the promoters of the measure did not consider it practicable to apply to Parliament at once for an Act for the whole line. It was, likewise, at first intended to connect the line with the London and Birmingham Railway at Kensall Green, about four miles from the Metropolis; but the idea of this junction was abandoned, and a separate entrance into London secured.

Before we proceed to details, it may be as well to notice certain circumstances in which the Great Western district differs from any other. Its traffic is altogether of a higher class than that in the North: for example, the existence of such a city as Bath, or such a town as Cheltenham, (to which latter the line has been extended,) supported entirely by persons living upon their incomes, is peculiar to the West; and the passengers, if not so numerous, yet indulge in higher comforts than the general population of such towns as Birmingham or Manchester. The line of country westward of London, also, differs from every other line in the number and character of the towns upon the route. "Of a train-load of passengers starting from London, a considerable number, and of the highest class, might be expected to leave the Railway at Windsor, at Reading, at Oxford, at Gloucester, at Cheltenham, or at Bath; comparatively few of the original passengers will leave at Bristol; whilst, on the other hand, the seats of many of those who had left the train would be filled by persons proceeding to Bristol from the place for which the others had departed. This is wholly different from what takes place either upon the Birmingham, or upon any other line of Railway proceeding out of London; and the towns that have been named are, notoriously, centres of a numerous and wealthy population."

In choosing the course of the Railway, two lines of country were to be considered, between London and Bristol, or rather, between Reading and Bath; the one ascending the vale of the Kennet, keeping the high ground south of the Marlborough downs, and descending through the Cotteswold by the valley of the Avon; the other following the ravine of the Thames, from Reading to near Wallingford, ascending the great vale of Berks, at the foot, and to the north of the Marlborough downs; and therefore intersecting the crest of the Cotteswold, above Box, a village a few miles east of Bath.

Mr. Brunel, the appointed engineer to the Company, chose the latter line—to the north of the Marlborough downs—both as being, in an engineering point of view, the best line, and as affording, in a greater degree than any other, facilities of communication with Oxford, Gloucester, Cheltenham, South Wales, and the West of England generally; points of very great importance.

The line, accordingly, takes the following direction through the counties of Middlesex, Bucks, Berks, Wilts, and Somerset. It commences at Paddington, passes by Acton, Ealing, Hanwell, over the Brent, to near the cattle-market at Southall, within two miles of Uxbridge; through Slough, and within one mile and three-quarters of Eton and Windsor; through Salt-hill to Maidenhead, where it crosses the Thames, and within six miles of Marlow; and thence passes within five of Wokingham and Henley, to Reading. The line next takes rather a northerly direction, ascending along the right bank of the Thames, which it crosses and recrosses at Basildon and Moulsoford, where it is four miles from Wallingford; and thence passes to Staunton, where it is four miles from Abingdon, and ten from Oxford. Its course then proceeds westward, within two miles and a half of Wantage, six miles of Faringdon, four of Highworth, and one and a half of Swindon, whence there is a ready communication with Marlborough, Hungerford, and the south of Berkshire, and where the line is joined by the Cheltenham and Great Western Union Railway, now complete to Cirencester, and between Cheltenham

and Gloucester; the latter city being the intermediate point for future Railway communication between South Wales and the Metropolis. From the Swindon Station, taking a south-westerly course, the line passes within half a mile of Wootton-Basset, six miles of Malmesbury, and six of Calne, through Chippenham, within five miles of Melksham, and nine of Devizes, through the southern suburb of Bath, where it crosses the Avon, to Bristol. Here it passes close to the dépôt of the Coalpit-heath Railway, which brings down the coal of the Gloucestershire collieries, and will, when completed, form the line of railway communication between Bristol and Gloucester. The communication westward and south, from Bristol, is continued by the Bristol and Exeter Railway, now open through Bridgewater to Taunton, and in course of construction to Exeter. This line affords an easy access to Weston and the watering-places on the Severn; and Exmouth, Dawlish, Teignmouth, Torquay, and the other places of resort in the south of Devon lie at no great distance from its extremity.

The Railway traverses a great variety of geological formations, and terminates in the centre of a district of high geological interest. As the arrangement of the strata is on the whole uniform, the upper and newer formations being found at the eastern end, and the older cropping out or rising to the surface in regular geological succession as they approach the West, there is little difficulty in arranging the order of their description: still, we are compelled, by want of space, to omit it, and summarily state that the formations intersected by the Railway extend from the London clay down to the coal-measures of the Bristol basin; and within a distance of thirty miles from that city, upon the railways that branch from it, are found all varieties of rocks, from chalk, to grauwacke and trap. It would be difficult to select a line or district possessing greater geological interest, and better fitted for the convenient study of the science itself. Accordingly, the chapter devoted to the "Geology" of the line, in the great work before us, is one of its most important sections.

Having thus briefly described the general and geological features of the country traversed by the Railway, we shall next bestow a short notice upon its main points of construction; and, first, of the gradients.

The greater part of the rise upon this line is concentrated within a comparatively short space by means of two inclined planes, upon one of which assistant power is employed, and the remainder of the line thus left free to be more economically worked. There is but one summit level, which is 77 miles from the London end; and, consequently, within about 18 miles only from the centre of the whole line. This summit is 270 feet above the London dépôt, and 292 above that at Bristol. From London the railway rises gradually to Maidenhead, Reading, and the Oxford Station at Steventon, by easy gradients, nowhere exceeding four feet in the mile, or one in 1,320, and frequently under this. This is a distance of 56 miles, and upon it occurs the heaviest traffic. From Steventon to the Swindon summit, the line continues to rise gradually, without undulations, at a maximum inclination of eight feet in the mile, or one in 600. From the summit level, the line descends by two inclined planes at Wootton-Basset and Box. The intermediate gradients do not exceed eight feet in the mile; the inclinations of the two planes are one in a hundred, or 52 feet in the mile. The length of the Wootton-Basset plane is one mile and 550 yards; it is surmounted without any extraordinary assistance. The Box plane is two miles and 660 yards in length, and upon it occurs the Box tunnel, the first out of London. Upon this plane an assistant engine is employed. From Bath to Bristol, the descent is one continued gradient of four feet in the mile, or one in 1320. Thus, the whole line, (118 miles 20 chains in length,) with the exception of the inclined planes, may be regarded practically as level; and it has been so arranged that four-fifths of the traffic are carried

on upon that part of the Railway of which the maximum gradient does not exceed four feet in the mile.

From the latter advantage, the absence of objectionable curves, and the great proportion of passenger traffic expected upon the Great Western Railway, it was proposed at a very early period of the undertaking to travel at a higher speed than had been attained upon other Railways. With a view to this end, the permanent way was peculiarly laid—principally in fixing the gauge or distance between the rails at seven feet, a much greater width than had hitherto been adopted, and by which it was proposed to ensure greater steadiness than was otherwise consistent with high speed.

The rails upon the Great Western are what is called bridge-shaped, with wide wings, or flanges; they are laid upon continuous bearings of wood, instead of upon the interrupted support of chairs or pedestals, as usually employed in this country; and it was proposed by this means to obtain greater steadiness of motion, with less noise, and less of that wear and tear which forms a very serious objection to high speeds upon ordinary Railways. The longitudinal bearings are half timbers of American yellow pine, connected together by transverse timbers. The whole frame is simply laid upon the road, which is previously covered with a bed of broken stone, burnt clay, or gravel, called technically "ballast." The main timbers are themselves canted or inclined inwards, at a slope of one in twenty; and the rail, of sixty pounds weight to the yard in length, are screwed down upon a strip of felt. The rails are almost wholly of Welsh iron, rolled at the several works of Howlais, Ebbw-Vale, and Rhynny.

Such are the main constructive peculiarities of the "Great" Western Railway; by the magnitude and importance of its engineering works, entitled to the character of "Magnificent." We now proceed to notice, in the order in which they occur, the principal objects on the line, and the picturesque country through which it passes.

Starting from the Paddington Station, there is little to notice: the present arrangements are temporary only; a large plot of ground being set aside for the purposes of a permanent station. Nevertheless, we are struck with the vast space covered by the engine and carriage sheds and workshops. We are struck, too, with the colossal size of the engines. The carriages, also, are of excellent build and accommodation, and some of them cost 400*l.* each. Some are eighteen feet long and eight feet wide, while others are twenty-one feet in length. Here, too, is kept the royal state carriage, fitted up for the accommodation of Her Majesty and Prince Albert. It is twenty-one feet in length, and nine feet in width, and the interior is divided into three compartments; the centre forming a saloon, twelve feet long, and six and a-half high, and fitted up with crimson and white silk, panelled with gilt mouldings in the style of Louis Quatorze; and embellished with allegories of the four elements, painted by Parria. The furniture is of richly carved oak; and the upper part of each end of the carriage is fitted with plate-glass, affording an uninterrupted view of the railway line. We have spoken of the vastness of the engines: one of them, "the Great Western," has driving-wheels eight feet in diameter, eighteen-inch cylinders, and two-feet stroke; and, in a trial made in June last, this engine drew a train one hundred tons weight, at the rate of from sixty-five to seventy miles an hour; yet, with this extraordinary speed, the passengers had no feeling of uneasiness.

The Paddington dépôt is crossed by three large bridges, or viaducts, carrying roads between various parts of the adjacent property, upon which a new town is now building, under long leases from the Sec of London. The large size and embellished character of the mansions, in a moment, impress the beholder with the gigantic spread of luxurious London, and its thousand-fold piles of patrician dwellings, more observable in this western suburb than in any other direction. Yet the eye soon leaves this palace-building grandeur, and returns to the Railway, which quits Paddington in cutting. On the

right, however, is seen the Kensal Green Cemetery, with its glittering temple, and its classic monumental memorials—the emblems of the sleep of death, strangely contrasting with the turmoil of the Railway progress, which can scarcely indicate the rapidity of life. We have often lingered in this Cemetery—this vast and daily increasing assemblage of costly temple and column, mingled with foliage of funereal hue—and there reflected how the Great Town is daily contributing its dead to this city of tombs.

Opposite the Cemetery, we gain an occasional view of the vale of the Thames, over Wandsworth and Richmond, with the wood of Holland House in the foreground, and the Surrey chalk-hills in the extreme distance. The line here crosses the course of the abandoned works of the Thames Junction Railway, at about only a quarter of a mile from the London and Birmingham Railway; and from the top of the embankment, at Old Oak Common, there is a pleasant view of a tract of country, well studded with villas and other indications of opulence. The part of the line east of Acton, including the depot and terminus, forms “the Paddington extension,” or that portion of the line formed after the plan was relinquished of entering London by the Birmingham Railway from Kensal Green. Yet, by making private arrangements with the landowners, the works were commenced long before the Act for the extension was obtained; so that, by severe engineering exertions, this part of the line was completed at the same time with the portion between Acton and Maidenhead, which had been commenced under the original Act, nearly a year previously.

We soon reach the Ealing Station, five miles and a half from London, though from the line lying in cutting, we lose the picturesqueness of Ealing Common. We are now close on the northern side of the Uxbridge Road, once a noted pleasure drive out of the Metropolis, but now an almost deserted and silent highway. The village of Ealing lies leftward of the road; the church fell down in 1729, and was rebuilt in 1736, “apparently after designs by the churchwardens,” for it is a heavy, tasteless, brick pile. Further on the Uxbridge Road are the Old Hats taverns mentioned by Bickerstaff, in his play of the “Hypocrite.” On the opposite side of the Railway, the station opens upon the road from Ealing to Twyford, and the high ground of Castle-bar, where the Duke of Kent, the father of her present Majesty, possessed a well-appointed mansion; though only a lodge and entrance-gate remain.

The Railway soon enters Hanwell, upon a gravel embankment; and the Hanwell Station, seven and a quarter miles from London, stands upon the northern side of the line, upon a short viaduct; from whence a second embankment leads to the Wharncliffe viaduct, the largest piece of brick work upon the railway, and about the first work completed. It is, indeed, a gigantic structure, consisting of eight elliptical arches, each seventy feet span, and seventeen feet six inches rise; the piers are composed each of two square massive pillars of brick, slightly pyramidal, and of somewhat Egyptian character. The base of each pier stands upon an area of 252 feet, the total length of the viaduct is 900 feet; the breadth between the parapets thirty feet. It is named “the Wharncliffe Viaduct,” in acknowledgment of the services rendered by the late Lord Wharncliffe to the Great Western Railway Company, as Chairman of the Lords’ Committee upon their bill, and its principal supporter in the Upper House. Upon the south face of the parapet are set up the Wharncliffe arms, sculptured in stone. The view from the Railway here is very striking; the new church of Hanwell, in the early English style, and

“That neighbouring hill, where
Harrow stands so high,”

are the principal objects on the north;

“Perivale, pranked up with
Wreaths of wheat,”

and Greenford, are still, as when sung by Drayton, to be seen upon the banks of

“Brent, that pretty brook;”

“and the churches of these villages are bits of not unpicturesque antiquity.” On the the south side of the railway, the Lunatic Asylum for the County of Middlesex occupies the foreground, and, rarely fails to give rise to commingled feelings of pain and consolation in the spectator; in showing a dire necessity to be met by the mildest means that humanity can dictate.

The Hanwell Asylum, however, merits an independent note, it being one of the noblest instances of wisdom-tempered zeal and humane skill which our age can boast of. The building and its appurtenances occupy upwards of fifty-three acres; the several patients, sometimes nearly a thousand in number, are treated according to the intensity of their affliction; but in no case is unnecessary restraint practised. Working upon the proverbial association of idleness and vice, in all cases where practicable, employment is resorted to as a remedy; and nearly all the operations of this vast establishment are conducted with the utmost order by lunatics; shops of lunatic tailors and shoemakers may be seen here at work; and the bakery, the laundry, and other domestic offices, are worked by the same “patient” classes. The out-door arrangements are upon the same system of non-restraint. The gardens and shrubberies are neatly kept by the inmates, who are allowed to enjoy their health-giving air with the most indirect surveillance, and various pastimes are allowed to minister to the “mind diseased.” Within doors, reading of an interesting and attractive, though not exciting, character, is provided; the tables are strown with cheap periodicals, in the hope that their good seed may not invariably fall upon the mind, as it were, lying fallow. Here, as in the same world outside of the Hanwell domain, society has its pets and butts, and men are prone to sport with each other’s weaknesses; but this is no new phase of humanity. We, who remember but too distinctly the clanking fetters and the horrifying gaze of the inmates of the old Bethlehem, have inspected Hanwell with very different feelings; and, as we walked, almost unattended, through crowds of “lunatics,” were indeed gratified to find them so far sane as to be sensible of their humane treatment. From the wall of one of their dormitories we copied the following lines:—

“Behold!

No gloomy cells where sullen madness pines
In chains and woe, where no glad sunlight shines;
But here kind sympathy for fallen reason reigns;
Our rule is gentleness, not force or galling chains.”

On the south side of the garden lies the burial-ground, wherein all patients not removed by their friends or parishes are buried; and here sleeps the individual who planned the Asylum, and eventually became one of its inmates for a long period previous to his death—one of those extraordinary coincidences that belong to the category of popular fatalism.

We have wandered from the Railway, but, we trust, not unprofitably, if this note have the effect of drawing attention to the frightful increase of insanity in this country, and to the best means that can be devised for its remedy and prevention. In the valley wherein lies this “happy port and haven” for afflicted nature, is a scene of serenity which should calm the angry passions that too often chase men out of the world of reason. The stream of the Brent passes through a brick channel beneath the second eastern arch; and the absence of its waters is compensated by the slopes and undulations, the graceful trees, and the foliage that thickly clothes portions of the embankment. The vastness and Egyptian design of the viaduct, perchance, remind us of the lasting grandeur of some of man’s labours; yet, look through one of the archways at the distant church, and the memorials of mortality with which it is surrounded, and what a lesson—what a shock—does human pride

receive in the contemplation ! Turn again to the scene of pastoral beauty, and smiling nature, in the verdant valley, and what joy unspeakable is to be found there !

The Wharfedale viaduct, we should mention, was built by Messrs. Grissell and Peto, who were also the contractors for various portions of the railway between London and Basildon. At about a quarter of a mile west of the viaduct, the Railway passes over, and obliquely, to two roads by an iron bridge and massive columns cast in Yorkshire. We soon reach the hamlet of Southall, nine miles from London, at which distance there is a station, with accommodation for loading and unloading cattle ; the celebrated cattle-market being held in the hamlet. In the south lies the well-wooded domain of Osterley, the seat of the Earl of Jersey. The Railway passes through Southall Park, and near the mansion, a spacious brick structure, belonging to the Jersey family, but now used as a private lunatic asylum. Between Osterley and the Railway may be noticed Norwood church, which retains some features of the early English and decorated styles. At Bull's bridge, within a quarter of a mile, the Railway crosses the Paddington Canal, the Yedding Brook, and the Grand Junction Canal, in its way to join the Thames at Brentford.

We soon reach the West Drayton Station (for Uxbridge, Colnbrook, and Staines,) thirteen miles from London, and standing on the brink of the brick district, upon the eastern edge of a broad, shallow valley, along which meander the streams of "the crystal Coln." West Drayton church, on the south of the line, is a very perfect example of the perpendicular style ; and outside the churchyard is a brick gateway of later date, but worth examination. Here the Railway crosses "the County Ditch," and leaving Middlesex, enters Buckinghamshire. This valley appears also to divide the London from the plastic clay formation, though from thence to Slough the latter is covered up with marl and gravel beds. The dead flat of the view is now relieved by glimpses of Windsor Castle, Eton College, and St. Leonard's heights. There is little else to attract until we reach Slough, if we except the church of Langley Marsh, or St. Mary's, on the south, which is an architectural study, with its examples of the Pointed Norman, early Decorated, and Tudor styles.

(To be continued.)

BLACK FRITZ.

CHAP. II.

THEY had now reached the valley ; the house lay before them, and the inhabitants soon appeared, and interested themselves in preparing the carriage ; and in putting everything in operation that was necessary for its repair. It seemed that the stranger had the entire command here, and, as Luitgarde drew near, while he was not present, to one of the workmen, she saw for the first time that they were men of immense, even terrific, stature. It was not without unwillingness that she spoke to one of them, and asked about the gentleman—their master. He was a merchant from Budweis, she was told, and the house and the implements here were his. At these words Luitgarde became more tranquil. "These dark savage looking men were workers in iron, and it was a great satisfaction to Luitgarde to see how ably they set about their business, so that she could soon hope to continue her journey. But the stranger was still absent ; at length he appeared with a troubled expression on his countenance. He asked her pardon for having made her wait so long, begged her respectfully to come into the house, and then opened a handsome room on the ground floor ; a small collation lay ready on the table, and an old woman received her with many reverences. The stranger's manner of giving her a chair, of offering to her fruit and preserves,

attracted her attention, and indicated a more elevated station of life ; a melancholy expression in those strongly marked features, joined to a soft tone of voice, excited in her heart the strangest feeling.

Her attendants now came to tell her that all was ready, and the carriage in a state fit to continue the journey. The stranger rose from his seat, and cast a terrific glance on the entering domestic, who brought this unwelcome message to his mistress. Luitgarde at the same time showed symptoms of fear ; the stranger noticed it, and again in a mild tone asked her pardon for the suddenness of his movement, and offered her his arm in order to conduct her to the carriage. She bowed assent in a kind manner, and placed her hand on his arm. He suddenly stopped, looked at her for some moments, and said, after a struggle with himself, "Noble lady, permit me to have the honour of saying a few words to you alone."

Luitgarde made a sign to her maid to leave the room, who left it accordingly.

"You have spoken to me of Black Fritz ; you do not indeed fear him, but his hand ; he has reason to avoid me ; where I am, he certainly does not come ; so permit me to present to you this ring, and if, by any unlucky chance, you fall into his or his people's hands, show this ring and you are safe."

Luitgarde stood quite amazed ; a thought which like lightning shot through her soul, overwhelmed her ; the swarthy stranger of the banks of the Moldau appeared before her mind ; she fancied she found a resemblance between him and the Budweis merchant ; she was seized with a shuddering, and, without being able to speak, and without taking the ring which he held out to her, she looked at him with a scrutinizing and frightened air. But the nobleness of those features, the mild expression of those eyes, checked her childish fears—she recovered herself and took the ring. It was a handsome cornelian, richly set in gold, and on both sides ornamented with three small diamonds in the form of a trefoil.

"I thank you from my heart, and I know the entire extent of my obligation towards you ; this ring will I preserve as a precious bijou, and I shall return it with the most lively thanks to its owner when I no longer require it : but now be so obliging as to tell me your name and habitation, that I may—"

"Does the poor present of an uncouth stranger overwhelm you ?" asked the man, with evident emotion ; "the ring is very dear to me ; I give it to you ; it shall serve you, perhaps save you, therefore must remain with you, and you—"

A blush diffused itself over the whole of Luitgarde's face, and she instantly let the ring fall into her bosom, without thinking what she was doing, for some one at the moment entered the room.

The merchant again offered his arm ; they left the room, he assisted her into the carriage, a slight pressure which he permitted himself of her hand, was even slightly acknowledged—their eyes met each other's once more, and the horses hastened off with the carriage.

In deep reflection, and with contending feelings, did Luitgarde proceed ; she could not deny that the appearance of the Budweis merchant had made a powerful impression on her as no man had yet done, and the incomprehensibility of the matter was the force by which his mind had acted on hers, obliging her as it were to unreservedness and kind feeling towards him, whom she had never seen, indeed whose exterior and "entourage" seemed to comprise many singular, and not agreeable mysteries.

Arrived at her uncle's castle—the latter came to meet her full of joy, and with the news that his son was expected in the evening. Luitgarde had accidentally heard that, and yet this news fell on her like a thunderbolt. She was not in a state to answer ; the fatigue, the commotion of the journey, the accident—which her maid had related in all its circumstances—served her as a pretext

to withdraw to her chamber. Here she threw herself on a chair: a storm rose in her breast; a thousand thoughts, images and feelings, sorrow and shame, curiosity and inquietude, terror and love, opposition and chagrin, moved in chaotic contention with each other; she was discontented with herself, with Frederick's sudden arrival, with the importunate attentions of the stranger, with the whole world. Then a noise was heard in the castle—doors were opened and shut—rapid steps were heard in the passages. Frederick was come: she was now forced to collect herself and meet him in a suitable manner. She rose from her chair, she felt that she trembled, and her knees tottered under her. "Heavens! what is this!" cried she, "what is the matter with me?" In this agitated state, as she raised her hands, the stranger's ring fell from the folds of her neck handkerchief; she was alarmed as if at the appearance of a spirit; but some one was approaching her chamber, she rapidly seized the ring, looked on it once more, and then concealed it in its former place. The door of the antechamber was opened; she heard her uncle and a second male voice, which strangely affected her. She rose up, however, with resolution, and hastened to meet them. Her uncle stood before her; and a younger man, in whose developed features she recognised the contours of her youthful friend, saluted her with grace and respect. "This is my son, my Frederick—*thy* Frederick," said the count joyfully, "and this is thy future bride."

"My fair bride!" gently whispered Frederick, while he stretched out his arms to embrace her; but in her the interior storm had reached its highest point, an indescribable sorrow agitated her breast, a deep cry escaped her, and she sank powerless on Frederick's shoulder.

On recovering she found herself on her bed; her uncle held her in his arms, Frederick was on his knees before her and holding her hand—and her maid was employing essences and restoratives. She looked wildly round; all seemed as a dream; and now a stream of tears broke from her eyes, and freed the oppressed heart.

"How are you, dear cousin?" asked Frederick. "Ah! heavens, you weep!"

"Had I thought that you would have been so much affected, I should have prepared you," said the old count; "but who could have believed—"

Luitgarde endeavoured to contain herself. "Do not be uneasy, my dear uncle; and you, Frederick, forgive me! I had no power over myself, but now it is past, I am again easier." She stood up, and strove to look in a friendly manner on her cousin, and to speak to him of his journey and residence at Vienna. It cost her unspeakable pain, but she succeeded. Frederick began his narrative, his father listened with inward satisfaction, and Luitgarde's agitated feelings gradually became composed. It was from that time reported in the castle that Luitgarde was deeply enamoured of her cousin, and Frederick sought by all kinds of tender attentions to make himself deserving of this passion. Luitgarde felt this in a thousand careful attentions, in graceful efforts to anticipate her wishes, and to be agreeable to her. She had only to look, only to wish, so that whatever she required for her work, or for ornament, was instantly procured for her; she was forced to be on her guard, and not too loudly express her wishes, if she did not desire to be surrounded on all sides by attendants and obligations, in which her intended strove to display his own taste, and his love for her. These talents extended much farther; he began to undertake the settling in order the whole castle, he spoke to and contracted with the workmen, he managed every thing himself: he ornamented some rooms with his own drawings, he painted others, he was punctual, adroit, amiable, and full of knowledge and talent. Luitgarde discerned all this and prized his worth; she honoured his good heart. was fully decided to give him her hand; but, in solitary hours, or when a too delicate and elegant manner exhibited her cousin to her as feminine or weak, she was not entirely able to keep down a rebel feeling—quite another

kind of image would rise up in her mind, and seemed to carry her away to a comparison which she did not dare permit herself to make.

In the mean time, Frederick knew how to occupy himself in a hundred different ways, and Luitgarde strove with earnest mind to move in her old accustomed habits without repugnance, and to look forward to a new and holier relation with serenity; for the old count had fixed the marriage festival of his children for the next spring. But every coming guest, every inhabitant of the castle or village, who by chance had been at the neighbouring town, brought fresh stories of robbery and murder by Black Fritz. There were also comical jokes, arch tricks, or incomprehensibly hazardous enterprises narrated of him,—such as only excess of daring and contempt of every danger could suggest; actions by which the bold robber met seldom, in order to keep a foolish promise he had given, or to prevent an injustice, had staked his life, or even his liberty, which was still dearer to him, upon the die. Not without a palpitating heart did Luitgarde, since the affair of the Budweiss merchant, hear these narrations; although the ring on which was engraven a beautiful noble coat of arms seemed to bespeak a different station. However, it explained nothing really, and, in spite of an inward horror, a secret power always brought her back to the thought, which came to her mind with terror and still with inexpressible pleasure, that she had been probably near that much dreaded man;—near him, before whom all trembled; that she had received a proof of interest, indications of the tenderest respect, from that fierce and lawless individual. And this uncertainty, this enigmatical obscurity, wherein her relation to the unknown was enveloped, only served to awaken more frequently in her mind the recollection of the mysterious unknown.

But those casual relations and conversations were not the only things which perpetually brought that portrait before her mind. For some time, she had distinctly felt that she was surrounded by an unknown power, and observed secret influences of which she did not discover the author, but from the kind and nature of which she was able to associate intentions of the tenderest respect, perhaps of a still softer sentiment. Many a little wish, which she accidentally manifested, was accomplished; many a care which occupied her as mistress of the house, appeared as if by accident taken away from her; what she ordered for the house, or for her own use, in provisions or other necessary matters, came to hand through the very middle of the most troubled locality; and, whilst every place was full of deeds of robbery, at the castle all was in safety; for several miles round her residence profound tranquillity existed, and, in the most impenetrable forests which surrounded it, one might travel during the night with handfull of gold. It was as if a protecting divinity watched over that neighbourhood, and many a little theft which had been committed earlier on a tenant of her uncle, was now replaced in a mysterious manner. Every such incident struck a sharp arrow into Luitgarde's breast, and impressed a portrait now only too dear, still deeper upon her soul.

Some weeks before, she had accidentally at table expressed a wish to possess a parrot, such as she had seen at the house of one of her friends at Vienna. She spoke in a pleasant and laughing mood of the entertainment the bird would afford her in her solitary hours, when business or indisposition confined her uncle, and the pursuits of literature her cousin. But this conversation about the parrot and the pleasure of possessing it had long been forgotten, when suddenly on her getting up one morning, a singular cry struck her ear, and, going to the window from whence it came, she perceived with strange astonishment, a large cage attached to it, and in the cage was a handsome parrot! How did the cage come to her window, which, on the second floor of a castle built on a rock, was only accessible to the most daring adventurer? She called up every one in the house, and inquired of her cousin, who from the window

of the adjoining chamber could easily have been the cause of the unexpected occurrence. She had the bird taken in, she hastened down to her uncle, every body was surprised, no one could give any information. Indeed, Frederick proved to her by all kinds of little circumstances, that he could not have been during this night in that wing of the castle. All the people of the house were examined minutely, but nothing was discovered.

In the meantime Luitgarde kept possession of the bird, and amused herself with its various kinds of talk; she could not banish certain thoughts which gave it value to her, when she thought on the manner in which the cage was placed at her window. She was seized with the utmost surprise, when, one day, in a solitary hour, the bird suddenly cried out, "Victorin! ah, Victorin!" This name made her start and tremble; she sprang up and asked the bird who had taught him that word, just as if he could comprehend her, but the bird repeated his—"Ah, Victorin!" and Luitgarde, who instantly thought of the son of the beloved of her mother, and of him to whom she had been first affianced, felt an unspeakable alarm; it was to her as if she were surrounded by the spirits of the dead. But, shortly after, her clear understanding came back again, and she was ashamed of her fear; indeed, she petted the bird unceasingly, and allowed it to repeat the name, as often as it liked.

The bird, and the strange manner of its coming into the house, gave a lively interest to its inhabitants, most of whom found much amusement in the well-instructed, prattling little animal. The old count alone significantly shook his head, whilst he associated it with other mysterious events, with which an unseen power seemed to environ Luitgarde, and which could not fail to affect the members of her family. Count Frederick was in a very disturbed state; he inquired every where, he sought every where through the whole castle and its neighbourhood; he watched, but discovered nothing.

So passed some days, when a very distant relation of the family, the Countess Bellheim, came to visit it. Her property was a couple of days' journey distant, and only a pressing affair, which she had to transact with the old count, could have induced her to make such an expedition in the winter, and in the insecure state of the roads. She was received by everybody with joy, and Luitgarde, who had been so long without any intercourse with her own sex, led her the next morning after her arrival, to her apartment, where female occupations, dress, and a thousand such subjects, gave matter for an animated conversation, when suddenly the parrot raised its voice, and calling, "Victorin! ah, Victorin!" the eyes of the countess were turned on it.

"What is that!" cried she, amazed; "this parrot, here, in your chamber?"

"Do you know him?" exclaimed Luitgarde, seized with a frightful idea.

"It is my parrot," said the other; "I have had him many years, and he was taken away from me in a quite incomprehensible way."

Luitgarde stood before her—"I solemnly declare, I know nothing—"

"I am well persuaded of that," replied the countess, "but how did he come into your hands?"

Luitgarde related the history. The countess shook her head with astonishment—"Let him comprehend that who can," said she, "but, to convince ourselves whether I am right, or a singular resemblance leads me astray, be so good as to open the cage a little."

Luitgarde did so.

"Poll! poll!" said the countess, in a caressing tone; the parrot turned its neck towards the voice, shook its wings, and flew out of the cage straight to the countess, who held out her hand to him; he perched instantly on it, he fondled her, and thus recognised his former mistress, with every indication of attachment.

"The bird is yours," said Luitgarde, despondingly,

"I see it well, take him with you!" and she resigned it with bitter feelings.

The countess, however, refused; she had no wish to deprive Luitgarde of what gave her pleasure, and besought her to receive the bird, which before had been a stolen property, now honestly from the hand of a friend.

"Stolen property!" replied Luitgarde, deeply affected. "Yes, yes, you are right, countess!" said she, after a pause, "and I thank you for your offer, but I cannot accept it; the bird is distasteful to me since I know how I came by it."

The countess wished to persuade her in a friendly tone; she represented to her, that probably he who brought it to her with danger to his life, quite innocently—

"No, no," cried Luitgarde, hastily, "that cannot be!"

"How do you know?"

"I know nothing, indeed nothing," replied Luitgarde, quickly, "except that I can no more see the bird, and I beg of you to take him away with you when you return, for I—I will let him fly out of the window—What matters it to me!—O Heavens! he is indeed stolen."

The flow of tears which accompanied these words astonished the countess. She did not further attempt to explain them, and then decided to take her bird home with her. With various conversations, which, in order to amuse her deeply affected friend, she brought on the *tapis*, she at length calmed Luitgarde's agitation, and after awhile she became sufficiently tranquil to ask the countess, who in her house had the name of Victorin: and why the parrot always repeated that name with a sigh?

"Victorin!" said the astonished countess, "in my whole house there is no one of that name; he has never known that word so long as I have had him, which was nearly three years."

Luitgarde became silent and thoughtful.

"That is the name of your unknown knight, and he has taught the bird to pronounce his name, in order to put you in mind of him. This might serve as an indication—"

"Nothing, absolutely nothing!" Luitgarde, interrupting her warmly, exclaimed; "I know no man who bears that name!"

The countess did not press the matter farther, for she saw well how all that had reference to the bird excited Luitgarde in the highest degree; she kept her thoughts to herself, but could not avoid communicating a part of them to Count Frederick, the same evening.

He, who had been slightly informed of what had taken place, and of the agitation under which his intended bride laboured, had indeed no mistrust of anything. Excited by the narration of the countess, he wandered into various trains of ideas, but could not bring together his thoughts into any sort of consistence; he thought at least he had not much to fear from a rival who brought such equivocal presents, and which were given up again with so much indifference.

The countess was soon to take her departure; she had heard here in the castle accounts of all the bloody stories that were in circulation, and she became extremely uneasy, so that the old count saw no possibility of tranquillizing his relation, except by giving her a secure escort. "Willingly," said he, "would I myself perform the knightly service to my fair kinswoman, but my gout does not permit me in this weather to leave the house; so, Frederick, you must go instead."

"With much pleasure," replied the latter, standing up and bowing to the countess; but Luitgarde saw distinctly the unwillingness with which he undertook the charge.

However, there was nothing more to be done than to keep a good countenance at a losing game. The journey was undertaken on the following day, and Count Frederick reached his paternal habitation on the third

evening, fortunately, and in good health. Luitgarde came to meet him on the steps of the house; she was not entirely able to overcome some anxiety for the journey of her youthful friend, however kindly and seriously her uncle had spoken to her, and had advanced various reasonable grounds against this inquietude. The reason which made her apprehensive, and which even for her depended upon uncertain presumptions, she dared not name.

Frederick was satisfied with this proof of sympathy; he embraced her with true affection, and she soon discovered by his deportment that something significant must have taken place, which he had to communicate to her. "Only think, Luitgarde," said he—"stop, wait! my father must hear it too—Come now in." He drew her into the old count's chamber, and, immediately after the first salutations and informations, he was no longer able to retain his great piece of news.

"Father! Luitgarde!" said he, "think what has happened to me, what I have lived to see,—I have seen *Black Fritz!*"

"Black Fritz!" cried out both.

"Yes, yes! as large as life, and as near as I see you, and I have even talked to him!"

"With the robber chief!" said the father—"he is then taken?"

"Oh, no! that he is not," answered Frederick.

"Have you been attacked?" inquired Luitgarde, with an air of fear.

"God forbid!" replied Frederick—"I have spoken to him, as I speak to you, tranquilly, peacefully."

"Now, in God's name," said the old count, impatiently, "relate the affair."

And Frederic began. "This morning I was delayed at the first stage from the countess' castle, for some time, waiting for horses. I thought it right, for my own safety, to conceal my rank and my name; I asked for no private room, but took my place in the common one; all kinds of people were there; peasants, parish and public officers, and some of those dragoons, whose duty it is to patrol the country. They were boasting and laughing, and relating all kinds of wild anecdotes of the robbers, and how, on two different occasions, they had been already on the track of *Black Fritz*; how he keeps his habitation in that neighbourhood, and so on; all which was not quite to my taste, when I reflected that the waiting for the horses might force me to travel by night. Just then the door opened, and there entered a priest, followed by his schoolmaster. He was a young man of good figure; his exterior, his profession, even his look, if I might so say, imposed silence on the vulgar crowd; he had some wine for himself and his schoolmaster, of which he drank moderately, and remained silent. By-and-by, the dragoons began to bravado; they affirmed they knew *Black Fritz* well; they represented him with frightful features, and declared that if ever again they were to fall in with him, he should no longer escape them.

"The priest now stood up, placed himself opposite them, and asked them, 'If they were so certain of their affair, why did they not put an end to the man's frightful occupation long since?' The dragoons bravadoed, and bullied, and talked away as raw soldiers are accustomed to do; the clergyman carried on his jest with them, which I was clearly able to see, and it seemed to amuse him to hear how highly and valiantly the fellows estimated themselves, and what they meant to do with *Black Fritz*, if they came in contact with him.

"And suppose he were here in the midst of you?" said the priest, with a tone which frightened the dragoons, and which I confess made my blood for a moment curdle. We all looked at each other, each feared to discover in his neighbour the dreaded robber. In the mean time, the schoolmaster had returned to the room, from which he had absented himself, and gave a wink to the priest.

"*I AM BLACK FRITZ!*" roared out the last, with a

voice of thunder, in the midst of the terror-struck assembly; threw down his false hair, and stood terrific, but handsome, in his black curled locks, while at the same time he drew forth a pistol, and held it before him—"Let him approach me who dare," cried he. The pretended schoolmaster exhibited an enormous sabre, and covered his master's retreat. We all stood in amazement, and the robbers disappeared."

"What the deuce!" cried the old count, "that is too bad! Are you not ashamed? Was there not one of the fellows willing to run the risk?"

"But, dear father, the smallest party was armed."

"And have you not followed him?"

"Yes, indeed, the dragoons instantly sprung up, but the girths of their saddles were cut away, and when they wanted to mount they tumbled over, with cloth and saddle, from their horses, while the two robbers, with a jeering laugh, leaped on their horses, and flew off swift as the wind."

"Now, this is too ridiculous!" said the father, "a whole chamber full of men, and soldiers among them, and two robbers, who made themselves known in a deriding manner, could not be taken!"

Count Frederick endeavoured to explain and excuse the matter, but the father kept his own opinion, and asserted that it was an eternal shame, while Luitgarde thirsted with desire to ask her cousin for a description of *Black Fritz*—at last she ventured to do so.

"Permit me, fair cousin, that this remain for the present my secret," replied he; "in a few days thou shalt be fully and more than satisfied."

Luitgarde was obliged to yield, but she was now less able than ever to banish a certain image from her mind, or keep off the unpleasant idea that her cousin had played but a sorry part with the audacious robber.

POPULAR YEAR BOOK.

November 9.—Lord Mayor's Day.

This day has received the above designation in allusion to its being the period when the chief magistrate of the city of London annually enters upon his mayoralty. Prior to the alteration of style in 1752, this anniversary was held on the 29th of October. The amphibious procession of the corporation to the city of Westminster and back—the most remarkable of our civic displays—is too familiar to our readers to need a description here. A high authority in mediæval antiquities considers it a very interesting exhibition, inasmuch as it bears a close resemblance to the ancient pageants. It cannot vie, however, with the "Lord Mayor's Show" of former days, as described by a writer in 1575. "The day of St. Simon and Jude," says Master William Smythe, 'citizen and haberdasher of London,' "the Lord Mayor enters into his state and office. The next day he goes by water to Westminster, in a most triumphant-like manner, his barge being garnished with the arms of the city; and near it a ship-boat of the Queen's Majesty being trimmed up and rigged like a ship-of-war, with divers pieces of ordnance, standards, pennons, and targets of the proper arms of the said mayor, of his company, &c.; next before him goeth the barge of the livery of his own company, decked with their own proper arms; then the bachelors' barge, and so all the companies in London, in order, every one having their own proper barge, with the arms of their company. And so passing along the Thames, he landeth at Westminster, where he taketh his oath in the Exchequer, before the judge there; which done, he returneth by water as aforesaid, and landeth at Paul's Wharf, where he, and the rest of the aldermen, take their horses, and in great pomp pass through Cheapside. And first of all cometh two great standards, one having the arms of the city, and the other the arms of the mayor's company; next them two drums and a flute,

then an ensign of the city, and then about seventy or eighty poor men marching two and two, in blue gowns with red sleeves and caps, every one bearing a pike and target, whereon is painted the arms of all them that have been mayors of the same company that this new mayor is of. Then two banners, one of the king's arms, the other of the mayor's own proper arms: then a set of hautboys playing, and after them certain whiffiers [or staff bearers], in velvet coats and chains of gold, with white staves in their hands; then the *Pageant of Triumph*, richly decked, whereupon by certain figures and writings some matter touching justice and the office of a magistrate is represented. Then sixteen trumpeters, eight and eight, having banners of the mayor's company: then certain whiffiers as before: then the bachelors, two and two, in long gowns, with crimson hoods on their shoulders of satin; which bachelors are chosen every year of the same company that the mayor is of, and serve as gentlemen on that and other festival days, to wait on the mayor, being in number according to the quantity of the company, sometimes sixty, or one hundred. After them, twelve trumpeters more, with banners of the mayor's company; then the drum and flute of the city, and an ensign of the mayor's company; and after, the waits of the city in blue gowns, red sleeves and caps, every one having a silver collar about his neck. Then they of the livery in their long gowns, every one having his hood on his left shoulder, half black and half red, the number of them according to the greatness of the company of which they are. After them follow sheriff's officers, and then the mayor's officers, with other officers of the city, as the Common Serjeant and the Chamberlain; next before the mayor goeth the sword-bearer, having on his head the cap of honour, and the sword of the city in his right hand, in a rich scabbard set with pearls; and on his left hand goeth the common crier of the city, with his great mace on his shoulder, all gilt. The mayor hath on a long gown of scarlet, and on his left shoulder a hood of black velvet, and a rich collar of gold of SS. about his neck, and with him rideth the old mayor also, in his scarlet gown, hood of velvet, and a chain of gold about his neck. Then all the aldermen, two and two (among whom is the recorder), all in scarlet gowns; those that have been mayors have chains of gold, the others have black velvet tippets. The two sheriffs come last of all, in their black scarlet gowns and chains of gold. In this order they pass along through the city to Guildhall, where they dine that day, to the number of one thousand persons, all at the charge of the mayor and the two sheriffs. Immediately after dinner they go to St. Paul's church, every one of the aforesaid poor men bearing staff, torches, and targets, which torches are lighted when it is late, before they come from evening prayers."

The last Lord Mayor who rode on horseback on this occasion, was Sir Gilbert Heathcote, in the reign of Queen Anne. The procession to and from Westminster was by land, until the year 1435, in the reign of Henry VI., when Sir John Norman built a sumptuous barge at his own expense, for the purpose of going by water. The twelve companies, emulating their chief, have, from that period, "graced the Thames" on Lord Mayor's day.

"All that remains," says Hone, "of the Lord Mayor's Show, to remind the curiously informed of its ancient character, is in the first part of the procession, wherein the poor men of the company to which the Lord Mayor belongs, or persons hired to represent them, are habited in long gowns and close caps of the company's colour, and bear painted shields on their arms, but without javelins. So many of these head the show as there are years in the Lord Mayor's age.

November 11.—*St. Martin's Day.*

St. Martin, the son of a Roman military tribune, was born in Pannonia, now called Hungary, about A.D. 316.

For some time he followed his father's profession. It is related, that at the gate of Amiens he divided his cloak with a poor mendicant, and that on the following night our blessed Lord appeared to him wrapped in that half of it which he had parted with, and said to his angelic retinue, "Martin has given me this garment." This vision occasioned the saint to leave the army, and retire into solitude, from which he was withdrawn by St. Hilary, Bishop of Poitiers. He was elected Bishop of Tours in 374. The zeal and piety which he displayed in this office were most exemplary. He converted the whole of the diocese to the true faith, levelling the temples of the heathens with the ground, and erecting, in their stead, churches for the worship of the true God. The Emperor Valentinian, and even the tyrant Maximus, treated him with respect and honour; and he continued in his bishopric, universally beloved and esteemed, until A.D. 400, when he departed to glory, at the advanced age of eighty-four years. St. Martin has been styled THE APOSTLE OF GAUL. The French had formerly such reverence for his memory, that they carried his helmet with them in their wars, as an incitement to courage. His festival was instituted A.D. 650, and is one of the four cross quarter days. It is commemorated in the Anglican Church Kalendar, as is also that of his translation on the 4th July. The former is still called in law, MARTINMAS, from which it has been corrupted to Martle, or Martionmas. "Formerly," says Brady, "the feast of this saint was denominated Martimalia, and was held with much festivity, in close resemblance to the VENALIA of the Romans, which had been instituted in honour of Jupiter and Venus." St. Martin is the patron of the Vintners' Company, London. St. Martin's *little summer* is a term for the nine days which sometimes occur about the beginning of November.

OLD AND POPULAR CUSTOMS.

A usage anciently prevailed everywhere in England, though generally confined at present to country villages, of killing oxen, &c. at this season. In Tusser's "Five Hundred Points of Husbandry" are the following lines:—

"When Easter comes, who knows not than
That veal and bacon is the man?
And *Martimus beef* doth bear good tack
When country folk do dainties lack."

Brand observes, that rustic families in Northumberland still club at Martinmas to buy a cow, or other animals, for slaughter, the entrails of which, after having been filled with a kind of pudding meat, consisting of blood, suet, groats, &c. are formed into "little sausage links," boiled, and sent about as presents, under the name of black puddings. A custom somewhat similar to this formerly prevailed in Germany, where there was at this time, a kind of entertainment called the "Feast of Sausages, or Gut Puddings," which was wont to be celebrated with great joy and festivity. On the continent St. Martin's day is a great festival: new wines then begin to be tasted, and the hours are spent in carousing. Dr. Stukeley remarks, that St. Martin's day is marked with a goose in the wooden almanacks of Norway: for on that day they always feasted with a roasted goose. "They say," he adds, "St. Martin, being elected to a bishopric, hid himself, but was discovered by that animal." The same bird, we are informed, is one of the delicacies "in common use" at every table on the continent at Martinmas: and that such was also formerly the case in England, appears from the following account in the "Popish Kingdom," of the fashion in which the Feast of St. Martin was celebrated by our ancestors:—

"To belly cheer yet once again doth Martin more incline,
Whom all the people worshipeth with roasted geese and wine:
Both all the day long, and the night, now each man open makes
His vessels all, and at the most outtime the last he takes,

Which holy Martin afterwards alloweth to be wine;
Therefore they him unto the skies extol with praise divine,
And drinking deep in tankards large, and bowls of compass
wide.

Yes, by these fees, the schoolmasters have profit great beside:
For with his scholars, every one about do singing go,
Not praising Martin much, but at the goose rejoicing tho',
Whereof they oftentimes have part, and money therewithal,
For which they celebrate this feast, with song and music all."

November 13.—On this day the Stamford bull-running annually takes place. This custom is said to have originated as follows:—William, Earl of Warren, in the time of King John, standing, it is said, upon his castle wall, saw two bulls fighting for a cow in the fields below. A butcher of the town of Stamford, owner of one of the combatants, accidentally coming by with a huge mastiff, set the dog upon his own bull, who fled into the town, and no sooner entered it than all the butchers' dogs in the place, great and small, followed him in hot pursuit. By this time the enraged fugitive had become stark mad, and ran over everything in his path. The town was soon in an uproar, and so great was the noise, that the Earl of Warren rode with all speed to the scene of action, and was so delighted with the spectacle, that he gave all the meadows in which the bulls were at first found fighting as a common to the butchers of Stamford, upon the condition, that upon the anniversary of the day of the bull-chase, the butchers should from time to time, yearly for ever, find a representative of the original Taurus for the continuance of that amusement.

The manner in which the sport is now conducted is briefly this:—The bull is shut up during the night, before the appointed day, in a place provided for the purpose. At eleven o'clock a.m. he is released from his prison, generally into a street, stopped at each end, which he parades "in majesty sublime." At this juncture every post, pump, and wall is in requisition. The carts and waggons which form the barrier at the ends of the street are crowded with individuals, and, in a word, every place tenable is occupied. Some years back it was usual to irritate the bull, by goading him with pointed sticks, but this practice is now wholly abolished. Frequently a hoghead, with both ends knocked out, is brought, wherein a man places himself, and, by rolling it to the bull, provokes him to toss it. He tosses, but tosses in vain; its inmate is trained too well to be easily dislodged. By this and other means equally harmless, he is rendered sufficiently infuriated for the "running." The street is then "unstopped," when, all agog, men, boys, and bull tumble one over the other to get free. *Bridging the bull* is next thought of. This, if he be much enraged, is the most dangerous part of the fun; it consists in driving him upon the bridge, (which is a great height above the water) and forcing him into the waves below. Crowds of persons press upon him on three sides, and at length, in spite of his amazing powers, he yields to the combined strength of his opponents,—he plunges into the river. On rising to the surface his first care is to land, which, in most cases, he does in the meadows, where the chase continues until night puts a stop to the proceedings. The baited animal is then slaughtered, and his carcass sold at a reduced price to the lower classes, who regale themselves with a supper of bull beef. A frequent eye-witness of the above singular custom affirms that it is not nearly so cruel as some represent it to be. "Fatigue," he observes, "is the greatest pain the bull is subjected to; and, on the other hand, the men who so courageously cope with him are in imminent danger of loss of life or broken limbs, whilst they possess not the most distant idea of doing anything more injurious to the animal than irritating him."¹

(1) Is it possible that this senseless and brutal custom is still in observance?—EDITHA.

November 17 is the anniversary of QUEEN ELIZABETH'S accession, and was long observed in this kingdom as a Protestant Festival, with public prayers, processions, and illuminations. The figures of the Pope and the Devil were usually burnt on this occasion. In the "Gentleman's Magazine" for November 1760 is an account of the remarkable cavalcade on the evening of this day, A.D. 1679, at the time the bill for excluding the Duke of York (afterwards James II.) from the throne of England was in agitation. We are informed in the above narrative that the procession in question set forth at Moorgate, and passed first to Aldgate, thence through Leadenhall-street, by the Royal Exchange and Cheap-side, to Temple Bar, in the ensuing order; viz.—Six whiffers to clear the way. A bellman ringing, and in loud and doleful tones crying out, "Remember Justice Godfrey." A figure of the justice, carried on horseback before a Jesuit in black. A priest in a surplice, and a cape embroidered with skulls, &c., distributing pardons. A priest in black, with a silver cross. Four Carmelites. Four grey friars. Six Jesuits, with bloody daggers. A concert of wind music. Four bishops, in purple and lawn sleeves, with pastoral staves in their hands. Four other bishops, with surplices and rich embroidered copes, and gilt mitres on their heads. Six cardinals in scarlet robes and caps. The Pope's doctor, with Jesuits' powder, &c. Two priests in surplices, with golden crosses. Lastly, "the Pope, in a lofty glorious pageant, representing a chair of state, covered with scarlet, richly embroidered and fringed, and bedecked with golden balls and crosses. At his feet a cushion of state, and two boys in surplices, with white silk banners, and bloody crosses, and daggers, with an incense pot before them, censuring his holiness, who was arrayed in a splendid scarlet gown, lined through with ermine, and richly daubed with gold and silver lace; on his head a tripple crown of gold, and a glorious collar of gold and precious stones, St. Peter's keys, &c.," and at his back, not an effigy, but a person representing the devil, acting as his holiness's privy-counsellor, and "frequently caressing, hugging, and whispering him, and oftentimes instructing him aloud." The whole procession was attended with some thousands of individuals carrying flambeaux and lights. The statue of the Queen on the inner or eastern side of Temple Bar having been conspicuously ornamented, the figure of the Pope was brought before it, when, after a song, partly alluding to the protection afforded by Elizabeth to Protestants, and partly to the existing circumstances of the times, "his holiness, after some compliments and reluctances, was decently toppled from all his grandeur" into the flames of a huge bonfire prepared for his reception.

The Pope-burning processions, of which this is, perhaps, the most remarkable example, were promoted by the party in opposition, for the express purpose of inflaming the public against the Court, and they were carried on under some common direction, which assigned the actors their parts, and prescribed the methods by which they should arrange their spectacles. These exhibitions were very properly put down by government in 1681.

BOOK OF HIGHLAND MINSTRELSY.¹

THE title of this very pleasant book is rather apt to mislead. It is not, as might be supposed, a collection of the traditional poetry of the Highlands, as Scott's 'Minstrelsy of the Scottish Border' is of that of the southern part of Scotland, but a volume of poems by Mrs. Ogilvy herself, founded upon a variety of historical and traditional incidents, collected from an evidently

(1) "A Book of Highland Minstrelsy." By Mrs. D. Ogilvy. With illustrations, by R. R. Melan. London: Nicklison. 1846.

familiar acquaintance with the character, habits, and history, of our Highland countrymen. We cannot say that we think Mrs. Ogilvy's choice of subjects has been, in every instance, the happiest possible. She might, we feel assured, have found, among the multitude of Highland traditions, many better fitted for poetic handling than some of those she has chosen. Such as they are, however, she has made a good use of them; and her volume, if not ranking among the highest poetical achievements of the day, must be assigned an honourable place at the head of those of the second class.

The peculiar features of character by which the Highlanders of Scotland were long distinguished are rapidly becoming effaced, as the peculiarities of condition from which they sprung are disappearing before the inroads of modern improvement and innovation. Let us not be grudged the slight feeling of regret, founded, we admit, rather in sentiment than in reason, with which we contemplate this change. There is no tree, however useless and unsightly, which, if we have been accustomed to look upon it all our lives, we can see at last grubbed up, without some slight twinge of sorrow, in spite of our full persuasion of the necessity for its destruction. The conviction that what is removed can never again return—that the torch which is extinguished can never again be lighted—that years, as they roll, will bring many changes, but will never restore that from which we are now parting,—throws an involuntary shade of sadness over the general satisfaction with which we contemplate changes in the character and habits of a people, flowing from their advancement in civilization, and from what is an undeniable improvement, in many respects, in their condition.

It must be admitted, perhaps, that those semi-barbarous peculiarities, which constitute the poetical element in the character of a race, owe their interest mainly, if not altogether, to the fact which their sentimental admirers deplore—that they have disappeared, or are in the act of disappearing. Many an eye "in a fine frenzy rolling" looks with delight upon the mountain robed by distance in its azure hue, whose owner would little relish being compelled to take up his abode among the mists, and drifts, and roaring torrents, of the mountain side. A cateran is an infinitely more poetical personage after he is dead, and when his deeds are recounted by the side of a warm fire, under the shelter of constables, and police, and magistrates, who, as Bailie Jarvie says, "do not bear the sword in vain"—than he would be deemed by a man awakened at midnight by the screams of his household to see his barn in flames, and to hear the farewell lowing of his precious three-year-olds as they trotted before the bare-legged ravisher up the glen. The common lament for the departure of "the good old times" is most probably less the result of a specific admiration for any of the incidents of those times in particular, than the expression of the general feeling with which we look upon that line in our mental horizon which is just disappearing from view; a feeling which, let us be at what point of our progress we may, will always find wherewith to exercise itself, and of which our own times will be the object to our grandchildren, just as are to us the times of our grandfathers, who in their turn looked back with similar feelings of veneration and regret upon times which are altogether hidden from our view. There is nothing easier than to ridicule the feeling of respect for the character and manners of "the olden time." The ridiculous points about it, which are numerous enough, are obvious to the dullest, and are sure to be sufficiently

paraded by those who take up admiration for antiquity as a trade. But, if we will look more deeply into the matter, we shall find that it has something more and better in it than a childish affectation of reviving exploded follies, or the mere cant of enthusiasm for reverend antiquity. It speaks the clinging of the affections to the soil where their roots have been early planted—the unwillingness of generous minds to part for ever with what is associated, however remotely, with the objects of their love and veneration—and the natural tendency of men of ardent benevolence to prefer, to the smooth level of equal rights and general independence which marks the present day, a state of society in which, if the happiness and comfort of the mass of the people were less perfectly secured, and left more at the mercy of the individual characters of men of rank and power, there was, for that very reason, more scope for the exercise of a class of virtues the most captivating in their aspect, as infusing into the social relation those feelings of reciprocal attachment and veneration, which, in their gentle development, cast so exquisite a charm over the family circle.

But to return to the Highlanders. The peculiarities of character by which they have been distinguished are easily referable for their origin to the circumstances in which they were placed. Inhabiting a mountainous country, seldom approached by visitors from other parts of the world, their ideas necessarily circled within a narrow round. The character of the country, of which the habitable part consisted of valleys separated from each other by nearly impassable ranges of mountain, must have greatly contributed to, if it did not altogether create, those peculiar feelings, so ardent in their good and in their evil, which are connected with the system of clanship. The limits of their valley marked out at first the natural boundary of settlement for families issuing from a common stock. The affections, centred in this narrow spot, were not taught to expand by freedom of intercourse with other families, who were too distant, and too difficult of access, for any easy interchange of friendly offices, though both distance and difficulty could at any time be overcome at the instigation of the more active feelings of hostility and revenge. Thus the Highlander's affections were all thrown inward, with an intensity of glow greatly increased by their forcible compression, upon himself, his family, his kindred, and the head of his clan; his angry passions only had room to throw out their shoots into the outer world. When he ventured to overstep the limits of his narrow home, he found only strangers or foemen—strangers made foemen by some of the numberless causes of quarrel, sure to arise at the casual meeting of men to each of whom his own little community was the world, and who, therefore, went abroad bristling at every point with feelings and jealousies which it was scarcely possible to avoid touching, and which could not be touched without giving mortal offence.

The exclusive devotion of the Highlander's affections to his own clan, and his limited acquaintance with the rest of the world, naturally gave birth to ideas of personal and family consequence, which, though they appear ludicrous enough when measured by the standard usually applied to such things, were not without a very beneficial influence upon his own character. In his eyes his chief was the greatest man in the world—his clan the noblest race of living men. Not one of the clan but had the blood of the chief in his veins, and not one, therefore, but had some degree of hereditary dignity to sustain. If this feeling led to some incongruous absurdities in their rare intercourse with the rest of the world—if it had the still worse effect of carrying down into the lowest grade of society the gentlemanlike vices of quarrelsomeness and revenge—it had no less the effect of throwing over the character of the lowest Highlander a feeling of self-respect, and of imparting a dignified polish to his manners, of which corresponding examples can scarcely be found among any other people in the

world. The barbarism and lawlessness attributed, with justice, to the Highlander till within the last hundred years, were purely relative. To the world at large he was barbarous, because he did not understand its usages—he was lawless, because he did not consider himself bound by its laws. But within his own circle, where alone he felt that he owed obedience and respect, no man was more observant of those habitual courtesies which constitute the greatest charm of polished life; or more implicitly subservient to all the laws by which his society was bound together. The absurdities and vices, flowing from the feeling of personal consequence we have attempted to describe, have almost entirely disappeared under the influence of an enlarged acquaintance and more frequent intercourse with the world; its benefits still remain to dignify and elevate the Highland character. In no part of the world, at this day, do men of very limited fortunes occupy a higher place in the social scale—no where are they more fully imbued with the feelings, or more liberally endowed with the qualifications, which raise and maintain men above the common level.

The poetical elements in the Highland character are easily deduced from its general features. Their mode of life, active, but not laborious—full of enterprise and adventure, and free from the toil which depresses the spirit and cramps the faculties—gave full scope to the development of passion and imagination. Their little communities, with their rivalries, hostilities, and alliances, were each a theatre within whose narrow bounds the whole round of human feelings and passions were displayed and brought into play. The objects might be trifling and insignificant, but the passions and feelings were as active and vigorous as if they concerned the struggles of empires; and all the more picturesque in their exhibition, from the limited field to which they were confined. And from the closer contact of the hostile communities, and the greater importance in every struggle of each individual, the public feelings of friendship or hostility for the friends or enemies of the clan, were more dramatically interwoven than can often take place in the struggles of nations,—with the private feelings of individuals, which, either flowing with those public feelings, gave them greater vigour or intensity, or, running counter to them, disturbed the current by a conflict full of the richest elements of poetry.

All these peculiarities of Highland circumstances and character are now no more. The inaccessible character of their country has been destroyed. Clanship is little more than a tradition, or a fond memory lingering in the hearts of a few, who are unwilling to lose sight of the last distinguishing peculiarity of their native race; the enmities of rival clans have been laid asleep; and with that the exclusive devotion of clansmen to their chief and to each other has been cooled down. The few remaining points of distinction between the population of the Highlands and the other parts of the country, are wearing away day by day, and we shall, by and by, have only such books as Mrs. Ogilvy's Highland Minstrelsy, to furnish us with any knowledge regarding what once constituted so picturesque a feature in the character of the northern half of our island.

We have too long detained our readers from the slight taste we mean to give them of Mrs. Ogilvy's muse. We cannot attempt any general analysis of her book, but we select two poems as very favourable specimens of her powers in different styles. Each poem is prefaced by some general observations of a very interesting character illustrative of the story, and in general necessary to a full understanding of it. The first is founded upon the superstition of the "second sight," and is thus introduced:

"It has been well said by Mrs. Grant of Laggan, that the second sight of the Highlanders differed from all heathen divinations in this important respect, that it was entirely involuntary. It is described by this elegant and imaginative essayist,

as a 'shuddering impulse, a mental spasm, that comes unsought, and often departs without leaving a trace behind by which it may be connected with any future event.

"The Highland seer did not go about like Balsam, to seek for enchantments; his gift was a fatality, and was generally as unwelcome as unlooked for. He was not consulted by those curious to pry into futurity; he made no trade of imposture; no honours were attached to this mysterious endowment; the prophet was shunned rather than regarded by the vulgar. Instead of possessing, he was possessed by the spirit within him, over the working of which he had no control."

"The seventh son of a seventh son was supposed, by the accident of his birth, to be gifted with this unenvied power. The consciousness of being so considered by those around him, would of itself foster in the mind of the unfortunate child a dreamy habit of reflection, an abstraction of manner, and a feeling of being unlike others, calculated as he grew to manhood to isolate him more and more from his fellows, and to teach him to people with apparitions the solitude of his soul. Such a character is that attempted to be portrayed in the following ballad:—

MARY OF THE OAKENSHAW.

"It was upon a summer night,
A tranquil night of June,
We rested on our idle cars
Beneath an amber moon,
That mirrored upon Crinan's loch
Thy ruined walls, Duntroon!
The sky was calm, the air was balm,
The night was clear as day,
Our eyes could trace each wooded isle
On Crinan's breast that lay,
And e'en the mist of Scarba's hills
Far out beyond the bay.
It was a night to meditate,
But full of speech were we,
As lark that singeth from the cloud,
Or mavis from the tree;
There was Mary of the Oakenshaws
With Willie Bhane and me.
Sweet Mary of the Oakenshaws
So thrillingly she sung;
No burn above its mosses flowed
So smoothly as her tongue,
No bluebell e'er so beautiful
In cleft of granite hung.
I scarce had hoped to mate with her,
Yet she to me was vowed,
And blushed so full of happiness,
That well I might be proud;
For I had won her manfully
From all the rival crowd.
And Willie Bhane, no common youth
Was fashioned like to him,
Of lineage so feminine,
So delicate of limb,
With eyes where saddest sentiment
Well'd ever o'er the brim.
A stranger to our mountain shores
In earliest youth came he,
His mother was a dark eye'd dame,
From climes beyond the sea;
There was a spirit in her mien,
That spake of ancestry.
There was a lightning in her glance,
Although her tones were mild,
And there were sad and cloudy cares
Upon her forehead piled;
She never gazed as mothers gaze
Upon an only child.
But silent in that fisher glen
She dwelt where first she came,
And if her homely neighbours asked
Of lineage or of name,
She said, 'He is a seventh son,
His father was the same.'"

The ballad goes on to tell the effect produced on the boy's character by the mysterious influence supposed to

belong to the circumstance of his birth—how the fishers feared to meet him alone, and how he did not mingle with other boys, but strayed away by himself, climbing the loftiest and most dangerous rocks, “to watch the sunset on the sea,” and how he became the best and boldest boatman on the lake.

“But most his mood was pensiveness
When he would dreaming lie,
As if beneath the bubbling wave
Strange visions met his eye,
And whoso next he looked upon,
They said was soon to die.

Thus half we clung to him in love,
And half we shrank in dread,
Until he grew to be my friend
And hers, that maiden dead,
And words of angel sympathy
To him she pitying said.”

The natural consequence followed—he loved Mary of the Oakenshaws—was necessarily rejected, and leaving her without upbraiding or complaint, went to sea.

Again he returned, and met the lovers as they were preparing to cross the loch. He warned them against the attempt, foretelling that it would end in disaster; but his warning was disregarded, and then he sprung into the boat beside them, that he might share Mary's fate. It was a lovely evening as they returned from their excursion, so lovely that

“E'en Willie Bhane in that repose
Forgot his fatal gift.”

The catastrophe is thus told :—

“Then one by one we sank in thought,
And each began to muse;
Our hearts absorbed the gentle calm
As flowers the summer dews,
When Mary's voice spontaneously
Its magic did infuse.

So sweet she sang, so soft she sang,
She wiled our hearts away;
Forgetful of the helm and oar
We drifted from the ray
Of moonlight to the darkest shades
And shallows of the bay.

So sweet she sang, so sad she sang.
Our tears she did unlock;
When, all unstrered, the helpless boat
Drove rudely on a rock,
And by an eddying tide engulfed
Heeled over in the shock.

The music still was in our ears
Of that entrancing burst,
When we were struggling for our lives
In chilliest waves immersed,
And madly grasping at the clothes
Of her who sank the first.

’Twas but a second—swimmers strong,
We both the deep could brave,
And near us lay the sheltering land,
But she was in the wave,
And Willie Bhane sank hopelessly
With her he died to save!”

The other poem, of which we extract a part, “The Vow of Ian Lom,” relates to a very remarkable character. Ian Lom Macdonald was born, says Mrs. Ogilvy—

“In the reign of James VI. of Scotland, and lived, it was alleged, till that of Queen Anne, a spectator and eloquent denouncer of the union of the two kingdoms. His poetical genius was of a high order, entirely devoted to the Jacobite cause, which he advanced as much, if not more, by his songs as others did by their claymores. He accompanied Montrose in most of his marches, and commemorated his victories. Charles II. created him Gaelic Poet-Laureate, a distinction of which he was justly proud, and which, beginning in his person, died in his death, never having been conferred on a successor. Ian Lom's last fight was the fatal victory of Killiecrankie, where he had gone with

Dundee, whose hapless fall in the very heat of success he laments with even more than his accustomed fervour. The story of the poem is strictly true. The two young Macdonalds of Keppoch, chieftains of the tribe to which Ian Lom belonged, were murdered by a family of the same name, a father and six sons, who were tacksmen on the lands of Keppoch, and had some private quarrel with the youths. The uncle of these unhappy brothers was present, but neither interfered to prevent the deed, nor took any subsequent steps to bring the criminals to justice. But the devoted and intrepid Scannachie was bound to his chieftains by closer ties than those of relationship. Indignant at the kinsman's apathy, he went from house to house, and from castle to castle, calling for vengeance on the assassins. After many fruitless attempts, he at last obtained from government a commission to take the murderers, dead or alive, and from Sir James Macdonald of Sleat, a body of men sufficient to execute the commission. The seven guilty men defended themselves with unparalleled bravery, barricading their house, and fighting till they fell dead beside their own hearthstone. Ian Lom has preserved the dirk with which they had slain their chieftains, and its edge was now turned against themselves.”

THE VOW OF IAN LOM.

“Through the beeches by the river,
In whose shades a man might lurk,
Who is he that wildly searcheth,
Brandishing a dripping dirk?
On the night air, gurgled, babbling,
Streams the mantle at his back,—
Ian Lom, the Blood Avenger,
Hurrying on the murderer's track!

Whither fled those catiff brothers,
When the assassin's work was o'er?
To the fastness of the mountain—
To the caverns on the shore?
Doth the kinsman's wrath pursue them,
In whose sight the deed befel?
Or at peace, upon their homestead,
Are the guilty left to dwell?

Now with screaming of the pibroch—
Now with coronach and cry,
Clansmen bear the sons of Keppoch
In their father's grave to lie.
Wherefore silent is the minstrel?
Chants he not their young renown,
Who went forth in manhood's glory
Where the red hand struck them down?

Ere the rites are fully ended—
Ere the mourners hie them home,
In the midst, with head uncovered,
‘Hear me vow!’ quoth Ian Lom,
‘Till my chieftains be avenged
Song shall be foresworn by me,
Woman's heart and woman's beauty,
Minstrel's praise and minstrel's fire!’

On his brows he thrust his bonnet,
Turned and strode along the vale,
And the clansmen of Macdonald
Answered with a thrilling wail.
Deep it swelled from manly bosom,
Silvery sad from woman's tongue,
On the fresh-heaped grave of Keppoch
Like a cloud of grief it hung.

Oh! the minstrel's words were mighty,
And the minstrel's soul was strong,
With a more than mortal passion
Writhing to avenge the wrong.
Journeying swift to hall and castle,
Fearlessly he told his tale,
Crying, ‘Vengeance for the orphans
Is the glory of the Gael!’

Journeying swift by firth and ferry,
Early starting, resting late,
Soon he reached the knight Macdonald
On the distant shores of Sleat.
Loud the minstrel's voice resounded
Through the rugged halls of Knock,
And he shook the chief with passion,
As the earthquake shakes the rock.

'Faithful vassal, truthful minstrel,
By the fell or by the flood;
I will find those sons of Dougal—
Shedders of the guiltless blood!
Forth he sent, that western chieftain,
Clansmen armed in strong array,
Ian Lom, the Blood Avenger,
Went to guide them on their way—

Hunted home into their dwelling,
Strongly barred with stone and wood,
Pale of face, but firm of purpose,
By the door those traitors stood.
Seven were they, sons and father,
Stalwart men to wield the brand,—
'Twas a strife of desperation
At the meeting hand to hand.

Broken down their vain defences,
One by one they fell and died,
And the sire upon his hearthstone
Sank at last his sons beside.
Through thy woody paths, Glengarry,
Marched the victors of that fray,
In the waters of thy fountain
Seven heads were laved that day.

Sternly parting from the corpses,
Left to blacken on the ground,
Ian Lom returned rejoicing,
For the vengeance he had found.

Girt through life by war and tempest,
He was great in his degree,
For he sang, Montrose, thy glory,
And he wailed thy fall, Dundee!
Kings arose and kings descended
Unlamented to the tomb,
Ere the coronach was pealing
For the death of Ian Lom.

Nor with life his greatness perished,
Left undying in his song
Words familiar by the fireside
When the winter nights were long;
Words familiar, ever chanted
To the bride when she was wed,
To the babe when it was christened,
To the corpse when it was dead:

By the shepherd in the shealing,
By the lady in her home;
Wheresoever men were gathered
Went the songs of Ian Lom.
And his voice again was breathing
From the grave a trust and power,
When the Stuart sailed for Scotland
In a dark and evil hour.

Mightier was the verse of Ian
Hearts to nerve, to kindle eyes,
Than the claymore of the valiant,
Than the counsel of the wise.
Still he singeth unforgotten
In the echoes of his home;
Every burn and every mountain
Tells thy glory, Ian Lom!"

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

INTEGRITY REWARDED.

THE ANNALS of the American War record the following story:—"A plain farmer, Richard Jackson by name, was apprehended, during the revolutionary war, under such circumstances as proved, beyond all doubt, his purpose of joining the king's forces, an intention which he was too honest to deny; accordingly he was delivered over to the high sheriff, and committed to the county

gaol. The prison was in such a state, that he might have found little difficulty in escaping; but he considered himself as in the hands of authority, such as it was, and the same principle of duty which led him to take arms, made him equally ready to endure the consequences. After lying there a few days, he applied to the sheriff for leave to go out and work by day, promising that he would return regularly at night. His character for simple integrity was so well known, that permission was given without hesitation, and for eight months Jackson went out every day to labour, and as duly came back to prison at night. In the month of May the sheriff prepared to conduct him to Springfield, where he was to be tried for high treason. Jackson said this would be a needless trouble and expense. His word was once more taken, and he set off alone, to present himself for trial and certain condemnation. On the way he was overtaken in the woods by Mr. Edwards, a member of the council of Massachusetts, which at that time was the supreme executive of the state. This gentleman asked him whether he was going? 'To Springfield, sir,' was his answer, 'to be tried for my life.' To this casual interview Jackson owed his escape, when, having been found guilty and condemned to death, application was made to the council for mercy. The evidence and the sentence were stated, and the president put the question whether a pardon should be granted. It was opposed by the first speaker: the case, he said, was perfectly clear; the act was unquestionably high treason, and the proof complete; and if mercy was shown in this case, he saw no cause why it should not be granted in every other. Few governments have understood how just and politic it is to be merciful; this hard-hearted opinion accorded with the temper of the times, and was acquiesced in by one member after another, till it came to Mr. Edwards's turn to speak. Instead of delivering his opinion, he simply related the whole story of Jackson's singular demeanour, and what had passed between them in the woods. For the honour of Massachusetts and of human nature, not a man was found to weaken its effect by one of those dry legal remarks, which, like a blast in the desert, wither the heart they reach. The council began to hesitate, and when a member ventured to say that such a man certainly ought not to be sent to the gallows, a natural feeling of humanity and justice prevailed, and a pardon was immediately made out."

IN some unlucky dispositions, there is such an envious kind of pride, that they cannot endure that any but themselves should be set forth for excellent: so when they hear one justly praised, they will either seek to dismount his virtues: or, if they be like a clear night, eminent, they will stab him with a *but* of detraction: as if there were something yet so foul, as did obnubilate even his brightest glory. Thus when their tongue cannot justly condemn him, they will leave him in suspected ill, by silence. Surely, if we considered detraction to be bred of envy, nested only in deficient minds, we should find that the applauding of virtue would win us far more honour than the seeking slyly to disparage it. That would show we loved what we commended, while this tells the world we grudge at what we want in ourselves.—*Feltham's Resolves*.

THE ASCENT OF THE JUNGFRAU, ONE OF THE BERNESE ALPS.

THE JUNGFRAU AND THE RHINE AT SCHAFHAUSEN.

THE virgin mountain, wearing like a queen
A brilliant crown of everlasting snow,
Sheds ruin from her sides; and men below
Wonder that aught of aspect so serene
Can link with desolation. Smooth and green,
And seeming, at a little distance, slow,
The waters of the Rhine; but on they go,
Fretting and whitening, keener and more keen,

Till madness seizes on the whole wide flood,
Turned to a fearful thing, whose nostrils breathe
Blasts of tempestuous smoke, with which he tries
To hide himself, but only magnifies:
And doth in more conspicuous foment writhe,
Deafening the region in his "ireful mood."

Wordsworth.

THE most celebrated mountain of the Bernese
Alps is the JUNGFRAU, or *the Virgin*, so called either
from the unsullied purity of the snow which covers
it, or because, till lately, its crest had never been

reached by human foot. It has now lost its claim to the title on the latter score, the highest peak having been attained by two brothers named Meyer, of Aarau, in 1812; by a guide in 1823; and in 1841 by a party of scientific men, who had been residing among the glaciers of the Aar, for the purpose of making meteorological and geological observations.

The Jungfrau is the first mountain that the children of the country learn to call by name; and strangers arriving at Berne inquire for it as for the principal object of curiosity. With its vast expanse of snow and glacier, it is indeed a magnificent spectacle. Not only its summit, but all the mass of the mountain above the level of the spectator, is white with perpetual snow, of virgin purity, which breaks off abruptly at the edge of a precipice, forming one side of a ravine separating the Jungfrau from the Wengern Alp. It appears to be within gun-shot of the spectator; so colossal are its proportions, that the effect of distance is lost. Planted on the brow of a ravine is a chalet 5,350 feet above the sea-level, directly facing the Jungfrau, and presenting the best view of it. The opposite precipice, forming the base of the mountain, is channelled with furrows or grooves, down which avalanches frequently descend: they are most numerous a little after noon, when the sun's influence loosens masses of ice from the glacier, and causes them to break off.

A distant roar, as of thunder, announces the fall of an avalanche, and in half a minute a gush of white powder, resembling a small cataract, is perceived issuing out of one of the upper grooves or gullies; it then sinks into a fissure, and is lost for a time, but reappears some hundred feet below with another roar, and a fresh gush from a lower gully, till the mass of ice, reaching the lowest step, is precipitated into the gulf below. By watching attentively the sloping white side of the Jungfrau, the mass of glacier which produces this roar may be seen at the moment when disengaged, and before the sound reaches the ear; sometimes it merely slides down over the surface, at other times it turns over in a cake; but, in an instant after, it disappears, is shattered to atoms, and, in passing through the different gullies, is ground to powder so fine, that as it issues from the lowest, it looks like a handful of meal; and particles, reduced by friction to the consistence of dust, rise in a cloud of vapour. Independently of the sound, which is an awful interruption of the silence usually prevailing on the high Alps, there is nothing grand or striking in this phenomenon; and, indeed, it is difficult at first to believe that these echoing thunders arise from so apparently slight a cause, or that that cloud of dust arises from tons of ice hurled down the mountain, which would be capable of sweeping away whole forests, did any occur in its course, and of overwhelming houses and villages. During the early part of the summer, three or four such discharges may be seen in an hour: in cold weather they are less numerous; and in the autumn scarcely any occur. The avalanches finally descend into the valley of Trumlaten, the deep and uninhabited ravine which divides the Jungfrau from the Wengern Alp; and on melting, send forth a stream which falls into the Lutschine, a little above Lauterbrunnen.

Such is the mountain which the scientific party before alluded to proposed to scale. They had

met at the hospice of Grimsel, intending to sup together for the last time, when it was proposed that they should make one more excursion before they separated. The autumnal season was favourable to their plans, and it was soon decided to attempt the ascent of the Jungfrau, first crossing the Mer de Glace of Viesch.

Having fixed upon a guide, Jacob Leuthold by name, a man of known skill and fidelity, preparations were made during the evening; provisions, consisting of wine, cheese, meat, and a huge quantity of bread, were collected, while each one prepared his package, taking care to exclude every thing not absolutely necessary. The next morning, the 24th August, the weather becoming rainy and stormy, Jacob declined to set out. The weather did not improve during two days, so that it was the morning of the 27th before the party started on their expedition. They were twelve in number, namely, M. Agassiz, the distinguished ichthyologist; Mr. Forbes, professor of natural philosophy at Edinburgh; Mr. Heath, professor of mathematics at Cambridge; M. du Châtelier; M. de Pury; and M. Desor. There were also six guides, at the head of whom was Jacob, who was also appointed captain of the expedition.

Before the commencement of the journey, a circumstance occurred which serves to illustrate the character of the mountaineer guides, and to explain the unlimited confidence which travellers are wont to repose in them.

Johannes Wœhren, the inseparable friend of Jacob, and one of the most intelligent among all the guides of the hospice, happened, the day before the intended departure of the expedition, to be seized with a violent inflammation in the knee, which a medical man pronounced to be serious. He had long pleased himself with the prospect of conducting the party to the Jungfrau, for he and Jacob were the only individuals who were in the secret of this expedition. In spite of the pain he was suffering, the poor fellow still hoped it would turn out nothing; and the party felt great grief in telling him that he must no longer think of the Jungfrau. During the two days that the party was detained on account of the weather, Wœhren's knee became much better, so much so that, on the evening before they set out, he came limping to them with the assurance that he could go, having no doubt that he would be quite well on the morrow. M. Agassiz, as may be supposed, refused his consent, pointing out to him all the dangers to which he would be exposed. The unfortunate Wœhren could object nothing to these reasons; but the greatest sorrow was depicted on his countenance, and he retired to a corner of the apartment, where he continued sobbing, while his comrades were making preparations for departure. Next day, one of the party having occasion to enter the servants' apartment, was surprised to observe Wœhren at breakfast with the other guides. Surprise being expressed at this, he inquired if he was not to be permitted to bid them adieu. The party thanked him for his attention, again recommended him to be careful of his knee, and then set out. They had not proceeded far, when, on suddenly turning round a rock, he was seen with the other guides. Every one immediately called out to him, asking if he had really lost his senses. The party endeavoured to persuade him to abandon an undertaking which they believed would be

fatal to him; but his only reply was, that he had reflected on the dangers he ran, and that he would rather die than not be of the party. He was therefore allowed to proceed, with the recommendation to be prudent.

In two hours they reached the extremity of the Oberaar glacier, and paid a visit to the hut of a shepherd, which was wretched enough; it was a mere kennel, composed of four walls, and a stone roof, through which the wind blew without mercy. The shepherd was a poor little boy of twelve years old; ill clothed, sickly in appearance, weak in limb, and stupid in expression. Provisions for three months had been sent to him from Valais, consisting of black bread, almost as hard as the stones of his hut, and a little dried-up cheese.

At ten o'clock the party arrived at the summit of the Col de l'Oberaar, after crossing with great difficulty numerous fissures covered only with a frail bridge of snow. The thermometer indicated 35° Fahr. The summit of the Col is 10,023 feet above the level of the sea: it is about 100 feet broad, and is enclosed between two large peaks, the highest of which on the north is the Oberaar horn. The party spent a quarter of an hour contemplating the view commanded by this elevated point; gazing on the multitude of gigantic peaks which rose on all sides, some of them like huge gothic spires, others resembling immense cupolas covered with snow.

From this Col the party descended to the plateau of snow which feeds the glacier of Viesch. It is a vast circus of more than half a league in diameter, in the centre of which they halted for dinner,—a dinner as frugal as it well could be, but which was nevertheless delicious, thanks to the seasoning of a good appetite. While thus engaged, thick mists rose on the right, and the instruments seemed to agree in presaging rain. This made the party resolve to descend to the châteaux of Mæril, even though, by so doing, some leagues would be added to the next day's journey. They, therefore, descended the fields of snow, which extend southwards towards the Valais. The surface was smooth, the crevices had almost entirely disappeared, or, if any were still to be seen, they were on the sides of the valley, never extending so far as the place over which our travellers were walking. "We were thus advancing in perfect serenity," says M. Desor, the narrator of the expedition, "when we remarked, at some distance from us, many small openings. Curious to know the cause, we turned aside to examine them, but what was our surprise, when, on looking into one of these sky-lights, which was not more than three inches broad, by a foot long, we saw that it concealed an immense precipice, and in this precipice an azure light prevailed, which surpassed in beauty, transparency, and softness, all that we had hitherto seen among glaciers! What a pity that I have not the power of reproducing, in language worthy of the subject, all the poetry that was embodied in this simple combination of light and snow! Never had I seen a more attractive spectacle; our eyes were so fascinated by it, that we did not at first perceive that the crust of snow which covered this enchanted cavern did not exceed in this place a few inches; I do not, however, think that we ran very great danger, for the snow was very compact, and the sun had not softened it that day. After contemplating the attractive effect of this unique phenomenon, we

were desirous likewise to become acquainted with its nature and cause. It was an immense fissure of more than 100 feet in width, and of a depth varying from 100 to 300 feet. At the place from which we examined it, it had no other opening but the small loop-hole of which I have spoken; but farther on it corresponded to a large crevice, open near the right bank, by which the light entered, and the intermediate roof, by tempering the reflection of the snow walls, gave them an indescribable mildness and beauty."

After proceeding for nearly an hour along the fields of snow, the party entered upon the *névé*. As walking upon the latter is much easier than on the snow, it is usually the part of the glacier preferred to every other. That of Viesch was remarkable, when our travellers passed over it, for the quantity of red snow which it contained, and which, at a distance, imparted to it a rose-coloured reflection. As the minute organisms which compose red snow are usually accumulated in greatest numbers some lines below the surface, they were rendered more apparent by trampling upon them; and each step taken left as it were a bloody mark, which the eye could follow to a great distance.

The increasing elevation soon became apparent by the appearance of needles of ice; and soon the glacier of Viesch began to assume that irregular appearance, which gives it the character of being one of the most varied in the Valais. On the right side of this glacier the most difficult passage was encountered. The party had to descend a wall of rock nearly vertical and very high, at the foot of which fell a beautiful cascade. The path was a kind of opening, which presented here and there some slight projections on which the foot rested. When these points of support were insufficient, the passenger was obliged to cling in the best way he could against the walls of the opening, assisting himself with his pole, which is always ready to lean upon; or he was forced to call for the help of one of the guides—a step, however, which his self-love made him unwilling to adopt. It appears that this dangerous path is really the only way to the upper pastures, and that the shepherds hoist up the sheep by means of ropes tied to the horns, or, when these are wanting, round the neck. The shepherds themselves do not at other times often pass this way; for, when the sheep are once over it, they are left to themselves till the autumn, and are only visited by a shepherd from time to time, for the purpose of supplying them with salt.

The party continued to travel towards their resting-place for the night, and arrived, about six o'clock, at the cottages of Mæril, where the shepherds received them cordially, and promised to supply them with the best they could afford. These châteaux are situated in a little valley at an elevation of about 6,000 feet, and, although not very comfortable, they are of great utility to naturalists. They occupy a central point in the midst of the glaciers, whence researches can be made in any direction. From this point the party were to commence their journey to the Jungfrau, when an unforeseen circumstance had nearly thwarted their designs. "In order to attempt such an ascent, a ladder was indispensable; we had not brought one with us, because Jacob, who accompanied M. Hugi in 1832, had left the one he then used near the great fissure. He had not the least doubt that he would find it again nine years afterwards in the same spot

where he left it. What, therefore, was his surprise, when he learnt from a shepherd that his ladder had been carried away some years before by a peasant of Viesch! He instantly despatched a messenger to the village to demand back his ladder, but the detainer refused to restore it, alleging that it was now his property, because he had had it repaired. Let any one conceive our disappointment, when, at midnight, our delegate returned empty-handed! What were we now to do? Were we to delay our journey for another day? That would have been to sin against our star which visibly protected us, for all the mists of the previous evening were dispersed, and there was not a cloud in the sky. Should we attempt the ascent without a ladder? Jacob assured us that was altogether impossible. Not knowing what plan to adopt, we decided on sending off a second messenger to this refractory personage, to intimate to him that if he did not instantly restore our property, we would come down in a body to Viesch, to do ourselves justice. This second messenger left us at midnight, promising to execute our orders promptly. At four o'clock in the morning every one was awake, waiting with anxiety for the messenger, who failed to appear; five o'clock approached, and he had not returned, and still the sky continued as clear as at midnight. At last we saw him approaching with the ladder on his back. A cry of joy resounded through the air, and in an instant every one was prepared for starting."

The party then advanced to the Lake Mæril, from the margin of which they ascended to the glacier of Aletsch. At a place where the glacier bends, a magnificent view was obtained in two directions, in one of which the Jungfrau stood out grandly, and seemed to invite to perseverance.

"Who first beholds those everlasting clouds—
Those mighty hills, so shadowy, so sublime,
As rather to belong to heaven than earth—
But instantly receives into his soul
A sense, a feeling that he loses not—
A something that informs him 'tis an hour
Whence he may date henceforward and for ever."
Rogers.

From the place where the party mounted the glacier, to the point where the ascent becomes steep, the distance is reckoned to be six leagues, but this was traversed in less than four hours. At half-past nine they arrived at the snow-fields, which commence with the ascent. Here the party halted at a place which they named "The Repose," because the passage they had made, and the immense heights which rose in stages in front of them, seemed naturally to invite to rest and refreshment.

The Repose is described as one of the most beautiful situations on a glacier that can possibly be met with. It faces an immense amphitheatre, in which five great confluent branches of the glacier of the Aletsch become confounded with each other. Two of the most considerable of these occupy the background; they descend, one from the sides of the Jungfrau, and the other from the summit of Mönch. The three others are more lateral. The Mönch on the right, and the Jungfrau on the left, are in some measure the two columns of the great amphitheatre, which in this place separates the Swiss plain from the Valais. To the west of "The Repose" a vast hollow extended downwards between the Jungfrau and Kranzberg, and in this

was distinguished a series of terraces rising one above another, by which the ascent was to be made.

Leaving the party for a time at this convenient halting-place, we reserve for another occasion the account of the more perilous part of their journey.

SCENERY OF THE GREAT WESTERN RAILWAY.

No. II.

THE Slough Station is the next first-class to Paddington, from which it is distant eighteen miles. It is one of the most important points on the Railway; for, besides the population of Windsor and Eton, the influx of visitors to Windsor Castle is very great. Her Majesty, the Court, and attendants, also continually pass to and from London; and in the Station are two reception-rooms, very handsomely furnished, for the Queen's use. The building is very spacious; all the trains stop here, and stand under a covered shed, removed from the main line; the whole station being upon its south side. In the court-yard is a vast hotel, most superbly furnished, in most cases from the state-rooms of Louis XIV. and XV.; the principal bed-chamber is hung with Gobelin tapestry from Versailles, and the fittings are mostly in right royal taste, presenting accommodation of the most luxurious class.

Windsor has been the residence of the sovereign since the Conquest; but the ancient palace was at Old Windsor, on the mead. The mound occupied by the round tower of the present castle was, no doubt, William's work, but no traces of his masonry remain. Henry I. rebuilt the castle. Edward III. was born here. In 1359, he began to pull down the old structure, and, under the direction of William of Wykeham, rebuilt it upon a more ample plan. To this period is due the round tower; and "the general plan of the castle, its concentric defences, its flanking towers, and heavy gateways," says the author of the folio History before us, "are all manifestly Edwardian." The chapel of St. George was built by Edward IV. and the Seventh and Eighth Henries; and the tomb-house is the addition of Wolsey. Rickman pronounces the chapel to be one of the finest perpendicular buildings in the kingdom. "Henry VII." says the History, "added to the castle a pile of buildings in the upper ward, next the royal lodgings; Henry VIII. rebuilt the great gate of the lower ward. Edward VI. brought a supply of water from Blackmore Park, in Winkfield. Elizabeth made the celebrated north terrace; and Charles I. and II. augmented the royal lodgings." One of Charles the Second's improvements was to lengthen the terrace to 1870 feet, thus making it the noblest walk in Europe. Various alterations were made by succeeding princes, down to our own time, when, about the year 1804, George III. took up his residence here; though the good king and his family had lived at Windsor in a lath-and-plaster lodge thirty years before it occurred to him to inhabit his own castle. The great restoration was, however, commenced by George IV. in 1824, under Sir Jeffrey Wyattville. In 1828, the king removed to the private apartments on the south side of the castle. The entire work was not completed until the reign of his successor, William IV. It has cost the country upwards of a million, but no expenditure of the public money has been more satisfactory. The style of the building is old, while the material is new; and the harmony of

parts is so complete as to form a whole of almost inexpressible massiveness and grandeur. The most prominent addition in the view from the Railway is the keep, or round tower, heightened by some thirty feet; and, as says the poet Bowles,—“most imposing is its distant view, when the broad banner floats, or sleeps, in the sunshine amidst the intense blue of the summer skies; whilst its picturesque and ancient architectural vastness harmonizes with the decaying and gnarled oaks, coeval with so many departed monarchs.” Von Raumer, on his visit in 1835, acknowledged Windsor to have made a greater impression on him than all the other castles he had ever seen put together. This is high praise from a native of Germany, where feudalism has left so many stately monuments of its frowning glory. “Windsor,” says the acute critic, “combines the originality of the middle ages with the highest pitch of splendour and comfort which our times can reach. It is not an empty, tedious, monotonous repetition of the same sort of rooms over and over again; but every staircase, every gallery, every room, every hall, nay, every window, is different, surprising, peculiar; in one word, poetical. . . . In Windsor, England’s history—so rich with recollections—suddenly stands before my eyes. There are gigantic towers, bastions, chapels, churches, and knightly halls, in fresh and boundless variety; at every step, new views over rivers, valleys, woods, and fields; the fancies of a thousand years crowded together into one instant.”

We remember to have seen the Castle under very effective circumstances—on a dark night during the visit of the King of the French, in 1844—when a flood of light streamed through the principal windows in the northern front, protracted through the entire eastern side; it was, even from without, a scene of right regal hospitality, carrying the mind’s eye back to the chivalric glories of the feudal age in which the palace was built, and assuring us that, in the long vista of centuries, Windsor has not lost a ray of its splendour and magnificence.

To the public, the Castle has lately acquired an additional interest, from their free admission to inspect its interior; and so far has their recreation been studied, that a catalogue of its treasures has been prepared at the instance of the Prince Consort, and is sold to the masses at a merely nominal price. And there cannot be a more gratifying or beneficial sight for a monarchy-loving people than to see their sovereign mingling with crowds of her loving subjects, beneath her own palace-windows, and their children following the very foot-marks of royalty: such a scene of harmony may often be witnessed on the terraces of majestic Windsor. The view from the round tower, unequalled for richness of scenery, will impress the beholder with the secret of the nation’s greatness, as he traces the fertilizing course of “Father Thames,” nowhere more beautiful than where he is seen

“——— To sweep
Round Windsor’s castled steep
His waters to the distant deep;
Now hid behind some rising mound,
Some swell of intervening ground,
Or woods, whose waving top betrays
The distant windings of his maze;
Now to one sheet of silver spread,
Now foaming in his narrowing bed;
As though some guardian goddess gave
Her brightness to the crystal wave.”

On the banks of the Thames, opposite to Windsor Castle, and between it and the Railway, lies Eton, with its ancient chapel, and group of venerable buildings composing the College; a scene tinged with the picturesque melancholy of the poet Gray:

“Ye distant spires, ye antique towers,
That crown the watery glade,
Where grateful science still adores
Her Henry’s holy shade;
And ye, that from the stately brow
Of Windsor’s heights the expanse below
Of grove, of lawn, of mead, survey;
Whose turf, whose shade, whose flowers among
Wanders the hoary Thames along
His silver-winding way!
Ah, happy hills! ah, pleasing shade!
Ah, fields beloved in vain!
Where once my careless childhood strayed,
A stranger yet to pain.”

Between Eton and the Railway, lies Slough, with its Norman church, the burial-place of Sir W. Herschel, the frame of whose forty-foot telescope may still be seen in his garden on the Windsor Road. The benefits of the Railway contact are evident in every direction; from the little road-side inn to the luxurious villa. A geological fact of interest is thus recorded in the *Railway History*: “The section of a well at Slough gives of gravel sixteen feet, yellow clay fifteen and a-half feet, wet sand thirty-two feet, mottled clay eleven feet; total, seventy-four and a-half feet, at which depth the chalk and chalk-flints were reached, and a plentiful supply of good water rose to the level of the rails. This is the first indication of the chalk formation here covered up by the plastic clay.”

The *Electric Telegraph* has been for some time laid down upon the Railway: it was at first laid between London and Drayton, a distance of thirteen miles; and it has lately been completed to Slough, with a view to a still further extension to Buckingham Palace at the one end, and to Windsor Castle at the other. This is the invention patented by Mr. Cooke and Mr. Wheatstone: it consists generally of a number of wires, suspended separately in the air by a series of upright standards of cast-iron, varying from ten to twenty-five feet in height, and placed sometimes as much as one hundred and fifty yards apart. These wires communicate with the different stations, at each of which is a small machine, by means of which a galvanic battery is put in action, and signals are read off upon a dial, or given by pressing upon keys, resembling in appearance those of a piano-forte. As the velocity of the electric fluid, when travelling along a good conductor, is estimated at about 200,000 miles per second, the transmission of signals is practically instantaneous; and the conversation, by means of keys, may be carried on by an experienced person almost as rapidly as a familiar piece of music could be played.

The Electric Telegraph is worked at Slough in a small wood-built station, placed upon a slight eminence, to which there are steps of ascent; and the Telegraph in action may here be inspected at the exhibition charge of a shilling. By aid of the marvellous power of this triumph of science, the event of Her Majesty’s accouchement at Windsor Castle, Aug. 6, 1844, was communicated from Slough to Paddington, and an acknowledgment of the message returned to Slough within eleven minutes!

We must spare room for a few other performances of this Telegraph. Thus, in January 1845, the flight of Tawell, then suspected of murder, was communicated from Slough after he had left that station by a train; the intelligence was received at Paddington, and acknowledged, long before Tawell’s arrival there; and thus he was followed by the police, and eventually captured! The vast importance of this application of the Telegraph produced in the public mind a startling conviction of its utility to the welfare of society. By this Telegraph, too, has been accomplished the apparent paradox of sending a message in the year 1845, and receiving it in the year 1844! Thus, directly after the clock had struck twelve on the night of the 31st of December, the Superintendent at Paddington signalled his brother at Slough that he wished him a

happy new year; an answer was instantly returned, suggesting that the wish was premature, as the year had not yet arrived at Slough!

Upon leaving Slough, the Railway is seen to have approached nearly to the boundary of the Thames, and to run at the foot of a well-wooded range, forming the rising ground upon the north. On the summit of the hill above the Station is seen the cupola of Stoke Pogis House, not far from the site of the mansion built by the Earls of Huntingdon, in the reign of Elizabeth, and celebrated by Gray, in his "Long Story":

"In Britain's Isle—no matter where—
An ancient pile of building stands:
The Huntingdons and Iltons there
Employ'd the power of fairy hands."

The estate is now possessed by Mr. Penn, a descendant of Penn, of Pennsylvania, and representative of the old stock of Penn, of Penn, in this county. In the park is the memorial to Gray, erected by Mr. Penn; and the spire of Stoke Church may be seen rising from massy foliage, and the "Church-yard" of Gray's "Elegy." But the village church, and park, with Eton and its College, are all eulogized in Gray's verse; and it is scarcely possible to point to a locality which is more closely identified in lyric poetry than are Stoke and Eton.

There is, however, still another memorial to be noticed in this poetic region—the "Mons," or Mount, whence the famed festival of the "Montem," or "Ad Montem," derives its name. It is celebrated triennially; next year will be its enactment, the last "Montem" having been 'in 1844, when it was a strange anomaly to see the Etonians, in their superb costumes of centuries since, collecting "salt" of the railway passengers: it was bringing the past and present into very suggestive association. D'Israeli, by the way, has given us a charming picture of the Montem, in his very characteristic novel of "*Coningsby*."

Just west of Stoke lies Farnham Royal, which is held of the crown by one of those feudal tenures which carry us back to the most picturesque age of our history; the possession being by the service of supporting the king's right arm, and providing a glove for his right hand, when holding the royal sceptre at a coronation. A little below Farnham is Balleis, a quadrangular brick mansion, once the residence of the polite Earl of Chesterfield. The *Railway History*, too, notes: "Burnham, the next parish, gives name to a hundred and deanery. An abbey of Benedictine nuns, founded here in 1165, was dissolved at the Reformation. The church is large, and contains some irregular perpendicular windows. In it hangs an escutcheon of Hastings of Woodlands, with the hundred quarterings of that illustrious race."

On the south side of the Railway, between Slough and Taplow, the country lies open to the Thames. The Taplow or Maidenhead Station, twenty-two and a-half miles from London, marks the point to which the Railway first opened in June, 1838; it lies here upon an embankment, crosses the Great Western turnpike road by an oblique brick bridge, and we soon reach the Maidenhead bridge.

This celebrated bridge is composed of a central pier and two main arches, flanked at either end by four smaller openings; it is of brick, finished with stone. The Maidenhead bridge is peculiar, inasmuch as it consists of two arches only, each 130 feet span and 24 feet rise, which are probably the largest, and are certainly the flattest in proportion to their span, yet executed in brick. The reason of its construction with two arches instead of a greater number, was the existence of a shoal, affording an excellent foundation for the pier, in the middle of the river; and the necessity of leaving the sides and deeper parts of the stream open for the navigation. "The latter cause on the one hand," states the *History*, "combined with the importance of preserving uniform the gradients of the Railway on the other,

governed also the height of the arches." As this bridge was a novelty in engineering, its failure was pretty generally predicted; and some bad cement being used in the construction, the northern arch proved faulty, was condemned by the engineer, taken down, and rebuilt. The southern arch, however, remains as it was originally built; and the entire bridge, since the removal of the centerings, has stood with less than the ordinary amount of settlement. The view from this fine work is very charming; in the distance the hanging woods of Taplow and Cliefden,

"With their beechen wreaths, the king of rivers crowning,"

ascend from the margin of the stream, and terminate in the imposing façade of Cliefden House. The view in the opposite direction commands the river,

"——— Flowing,
To Windsor-ward again,"

and extends over St. Leonard's and the Castle, including much of the park. The old Maidenhead bridge lies at a short distance; it is a many-arched structure, which loses much in contrast with the very bold railway work.

Next Maidenhead lies Bray, famed for its ancient manor-house at Ockholt, which the Abingdon family have suffered to fall into ruin. The parish church of Bray stands near the Thames, and is seen near the Railway: it has a fine lofty tower, and some good transition windows; though the church is more popular in association with "the Vicar of Bray," who has been cited as a political turncoat, from the reign of Henry VI., when, according to Fuller, this "vivacious vicar" lived. In four reigns he was, first a Papist, then a Protestant, then a Papist, then a Protestant. "The vicar," says quaint old Fuller, "being taxed by one for being a turncoat, 'Not so,' said he, 'for I always kept my principles, which is this: to live and die Vicar of Bray.'"

North of the Railway lies Bysham, once a Preceptory of the Temple. It had, too, a fine monastery, in the church of which were buried many of the Montacute and Neville families, including the king-maker Warwick. All the monumental glories of its illustrious dead were swept away after the Dissolution, and even the site of the abbey-church cannot with certainty be traced. An early English doorway, and a few other fragments of the abbey, are built into the modern mansion named Bysham Abbey.

The Railway remains for some distance upon a high chalk embankment, crossing the roads between Bray and Maidenhead upon a series of very lofty bridges. The Twyford Station, thirty-three and three-quarter miles from London, is timber-built; thence the line crosses

"The Loddon slow, with verdant alders crowned."

This stream occupies two principal channels, here both fordable; a circumstance which has given its name to the village. About two miles below, the Loddon, "the fair Lodona called," falls into the Thames; according to Drayton,

"——— Contributing her store,

As still we see the much runs ever to the more."

The Railway cutting next west that of Loddon, is that of Sonning, nearly two miles long, and varying from twenty to sixty feet deep. At the latter depth, "the top breadth, at the slope of one foot horizontal for two-thirds of a foot perpendicular, is 220 feet. One of the objections brought against the Great Western gauge was the increased amount of the earth-work required, which was stated to be as seven to five, or as the difference between the new and the old gauge. The cross section of the deepest part of this cutting, allowing a width of thirty feet for the railway, and ten feet for the side drains, gives 867 cubic yards of excavation for each yard in length; had the gauge of the Railway been, instead of seven, of the old width of five feet, allowing

a width of twenty-three feet for the railway, and ten feet, as before, for the drains, the earth-work for each yard in length would have been 820 yards; the difference being only about forty-seven cube yards, or as 867 to 820."—(*History of the Railway*.) At its deepest part this cutting is crossed by two bridges, one of which carries the Great Western turnpike-road from London towards Reading.

On leaving the Sonning cutting, the Railway enters once more the valley of the Thames, at a point where

"— Clear Kennet overtakes
His lord, the stately Thames,"

and traverses the rich alluvial meads of Reading.

The Reading Station, thirty-five and three-quarter miles from London, is in plan like that at Slough; and you are soon reminded that you have reached a place of importance. Reading is the flourishing county-town of Berkshire; and, within the present century, has doubled its population, the number in 1801 being 9,742, and in 1841, 19,528. It is a borough, returning two members to Parliament; one of whom, Mr. Charles Russell, is also Chairman of the Great Western Railway Company. The town appears to be of Saxon origin, and its possession was much contested by the Saxons and Danes in the ninth and tenth centuries. It had also a Norman castle, destroyed in 1153. A mitred Abbey of Benedictines was founded here by Henry I. in 1121, and the church was consecrated by Becket in 1164. Within its walls were buried the founder, and his queen Adeliza; and probably their daughter Maud, the wife of the Emperor Henry IV., and mother of Henry II. of England. Her epitaph, recorded by Camden, has been deservedly admired:

"Magna orto, majorque viro, sed maxima partu;
Hic jacet Henrica hinc, sponsa, parens."

Within the abbey, parliaments were convened, from the twelfth to the fifteenth centuries. At the Dissolution by Henry VIII., its revenues were equal to 20,000*l.* per annum, present money; and from thence to the reign of Charles I. the Abbey was a royal residence. In 1642, the town was fortified by the parliament, taken by the king, and retaken from Sir Arthur Aston by Essex; whose entrenchments may still be traced across the valley. In 1688, the only officer who fell in the Revolution, was slain in a skirmish with James's troops at Reading. The eminent prosperity of the borough was, in the main, the wealth of its abbey; but, as early as the reign of Edward I., it was famous for its cloth-manufacture: this was destroyed in the Civil Wars; but Reading still remains a great mart for corn and agricultural produce. The extension of the Thames navigation to Oxford has likewise contributed to its prosperity; as did, also, the conversion of the Kennet into a navigable canal as high as Newbury in 1716; although, in the short-sighted spirit of the times, that "innovation" was loudly protested against. The railway has, unquestionably, proved a great benefit to the town; and the public spirit of its inhabitants partakes largely of the characteristic intelligence of the age. Of the ancient glory of the abbey, but a few walls, or a ragged, broken skeleton, remain; though, in recent excavations, the plan of the building has been traced; and, says the *Railway History*, there "have been brought to the surface, from the neighbourhood of the high altar, the relics of kings, and warriors, and holy men, the fathers and founders of a church, which they probably trusted would have confined their bones till doomsday." In the last remains of a Franciscan monastery, in the town, is preserved a very fine decorated window. There are, also, several ancient parish churches; and the love of ancient art at Reading is shown in the new buildings—for example, in the large gaol, in the old English style, which nearly faces the Railway station, and in a restored chapel adjoining. Near Reading resides Miss Mitford, who has drawn a

delightful picture of the borough, under the name of "Belford Regia."

From Reading may be seen the fine domain of Caversham Park, on the Oxfordshire bank of the Thames. It was, till lately, a seat of the Cadogan family, who were formerly Barons of Reading. At Caversham lived the wittiest of English divines, Dr. South.

The Railway leaves the Reading Station as it arrived there, upon embankment, and then passes into cuttings, one of which divides Purley Park into two parts. The mansion, Purley Hall, sometimes mistaken for Horne Tooke's "Purley" was built for Law, of South Sea notoriety; and Warren Hastings resided here during his memorable trial. The Railway here lies close to the south bank of the Thames, and commands a fine view of the woods and Elizabethan house of Maple-Durham, the ancient seat of the Blounts.

From the Purley cutting the line is carried over an embankment, to the village and Station of Pangbourne, forty-one miles and a-quarter from London. The Station is, generally, Elizabethan, broad-eaved, and not unpicturesque. Pangbourne is named from its fine trout stream, the Pang; it is a pretty village, upon the Reading and Oxford road, which is crossed by the Railway close to the station, upon an oblique red brick bridge. Opposite Pangbourne, on the Thames, lies Whitechurch, noticeable for its church of good Norman work, and perpendicular and decorated windows.

"The Railway," says our complete *History*, "now fairly lies within the ravine of the Thames," passing into the Shooter's Hill cutting, under Basilidon Park, the finely-wooded estate of Mr. Morison, M.P., who has lately proposed some very salutary legislative enactments for the better management of railways. Mr. Morison has realized a large fortune as a warehouseman in Fore-street, Cripplegate; and, some years since, became the purchaser of Fonthill Abbey. The mansion at Basilidon is in the classic style of the last century; its festal capabilities were lately put in requisition, when Mr. Morison entertained, in most sumptuous style, the Lord Mayor, and a large party of the corporation of London, on their "View of the Thames." Basilidon church has a beautiful chancel, and is a valuable example of the Early Decorated style. During the railway construction, there were found in a field two skeletons, and the foundation of a Roman villa, with a tessellated pavement; the latter has been carefully preserved.

At Basilidon, (says our illustrated guide,) the source of the Thames bends considerably to the west, and approaches to the foot of the chalk range. In consequence of this, the Railway crosses the river into Oxfordshire, at Basilidon, and recrosses it about two miles further on, at Moulsoford, by means of two nearly similar bridges of red-brick, with Bath stone finishings, and each composed of four elliptical arches, of sixty two feet span. The Thames valley only presents the character of a ravine between Pangbourne and Stratley, which lies upon the Berkshire bank of the river, upon a sort of shelf or platform between it and the steep escarpment of the chalk. The village lies on the Roman road, called Ickle-ton-street, which, here descending the hill, crosses the Thames by a ford; hence, the name compounded of "street," or way, and the "ey," or island, still seen in the middle of the river. The Railway labourers have met with several indications of Roman occupation in this locality; a vase of coarse pottery, found at Basilidon, is entitled to special mention. The church is in the Transition style, from Norman towards Early English.

Opposite Stratley lies Goring Station, forty-four and a half miles from London; it has a church, mostly Norman; and from thence the line passes in cutting to Moulsoford. We may here quote a specimen of the admirable geological description of the *History*:—"The valley now opens rapidly; the high ground on the left passes off westward, to form the lley Downs, and that on the right recedes almost at a right angle, under the name of the Chilterns. The space between them is the

lower end of the great vale of Berks, and is moulded into a number of low, undulating hills, composed of grey or chalk marle, and forming the sub-escarpment of the great crest of the chalk; this marle throws out the waters which have percolated through the chalk, and the junction between the two is marked by a line of springs, indicated by such names as Brightwell, Jutwell, Harwell, Mongewell, &c., and by a thick belt of population, attracted thither from a very early period by the fertility of the soil. The grey chalk, here full of fossils and pyrites, forms the embankment on which the Railway approaches Moulsoford Bridge; the subsoil, however, is covered up with a thick deposit of gravel, in which elephants' and sharks' teeth, and various diluvial remains, have been discovered." Moulsoford village lies in Berkshire, and its "ford" crosses the Thames to South Stoke, through which village the Railway passes; it has an Early English and Early Decorated church. From this part of the line may be seen, on the south, some of those curious terraces called "Linchetts," so common on the sides of chalk and oolite downs. Here, too, may be seen the spires of Wallingford, and the wooded dells of the Chilterns; and "a spur from the Isley Downs, crowned by Unwell Wood, well known to the Oxford botanists for its varieties of the Orchis tribe; as the Down is to sportsmen for the excellent coursing matches of Mr. Stone, the venerable squire of Streatley."

We have now reached the Wallingford Station, upon the Berkshire bank of the river, forty-seven and a half miles from London, and about three from Wallingford. The town is a "fine old place," still enclosed by the Roman earthworks, though the ford is superseded by a stone bridge. A lofty *agger*, defended on the exterior by a wet ditch, encloses the town, and forms three sides of a parallelogram, of which the Thames is the fourth. Wallingford was destroyed by the Danes in 1006, but rose again into prosperity; and Swein, their king, was born here in 1013. The Conqueror found the Saxon Wigod in possession of the "Vill," and married his heiress to Robert D'Oyley, who founded castles here and at Oxford. Wallingford castle was very strong, and its central position made it of great importance in the Barons' wars. In this stormy period, however, its strength had begun to decay; Leland, in the beginning of the sixteenth century, describes it as "sore yn ruine;" Camden, who wrote somewhat later, says that "its size and magnificence used to amaze me when I came hither, a lad from Oxford." Still, up to the Civil Wars, it was considered one of the most important fortresses in the king's possession: it was held by Charles until its surrender to Fairfax, in 1646; and it was finally destroyed, and the materials sold, by order of Cromwell, in 1652. The date of the fortress is, however, confirmed by its lofty Norman mound, inside which is a well; and there is a doorway of the same period. The castle inclosure is kept in order by its proprietor, Mr. Blackstone. The name of the town is ascribed either to an ancient British word, *guallen*, or the Latin, *vallum*, each signifying a fort, or fortified position, and the ford over the river, thus making *Guallen Ford* or *Vallum Ford*. Its fourteen churches, described by Leland, have dwindled to three, and the remains of a chapel in the castle. One of the former, St. Peter's, was rebuilt by Sir William Blackstone, who is buried there.

Leaving the Moulsoford Station, the Railway passes under the Oxford road, and by a deep cutting of chalk marle, enters Cholsey, famed for its Saxon monastery and Norman church, the latter one of the finest parochial buildings in the country. "The village," says the *History*, "stands upon a knoll of gravel, in great part surrounded by land liable to be flooded; hence its name of 'Cholsey, or Ceolsia, 'the island of Cæol,' who was, probably, its Saxon owner."

(To be concluded in next Number.)

THE CAPUCHIN.

FATHER CRISTOFORO of **** was a man nearer sixty than fifty years of age. His shaven head, circled with a narrow line of hair, like a crown, according to the fashion of the Capuchin tonsure, was raised from time to time with a movement that betrayed somewhat of disdain and disquietude, and then quickly sank again in thoughts of lowliness and humility. His long grey beard, covering his cheeks and chin, contrasted markedly with the prominent features of the upper part of his face, to which a long and habitual abstinence had rather given an air of gravity, than effaced the natural expression. His sunken eyes, usually bent on the ground, sometimes brightened up with a momentary fire, like two spirited horses, under the hand of a driver whom they know by experience they cannot overcome; yet occasionally they indulge in a few gambols and prancings, for which they are quickly repaid by a smart jerk of the bit.

Father Cristoforo had not always been thus: nor had he always been Cristoforo: his baptismal name was Lindovico. He was the son of a merchant of **** who, in his latter years, being considerably wealthy, and having only one son, had given up trade, and retired as an independent gentleman.

In his new state of idleness he began to entertain a great contempt for the time he had spent in making money, and being useful in the world. Full of this fancy, he used every endeavour to make others forget that he had been a merchant; in fact, he wished to forget it himself. But the warehouse, the bales, the journal, the measure, were for ever intruding upon his mind, like the shade of Banquo to Macbeth, even amidst the honours of the table and the smiles of flatterers. It is impossible to describe the care of these poor mortals to avoid every word that might appear like an allusion to the former condition of their patron. One day, to mention a single instance, towards the end of dinner, in the moment of liveliest and most unrestrained festivity, when it would be difficult to say which was merriest, the company who emptied the table, or the host who filled it, he was rallying with friendly superiority one of his guests, the most prodigious eater in the world. He, meaning to return the joke, with the frankness of a child, and without the least shade of malice, replied, "Ah, I'm listening like a merchant." The poor offender was at once conscious of the unfortunate word that had escaped his lips; he cast a diffident glance towards his patron's clouded face, and each would gladly have resumed his former expression; but it was

(1) This very striking sketch is taken from an excellent translation of Manzoni's "Betrothed," lately published by Mr. Burns, of Portman-street.

(2) "*Io faccio orecchie da mercante.*" A proverbial expression, meaning, "I pay no attention to you," which quite loses its point when translated into English.

impossible. The other guests occupied themselves, each in his own mind, in devising some plan of remedying the mistake, and making a diversion; but the silence thus occasioned only made the error more apparent. Each individual endeavoured to avoid meeting his companion's eye; each felt that all were occupied in the thought they wished to conceal. Cheerfulness and sociability had fled for that day, and the poor man, not so much imprudent as unfortunate, never again received an invitation. In this manner, Ludovico's father passed his latter years, continually subject to annoyances, and perpetually in dread of being despised; never reflecting that it was no more contemptuous to sell than to buy, and that the business of which he was now so much ashamed, had been carried on for many years before the public without regret. He gave his son an expensive education, according to the judgment of the times, and as far as he was permitted by the laws and customs of the country; he procured him masters in the different branches of literature and in exercises of horsemanship, and at last died, leaving the youth heir to a large fortune. Ludovico had acquired gentlemanly habits and feelings, and the flatterers by whom he had been surrounded had accustomed him to be treated with the greatest respect. But, when he endeavoured to mix with the first men of the city, he met with very different treatment to what he had been accustomed to, and he began to perceive that, if he would be admitted into their society, as he desired, he must learn, in a new school, to be patient and submissive, and every moment to be looked down upon and despised.

Such a mode of life accorded neither with the education of Ludovico, nor with his disposition; and he withdrew from it, highly piqued. Still he absented himself unwillingly; it appeared to him that these ought really to have been his companions, only he wanted them to be a little more tractable. With this mixture of dislike and inclination, not being able to make them his familiar associates, yet wishing in some way to be connected with them, he endeavoured to rival them in show and magnificence, thus purchasing for himself enmity, jealousy, and ridicule. His disposition, open and at the same time violent, had occasionally engaged him in more serious contentions. He had a natural and sincere horror of fraud and oppression—a horror rendered still more vivid by the rank of those whom he saw daily committing them—exactly the persons he hated. To appease, or to excite all these passions at once, he readily took the part of the weak and oppressed, assumed the office of arbitrator, and intermeddling in one dispute drew himself into others; so that by degrees he established his character as a protector of the oppressed, and a vindicator of injuries. The employment, however, was troublesome: and it need not be asked whether poor Ludovico met with enemies, untoward accidents, and vexations of spirit. Besides the external war he had to maintain, he was continually harassed by internal strifes; for, in order to carry out his undertakings, (not to speak of such as never were carried out,) he was often obliged to make use of subterfuges, and have recourse to violence, which his conscience could not approve. He was compelled to keep around him a great number of bravoes; and, as much for his own security as to ensure vigorous assistance, he had to choose the most daring, or, in other words, the most unprincipled, and thus to live with villains for the sake of justice. Yet, on more than one occasion, either discouraged by ill success, or disquieted by imminent danger, wearied by a state of constant defence, disgusted with his companions, and in apprehension of dissipating his property, which was daily drawn upon largely, either in a good cause, or in support of his bold enterprises,—more than once he had taken a fancy to turn friar; for in these times, this was the commonest way of escaping difficulties. This idea would probably have been only a fancy all his life, had it not been changed to a resolution by a more serious and terrible accident than he had yet met with.

He was walking one day along the streets, in company with a former shopkeeper, whom his father had raised to the office of steward, and was followed by two bravoes. The steward, whose name was Cristoforo, was about fifty years old, devoted from childhood to his master, whom he had known from his birth, and by whose wages and liberality he was himself supported, with his wife and eight children. Ludovico perceived a gentleman at a distance, an arrogant and overbearing man, whom he had never spoken to in his life, but his cordial enemy, to whom Ludovico heartily returned the hatred; for it is a singular advantage of this world, that men may hate and be hated without knowing each other. The Signor, followed by four bravoes, advanced haughtily, with a proud step, his head raised, and his mouth expressive of insolence and contempt. They both walked next to the wall, which (be it observed) was on Ludovico's right hand; and this, according to custom, gave him the right (how far people will go to pursue the right of a case!) of not moving from the said wall to give place to any one, to which custom, at that time, great importance was attached. The Signor, on the contrary, in virtue of another custom, held that this right ought to be conceded to him in consideration of his rank, and that it was Ludovico's part to give way. So that in this, as it happens in many other cases, two opposing customs clashed, the question of which was to have the preference remaining undecided, thus giving occasions of dispute, whenever one hard head chanced to come in contact with another of the same nature. The foes approached each other, both close to the wall, like two walking figures in bas relief, and on finding themselves face to face, the Signor, eyeing Ludovico with a haughty air and imperious frown, said, in a corresponding tone of voice, "Go to the outside."

"You go yourself," replied Ludovico; "the path is mine."

"With men of your rank the path is always mine."

"Yes, if the arrogance of men of your rank were a law for men of mine."

The two trains of attendants stood still, each behind its leader, fiercely regarding each other, with their hands on their daggers prepared for battle, while the passers-by stopped on their way, and withdrew into the road, placing themselves at a distance to observe the issue; the presence of these spectators continually animating the punctilio of the disputants.

"To the outside, vile mechanic! or I'll quickly teach you the civility you owe a gentleman."

"You lie: I am not vile."

"You lie, if you say I lie." This reply was pragmatical. "And if you were a gentleman, as I am," added the Signor, "I would prove with the sword that you are the liar."

"That is a capital pretext for dispensing with the trouble of maintaining the insolence of your words by your deeds."

"Throw this rascal in the mud," said the Signor, turning to his followers.

"We shall see," said Ludovico, immediately retiring a step, and laying his hand on his sword.

"Rash man!" cried the other, drawing his own, "I will break this when it is stained with your vile blood."

At these words they flew upon one another, the attendants of the two parties fighting in defence of their masters. The combat was unequal, both in number, and because Ludovico aimed rather at parrying the blows of, and disarming, his enemy, than killing him, while the Signor was resolved upon his foe's death at any cost. Ludovico had already received a blow from the dagger of one of the bravoes in his left arm, and a slight wound on his cheek, and his principal enemy was pressing on to make an end of him, when Cristoforo, seeing his master in extreme peril, went behind the Signor with his dagger, who, turning all his fury upon his new enemy, ran him through with his sword. At

this sight, Ludovico, as if beside himself, buried his own in the body of his provoker, and laid him at his feet, almost at the same moment as the unfortunate Cristoforo. The followers of the Signor, seeing him on the ground, immediately betook themselves to flight: those of Ludovico, wounded and beaten, having no longer any one to fight with, and not wishing to be mingled in the rapidly increasing multitude, fled the other way, and Ludovico was left alone in the midst of the crowd, with these two ill-fated companions lying at his feet.

"What's the matter?—There's one.—There are two.—They have pierced his body.—Who has been murdered?—That tyrant.—Oh, Holy Mary, what a confusion!—Seek, and you shall find.—One moment pays all.—So he is gone!—What a blow!—It must be a serious affair.—And this other poor fellow!—Mercy! what a sight!—Save him, save him!—It will go hard with him too.—See how he is mangled! he is covered with blood.—Escape, poor fellow, escape!—Take care you are not caught."

These words predominating over the confused tumult of the crowd, expressed their prevailing opinion, while assistance accompanied the advice. The scene had taken place near a Capuchin convent, an asylum in those days, as every one knows, impenetrable to bailiffs, and all that complication of persons and things which went by the name of justice. The wounded and almost senseless murderer was conducted, or rather carried by the crowd, and delivered to the monks with the recommendation, "He is a worthy man, who has made a proud tyrant cold; he was provoked to it, and did it in his own defence."

Ludovico had never before shed blood, and although homicide was in those times so common that every one was accustomed to hear of and witness it, yet the impression made on his mind by the sight of one man murdered *for* him, and another *by* him, was new and indescribable; a disclosure of sentiments before unknown. The fall of his enemy, the sudden alteration of the features, passing in a moment from a threatening and furious expression to the calm and solemn stillness of death, was a sight that instantly changed the feelings of the murderer. He was dragged to the convent almost without knowing where he was, or what they were doing to him; and, when his memory returned, he found himself on a bed in the infirmary, attended by a surgeon-triary, (for the Capuchins generally had one in each convent,) who was applying lint and bandages to the two wounds he had received in the contest. A father, whose special office it was to attend upon the dying, and who had frequently been called upon to exercise his duties in the street, was quickly summoned to the place of combat. He returned a few minutes afterwards, and, entering the infirmary, approached the bed where Ludovico lay. "Comfort yourself," said he, "he has at least died calmly, and has charged me to ask your pardon, and to convey his to you." These words aroused poor Ludovico, and awakened more vividly and distinctly the feelings which confusedly crowded upon his mind; sorrow for his friend, consternation and remorse for the blow that had escaped his hand, and, at the same time, a bitterly painful compassion for the man he had slain. "And the other?" anxiously demanded he of the friar.

"The other had expired when I arrived."

In the meanwhile, the gates and precincts of the convent swarmed with idle and inquisitive people; but, on the arrival of a body of constables, they dispersed the crowd, and placed themselves in ambush at a short distance from the doors, so that none might go out unobserved. A brother of the deceased, however, accompanied by two of his cousins and an aged uncle, came, armed *coup-à-piè*, with a powerful retinue of braves, and began to make the circuit of the convent, watching with looks and gestures of threatening contempt the idle by-standers, who did not dare say, "He is out of your reach," though they had it written on their faces.

As soon as Ludovico could collect his scattered thoughts, he asked for a Father Confessor, and begged that he would seek the widow of Cristoforo, ask forgiveness in his name for his having been the involuntary cause of her desolation, and at the same time assure her that he would undertake to provide for her destitute family. In reflecting on his own condition, the wish to become a friar, which he had often before revolved in his mind, revived with double force and earnestness; it seemed as if God himself, by bringing him to a convent just at this juncture, had put it in his way, and given him a sign of His will; and his resolution was taken. He therefore called the guardian, and told him of his intention. The superior replied, that he must beware of forming precipitate resolutions, but that if, on consideration, he persisted in his desire, he would not be refused. He then sent for a notary, and made an assignment of the whole of his property (which was no insignificant amount) to the family of Cristoforo, a certain sum to the widow, as if it were an entailed dowry, and the remainder to the children.

The resolution of Ludovico came very *à propos* for his hosts, who were in a sad dilemma on his account. To send him away from the convent, and thus expose him to justice, that is to say, to the vengeance of his enemies, was a course on which they would not for a moment bestow a thought. It would have been to give up their proper privileges, disgrace the convent in the eyes of the people, draw upon themselves the animadversions of all the Capuchins in the universe for suffering their common rights to be infringed upon, and arouse all the ecclesiastical authorities, who at that time considered themselves the lawful guardians of these rights. On the other hand, the kindred of the slain, powerful themselves, and strong in adherents, were prepared to take vengeance, and denounced as their enemy any one who should put an obstacle in their way. The history does not tell us that much grief was felt for the loss of the deceased, nor even that a single tear was shed over him by any of his relations: it merely says that they were all on fire to have the murderer, dead or living, in their power. But Ludovico's assuming the habit of a Capuchin settled all these difficulties; he made atonement in a manner, imposed a penance on himself, tacitly confessed himself in fault, and withdrew from the contest; he was, in fact, an enemy laying down his arms. The relatives of the dead could also, if they pleased, believe and make it their boast that he had turned friar in despair, and through dread of their vengeance. But, in any case, to oblige a man to relinquish his property, shave his head, and walk barefoot, to sleep on straw, and to live upon alms, was surely a punishment fully equivalent to the most heinous offence.

The Superior presented himself with an easy humility to the brother of the deceased, and, after a thousand protestations of respect for his most illustrious house, and of desire to comply with his wishes as far as was possible, he spoke of Ludovico's penitence, and the determination he had made, politely making it appear that his family ought to be *therewith* satisfied, and insinuating, yet more courteously, and with still greater dexterity, that whether he were pleased or not, so it would be. The brother fell into a rage, which the Capuchin patiently allowed to evaporate, occasionally remarking that he had too just cause of sorrow. The Signor also gave him to understand, that in any case his family had it in their power to enforce satisfaction, to which the Capuchin, whatever he might think, did not say no; and finally he asked, or rather required as a condition, that the murderer of his brother should immediately quit the city. The Capuchin, who had already determined upon such a course, replied that it should be as he wished, leaving the nobleman to believe, if he chose, that his compliance was an act of obedience; and thus the matter concluded to the satisfaction of all parties. The family were released from their obligation; the

friars had rescued a fellow-creature, and secured their own privileges, without making themselves enemies; the *dilettanti* in chivalry gladly saw the affair terminated in so laudable a manner; the populace rejoiced at a worthy man's escaping from danger, and at the same time marvelled at his conversion; finally, and above all, in the midst of his sorrow, it was a consolation to poor Ludovico himself, to enter upon a life of expiation, and devote himself to services, which, though they could not remedy, might at least make some atonement for his unhappy deed, and alleviate the intolerable pangs of remorse. The idea that his resolution might be attributed to fear pained him for a moment, but he quickly consoled himself by the remembrance that even this unjust imputation would be a punishment for him, and a means of expiation. Thus, at the age of thirty, Ludovico took the monastic habit, and being required, according to custom, to change his name, he chose one that would continually remind him of the fault he had to atone for—the name of Friar Cristoforo.

Scarcely was the ceremony of taking the religious habit completed, when the guardian told him that he must keep his novitiate at * * * sixty miles distant, and that he must leave the next day. The novice bowed respectfully, and requested a favour of him. "Allow me, Father," said he, "before I quit the city where I have shed the blood of a fellow-creature, and leave a family justly offended with me, to make what satisfaction I can, by at least confessing my sorrow, begging forgiveness of the brother of the deceased, and so removing, please God, the enmity he feels towards me." The guardian, thinking that such an act, besides being good in itself, would also serve still more to reconcile the family to the convent, instantly repaired to the offended Signor's house, and communicated to him Friar Cristoforo's request. The Signor, greatly surprised at so unexpected a proposal, felt a rising of anger, mingled perhaps with complacency, and, after thinking a moment, "Let him come to-morrow," said he, mentioning the hour; and the Superior returned to the monastery to acquaint the novice with the desired permission.

The gentleman soon remembered that the more solemn and notorious the submission was, the more his influence and importance would be increased among his friends and the public; and it would also, (to use a fashionable modern expression,) make a fine page in the history of the family. He therefore hastily sent to inform all his relatives, that the next day at noon they must hold themselves engaged to come to him, for the purpose of receiving a common satisfaction. At midday the palace swarmed with the nobility of both sexes and of every age; occasioning a confused intermingling of large cloaks, lofty plumes, and pendant jewels; a vibrating movement of stiffened and curled ribbons, an impeded trailing of embroidered trains. The ante-rooms, courtyards, and roads overflowed with servants, pages, braves, and inquisitive gazers. On seeing all this preparation, Friar Cristoforo guessed the motive, and felt a momentary perturbation; but he soon recovered himself, and said:—"Be it so; I committed the murder publicly, in the presence of many of his enemies; that was an injury; this is reparation."—So, with the Father, his companion, at his side, and his eyes bent on the ground, he passed the threshold, traversed the court-yard among a crowd who eyed him with very unceremonious curiosity, ascended the stair, and, in the midst of another crowd of nobles, who gave way at his approach, was ushered, with a thousand eyes upon him, into the presence of the master of the mansion, who, surrounded by his nearest relatives, stood in the centre of the room with a downcast look, grasping in his left hand the hilt of his sword, while with the right he folded the collar of his cloak over his breast.

There is sometimes in the face and behaviour of a person so direct an expression, such an effusion, so to speak, of the internal soul, that in a crowd of spectators

there will be but one judgment and opinion of him. So was it with Friar Cristoforo; his face and behaviour plainly expressed to the by-standers that he had not become a friar, nor submitted to that humiliation, from the fear of man; and the discovery immediately conciliated all hearts. On perceiving the offended Signor, he quickened his steps, fell on his knees at his feet, crossed his hands on his breast, and bending his shaven head, said, "I am the murderer of your brother. God knows how gladly I would restore him to you at the price of my own blood, but it cannot be: I can only make inefficacious and tardy excuses, and implore you to accept them for God's sake." All eyes were immovably fixed upon the novice and the illustrious personage he was addressing; all ears were attentively listening; and, when Friar Cristoforo ceased, there was a murmur of compassion and respect throughout the room. The gentleman, who stood in an attitude of forced condescension and restrained anger, was much moved at these words, and, bending towards the suppliant, "Rise," said he, in an altered tone. "The offence—the act certainly—but the habit you bear—not only so, but also yourself—Rise, Father—My brother—I cannot deny it—was a cavalier—was rather a—precipitate man—rather hasty. But all happens by God's appointment. Speak of it no more. . . . But, Father, you must not remain in this posture." And taking him by the arm, he compelled him to rise. The friar, standing with his head bowed, and his eyes fixed on the ground, replied, "I may hope that I have your forgiveness? And if I obtain it from *you*, from whom may I not hope it? Oh! if I might hear from your lips that one word—pardon!"

"Pardon!" said the gentleman. "You no longer need it. But since you desire it, certainly. . . . certainly, I pardon you with my whole heart, and all. . . ."

"All! all!" exclaimed the by-standers, with one voice. The countenance of the friar expanded with grateful joy, under which, however, might be traced an humble and deep compunction for the evil which the forgiveness of men could not repair. The gentleman, overcome by this deportment, and urged forward by the general feeling, threw his arms round Cristoforo's neck, and gave and received the kiss of peace.

"Bravo! well done!" burst forth from all parts of the room: there was a general movement, and all gathered round the friar. Servants immediately entered, bringing abundance of refreshment. The Signor, again addressing Cristoforo, who was preparing to retire, said, "Father, let me give you some of these trifles, afford me this proof of your friendship;" and was on the point of helping him before any of the others; but he, drawing back with a kind of friendly resistance, "Thee things," said he, "are no longer for me; but God forbid that I should refuse your gifts. I am about to start on my journey; allow me to take a loaf of bread, that I may be able to say I have shared your charity: eaten of your bread, and received a token of your forgiveness." The nobleman, much affected, ordered it to be brought, and shortly a waiter entered in full dress, bearing the loaf on a silver dish, and presented it to the father, who took it with many thanks, and put it in his basket. Then, obtaining permission to depart, he bade farewell to the master of the house and those who stood nearest to him, and with difficulty made his escape as they endeavoured for a moment to impede his progress; while, in the ante-rooms, he had to struggle to free himself from the servants, and even from the braves, who kissed the hem of his garment, his rope and his hood. At last he reached the street, borne along as in triumph, and accompanied by a crowd of people as far as the gate of the city, from whence he commenced his pedestrian journey towards the place of his novitiate.

The brother and other relatives of the deceased, who had been prepared in the morning to enjoy the sad triumph of pride, were left instead full of the serene joy of a forgiving and benevolent disposition. The com-

pany entertained themselves some time longer, with feelings of unusual kindness and cordiality, in discussions of a very different character to what they had anticipated on assembling. Instead of satisfaction enforced, insults avenged, and obligations discharged,—praises of the novice, reconciliation, and meekness, were the topics of conversation.

Father Cristoforo pursued his way with a peace of mind such as he had never experienced since that terrible event, to make atonement for which his whole life was henceforth to be consecrated. He maintained the silence usually imposed upon novices without difficulty, being entirely absorbed in the thought of the labours, privations, and humiliations he would have to undergo for the expiation of his fault. At the usual hour of refreshment, he stopped at the house of a patron, and partook almost voraciously of the bread of forgiveness, reserving, however, a small piece, which he kept in his basket as a perpetual remembrancer.

It is not our intention to write the history of his cloistral life: it will suffice to say, that, while he willingly and carefully fulfilled the duties customarily assigned to him, to preach and to attend upon the dying, he never suffered an opportunity to pass of executing two other offices which he had imposed upon himself—the composing of differences, and the protection of the oppressed. Without being aware of it, he entered upon these undertakings with some portion of his former zeal, and a slight remnant of that courageous spirit which humiliation and mortifications had not been able entirely to subdue. His manner of speaking was habitually meek and humble; but, when truth and justice were at stake, he was immediately animated with his former warmth, which, mingled with and modified by a solemn emphasis acquired in preaching, imparted to his language a very marked character. His whole countenance and deportment indicated a long-continued struggle between a naturally hasty, passionate temper, and an opposing and habitually victorious will, ever on the watch, and directed by the highest principles and motives. One of the brotherhood, his friend, who knew him well, likened him, on one occasion, to those too-expressive words—too-expressive, that is, in their natural state, which some persons, well-behaved enough on ordinary occasions, pronounce, when overcome by anger, in a half-and-half sort of way, with a slight change of letters—words which even thus transformed bear about them much of their primitive energy.

Biographical Sketches of Eminent Painters.

REMBRANDT VAN RYN.

REMBRANDT, one of the most original painters of the Dutch, or Flemish school, was born on the 15th of June, 1606, in a village near the city of Leyden in Holland. His family name was Gerretsz, but the surname of Van Ryn—or of the Rhine—was given to him, because the place where he passed his youth, and where his father rented a mill, was situated on the bank of the Rhine.

The miller had the sagacity to perceive that his son possessed superior abilities, and he was anxious to afford him the opportunity of studying literature; but it was with difficulty that Rembrandt could even be taught to read. The study of design alone seemed to occupy his thoughts, so that his indulgent parent, who carefully watched all his tendencies, placed him under the care of Jacques Van Zwaneburg, a painter established at Amsterdam, in whose school he remained three years.

He afterwards became the disciple of Peter Lastman, with whom he remained but six months, and then studied for the same space of time under Jacob Pinas. Whilst Rembrandt was with this master, he is said to have acquired that taste for strong contrasts of light and shadow, which he subsequently cultivated with such admirable talent. He formed his own manner entirely by imitating nature, and although he did not often select what was most beautiful or graceful, yet he represented every object with wonderful truth and force.

After quitting Jacob Pinas, he returned to his father's house, and for a long time he made the mill his studio. The space which he reserved for himself was inclosed on all sides, with the exception of a single aperture, from above, which admitted but a partial light.

It is worthy of remark that, although Rembrandt and Caravaggio belonged to very different schools, they resembled each other in three respects; namely, in their strong contrasts of light and shadow; their deficiency in taste with regard to the selection of their models, although they copied those models with great fidelity; and their habit of painting in a chamber where the light descended from above.

Rembrandt might probably have remained in peaceful obscurity in his father's mill, if one of his friends and brother artists had not prevailed upon him to take a picture which he had just finished to Amsterdam, and offer it to a connoisseur. That gentleman received him with great kindness and respect, and gave him a hundred florins for this painting.

This circumstance was the commencement of Rembrandt's future prosperity: it made him known, and his works were sought after by many persons of distinction. He therefore resolved on settling at Amsterdam, whither he removed in 1630.

The demand for his paintings soon became so general that he had scarcely time to execute the orders he received; and his pecuniary resources were also considerably augmented by his numerous pupils, most of whom were the sons of persons of rank or fortune.

His success now appeared certain, and he married a young girl of the village of Ramdorp, whose portrait he often painted.

At this time he finished his pictures highly, and their spirit, and strength of colouring, were worthy of his great genius; he afterwards adopted a bolder style, which produces a wonderful effect in his works.

His love of gain increased with his fame, and the debasing vice of avarice induced him to commit the most unworthy actions. Innumerable anecdotes are related of the manœuvres which he practised to increase his store of wealth. His wife encouraged him in these dishonourable proceedings; and she one day persuaded him to conceal himself, and to suffer the report to be spread that he was dead, in order to insure a greater price for his pictures. The experiment succeeded, and Rembrandt laughed at those whom he had thus grossly deceived.

The Burgomaster Six was a sincere friend and patron of Rembrandt, and he often endeavoured to induce him to frequent the society of persons in a superior station, but in vain. Rembrandt preferred living among people of an inferior class;

and there is no doubt that his choice of subjects for his works would have been more refined if he had moved in a higher sphere.

It has been observed, also, that, if Rembrandt had visited Italy, and studied the antique, his taste might have been improved; but this is very doubtful, for he had a collection of the finest Italian engravings, drawings, and designs, many of them taken from the antiques, from which he might have derived improvement; but it appears that he experienced more real pleasure in contemplating his own repository of old draperies, armour, weapons, and turbans, which he jocularly called his antiques, than he ever felt from surveying the works of the Grecian artists, or the productions of Raphael. Nevertheless, as M. Fuseli observes, "Rembrandt was, undoubtedly, a genius of the first class, in whatever is not immediately related to form and taste."

As to his colouring, it is surprising; and he perfectly understood the principles of the *chiaroscuro*. The lights in his pictures were painted with a body of colour unusually thick, but he knew the nature and property of each particular colour so thoroughly, that he placed every tint in its proper place, and by that means preserved his colours in their full freshness, beauty and lustre. The works of Rembrandt require to be viewed at a certain distance, whereas those of Titian will admit of the closest inspection.

Rembrandt's portraits are excellent, and he was so exact in giving the true resemblance of the persons who sat to him, that he distinguished the predominant feature, and the character of every face, without endeavouring to improve or embellish it.

Rembrandt's etchings are greatly admired, and carefully preserved in the cabinets of the curious in most parts of Europe. It is said that the sums he received for these etchings, and his pictures, were immense; and, as he was extremely economical, he must have left considerable property at his decease. He died in 1674, in his sixty-eighth year.

The genuine works of this great master are rarely to be met with, and whenever they are to be purchased they produce extremely high prices. Many of them are preserved in the rich collections of the English nobility; and there are several fine pictures by Rembrandt in the National Gallery in London.

NOTICES OF SOME ANCIENT CUSTOMS OF ENGLAND.

"Those iron times, when laws of battle were,
That weakly folk, of prowess small in fight,
The galling gyves of vassalage should bear."

Warton.

It has been well observed, that, as an historical incident, the Norman Conquest has no parallel; that we look in vain, throughout the records of other nations, for a parallel to the circumstance of a brave country being utterly subjugated in one battle, by the chief of a comparatively insignificant state. For, though for years and years the groaning English evinced their repugnance to their new

yoke by acts of insubordination, their revolts were never conducted with that spirit, or method, or general union which alone could give any chance of success: they displayed their inability effectually to resist quite as plainly as their determination not to submit, and the results were their utter degradation, and most complete and cruel subjection. The great blow was struck at once, though it was found frequently necessary to cauterize the wound.

The transcendent effect of this conquest on the annals of England is evidenced by the influence it has exercised over our historians, who generally begin the histories of the reigns of our kings from the Norman Conquest, assigning from thence to each reign, however unimportant, a separate chapter, and a careful detail, while all those monarchs who lived before the time of William, are clubbed together, and dismissed with a few hasty lines of reference: thus, in effect and reality, making the Norman conquest "a dark, determined, boundary line," a term "of beginning and ending," an era on which to found chronologies and calculations.

But this great error is now fully understood and carefully avoided. Historical writers of the highest talent and deepest research have, of late years, devoted their commanding talents to the study of Anglo-Saxon antiquity; and the result is, that our Anglo-Saxon kings are restored to the eminence they so justly deserve to occupy, in niches higher, aye, far, than those filled by the rapacious early Normans; and that the Anglo-Saxon laws and legislature are proved to be the very germ and foundation of that freedom which now it is our boast to enjoy. The most important principle of the English constitution, which, without asserting in direct terms that the sovereign is responsible to the nation, does virtually place him in subordination to the law, may be traced as it began to be developed in the Anglo-Saxon Empire.

It is indeed true, that the Anglo-Saxons, as a nation, had become enervated and debauched, and that the rule of the Normans, iron as it was, awakened a new spring and spirit in the land ultimately beneficial. But the rigid feudalism, to which William subjected the whole nation, certainly obscured, if it did not tend to destroy, those "liberties" derived from the Anglo-Saxon constitution, for the restoration of which there were often such fierce contentions, and which the barons wrested from the tyrannic John. Are we not right in saying that this charter, restoring their "ancient liberties," and ceded on the plains of Runnymede, is the foundation of the liberty we now enjoy?

And yet it is said that the direct influence exercised by William on the legislation of the realm, was of limited extent; that he respected the Saxon laws, and assented to the general demand of the people for their observance. "Though he hath had the name of Conqueror (says Baker, in his Chronicle), yet he used not the kingdom as gotten by conquest; for he took no man's living from him, nor dispossessed any of their goods, but such only, whose demerit made them unworthy to hold them. Only vacancies of offices, and filling up the places of those who were slain and fled, were the present means he made use of for pre-

(1) Palgrave, *Rise and Progress of the English Commonwealth*, vol. i. 654.

(2) Palgrave.

ferring his followers." But his devoted attachment to the laws, customs, and government of Normandy, was undeniable; and his prohibition of the use of the Saxon tongue was of more destructive effect, than any open opposition to the laws or customs of the realm. And these, his moderate measures, refer only to the early portion of his reign; for his arbitrary and cruel temper being driven to exasperation by the unceasing revolts of the English, he became exacerbated to the utmost extreme of tyranny; and "formed the scheme of rivetting such fetters upon the conquered nation, that all resistance should become impracticable."

He fully realized his purposes. All Englishmen, who still held honourable offices, were deprived of them; they were deprived of all their political privileges; all their property was confiscated; the whole soil (with very slight exceptions) was divided amongst foreigners; and the very name of Englishman became a reproach.

And, in the progress of this utter subversion of old rights, in apportioning the confiscated lands on military tenure to his Norman knights, William introduced as a universal system that foreign feudalism which was hitherto but slightly known in England. No land was granted to a noble, no estate held, but on condition of rigidly specified military service and feudal obligation. These nobles imposed correspondent obligations on their tenants, and multitudinous bonds, fines, and services were specified and rigidly enforced, which were unheard of in the Saxon times, when the extent of feudality seems to have been the obligation to attend the king in military expeditions, to assist in defending the royal castles, and in repairing the highways and bridges. To these Knute added the Heriot, or the forfeiture of a thane's horse and armour, on his death, to the king.

Thus, though the influence of the Norman invasion remains to this day, yet was its immediate effect not so perceptible as we might suppose among a great mass of the people; for the labouring class of that day, having no acknowledged station, passed like the cattle which they tended, and the ground which they tilled, from one proprietor to another, little heeding, in the mere exchange of misery, whether he were Norman or English. "They could not," says Henry, "so much as call their lives their own: for these might have been taken from them by their masters with perfect impunity, and by any other person, for paying their price to their owners. For some time after the settlement of the Saxons in England, their slaves were in the same circumstances with their horses, oxen, cows, and sheep, except that it was not fashionable to kill and eat them." And though this brutal disregard of human life became ameliorated as the influence of Christianity prevailed, still the extreme carelessness with which the life of a slave was regarded was evidenced by a law which prevailed a considerable time afterwards, viz. that if a slave killed his master, he was punished with instant death; but if he killed only a fellow-slave, his punishment was—just what his master pleased.

By the time of the Conqueror the Anglo-Saxon laws were minute and multifarious, and were, for the most part, duly administered. William confirmed many of the laws of Ethelbert; amongst them the *WERES*, or pecuniary compensation for personal injuries, which were most minutely de-

fined, prices being set on every species of bruise or wound with marvellous exactitude.

For example:—

If an ear be cut off, let compensation be made by payment of twelve shillings.

If an ear be cut through, let compensation be made by payment of three shillings.

If a piece of the ear be cut off, let compensation be made by payment of six shillings.

If an eye be lost, let compensation be made by payment of fifty shillings.

Whoever fractures the chin bone, let him forfeit twenty shillings for the offence.

For each of the front teeth six shillings.

For the tooth that stands by the front teeth (on either side) four shillings.

For the tooth that stands by the last-mentioned tooth, three shillings; and for every other tooth, one shilling. If the speech be affected, twelve shillings.

If a thumb be cut off, let compensation be made by payment of twenty shillings; and for a thumb nail, three shillings.

If the shooting finger (*i.e.* the forefinger) be cut off, let compensation be made by payment of eight shillings.

If the gold finger (*i.e.* the ring or third finger) be cut off, let compensation be made by payment of six shillings.

If the little finger be cut off, let compensation be made by payment of eleven shillings.

For every (finger) nail, one shilling.

For a smaller disfigurement or deformity (in the countenance), three shillings; and for a larger one, six shillings.

If a man hit another on the nose with his fist, let compensation be made by payment of three shillings. If there be a bruise on the nose, one shilling.

Et cetera, et cetera.

If we bear in mind the difference in the value of money then and now, we shall not consider these fines lenient. The *weres* were made to apply to every possible injury, from the slightest personal blemish even to loss of life: and it is a singular circumstance in the jurisprudence of the Middle Ages, that, if a person removed from one kingdom or province to another, his life and limbs continued to be valued at the same rate they had formerly been, whatever were the different custom of the country to which he was come; consequently those persons who removed from a rich country into a poor one, had much greater, and those who migrated from a poor country into a rich one, much less security for their lives, limbs, and properties. "The nose of a Spaniard (as Henry humorously illustrates the custom) was perfectly safe in England, because it was valued at thirteen marks; but the nose of an Englishman ran a great risk in Spain, because it was valued only at twelve shillings. An Englishman might have broken a Welshman's head for a mere trifle; but few Welshmen could afford to return the compliment."

One of the most interesting peculiarities of the early legislature of England was the compurgation, branching as it did into various ordeals, and later into the trial by combat.

The most ancient form of clearing an accused person seems to have been by oaths taken in his behalf; and we are told that the conflicting parties

appeared in the court or field, attended sometimes by as many as a thousand witnesses on each side, who discharged whole volleys of oaths at one another.

The person called upon to clear himself of the imputation of crime was required to bring his compurgators (as those who testified in his behalf were called) to a certain place; the number of oaths required for any crime being regulated by law. These compurgators did not testify their knowledge of the man's innocence, but only their belief of his own affirmation of the same. They each placed a hand on the Gospels, or on a holy relic, and the accused party placed his above the rest, and swore by the Almighty, and by all the hands that were under his, that he was not guilty. In some cases, two, three, or four hands were sufficient; in others, fifty or a hundred were required; and if one were withdrawn from the heap, the testimony of the whole was invalidated.

If the party accused were a female, law and custom required that she should obtain the requisite number of women to take oaths in her behalf, though in any other case they were not admitted to be compurgators. If the accused person, male or female, failed to clear himself by the requisite number of hands, if but one were wanting, he was condemned. This oath was called the oath of credulity, and hence arose the saying, "he has cleared himself by so many hands."

Afterwards a certain value was fixed on hands, according to the different ranks of the owners; thus, the hand of a thane was equal to the hands of six ceorls, &c. We must not omit to add that the law required compurgators to be of unblemished character; a "good name," says the historian, "was never of more value than now;" and a man of ill reputation was compelled to undergo a triple ordeal in cases where a single one sufficed for persons of credit.

There is an ancient form of words extant, which shows the solemn estimation in which an oath was held.

"May he who breaks his plighted troth be banished and driven from land and home, as far away as men may flee! Let him be a forlorned man, whilst fire shall flame, whilst the grass shall spring, whilst the fir-tree grows, whilst the babe shall greet after the mother, whilst the mother shall give suck to the babe, whilst the ship shall sail, whilst the shield shall glitter, whilst the sun shall shine, whilst the hawk shall soar, whilst the heavens shall roll, whilst the wind shall howl, whilst the waves shall flow. Let him be forbidden from Church and from Christendom, from the house of God and the fellowship of all good men, and never let him find a resting-place except in hell!"

Can a more impressive denunciation be imagined?

But, despite all precautions as to character, the multiplication of oaths had the natural effect of destroying their force, and then other means were resorted to, to imbue them with a degree of solemnity which might beneficially influence the minds of the compurgators. Of course each nation or province adopted such symbols as were most interwoven with their own prejudices and opinions.

The Danish army, we are told, A.D. 876, "stole into Wareham, a fort of the West Saxons. The king afterwards made peace with them; and they gave him as hostages those who were worthiest in the army; and swore with oaths on the holy bracelet,

which they would not before to any nation, that they would readily go out of his kingdom."¹

This holy bracelet, we find, was a solemn, perhaps the most solemn, oath with the Pagan Danes; yet a very solemn one of the Teuton was his sword, the symbol of the deity worshipped by his Scythian kinsmen. He whose universality of knowledge becomes daily and yearly more a subject of wonder and admiration, Shakspeare, has not less beautifully than faithfully illustrated this:—

Hamlet. Touching this vision here,—

It is an honest ghost, that let me tell you;
For your desire to know what is between us,
O'ermaster it as you may. And now, good friends,
As you are friends, scholars, and soldiers,
Give me one poor request.

Hor. What is't, my lord? we will.

Ham. Never make known what you have seen to-night.

Hor. } My lord, we will not.

Mar. } Nay, but swear't.

Ham. In faith,

My lord, not I.

Mar. Nor I, my lord, in faith.

Ham. Upon my sword.

Mar. We have sworn, my lord, already.

Ham. Indeed, upon my sword, indeed.

Ghost. (beneath). Swear.

Ham. Ha, ha, boy! Say'st thou so? Art thou there, Truepenny?

Come on,—you hear this fellow in the cellarage,—

Consent to swear.

Hor. Propose the oath, my lord.

Ham. Never to speak of this that you have seen,
Swear by my sword.

Ghost. (beneath). Swear.

Ham. *Hic et ubique?* then we'll shift our ground.

Come hither, gentlemen,

And lay your hands again upon my sword:

Swear by my sword

Never to speak of this that you have heard.

Ghost. (beneath). SWEAR BY HIS SWORD.

Ham. Rest, rest, perturbed spirit.

In later times the sword has been a very usual emblem on which to pledge faith, but though in each case a religious emblem, it has not been, as with the Danes, a Pagan, but a Christian one, from the handle being always made in the form of a cross. It was long used almost as a confessional, and in the last moments of the great and good Bayard, the knight *sans peur et sans reproche*, he held the crucifix (of his sword) upright before him whilst he prayed solemnly.

Our solemn oaths of justice are administered on the Gospels—the holiest emblem we possess; but formerly the relics of saints and holy men were esteemed, if not more holy than this, at any rate to add solemnity to the attestation;² and though this oath might even be obtained by fraud, it was yet considered imperatively binding. A vivid picture of the superstitious reverence attached to relics is found in the Roman de Rou, when William Duke of Normandy, having Harold in his power, causes him to take an oath to further his accession to the English throne, and Harold, making a virtue of necessity, takes it. Some extraordinary relics are placed there unknown to Harold, yet so marvellous is the effect, that it is said the *hand trembled* and the *flesh quivered* as he touched the chest containing them. In these days we might suppose the emotion was caused by his taking an oath which he did not mean to keep. After he had

(1) Saxon Chronicle.

(2) It was often usual formerly to cause an attestator to place his right hand on the *corporate*, or linen cloth, which covered the eucharistic emblems: hence perhaps our term *corporate* oath.

sworn, William triumphantly displayed the holy relics, which added such force to the oath, and at the sight of which he, Harold, "was sorely alarmed." We may remark, that oaths at this time were always taken *fasting*, often in a church, or, if not within the church walls, in a court held close by.

The Anglo-Saxon oaths were mostly, indeed very generally, clothed in alliterative rhyme, and great power was attached to the mere pronunciation of the words, even though the mind might not follow them. They were called "words of power." It is said that the promise or oath pronounced in our marriage service is the identical one of the Anglo-Saxons, and that, even when the benediction and other prayers were pronounced in Latin, this oath or promise was made in the vernacular tongue. The remains of the ancient rhythm are said to be most clearly perceptible in the Old Salisbury Missal:—"I take thee, John, to be my wedded husband—to have and to hold—fro' this day forward—for better for worse—for richer for poorer—in sycknesse, in hele—to be bonere and huxom in bedde and at borde—till death do us part—and thereto I plight thee my troth."

Many are the instances in which the mere pronouncing of the words was held binding in olden times, and we are not without "a case in point" in modern ones. The readers of the memoirs of Mr. Edgeworth, the father of the accomplished novelist, will remember that this gentleman, in his boyhood, one merry evening after a dance, went through the marriage service with a young lady, the key of the door serving for a ring, and another youth, as giddy as any of them, enacting parson. But so serious a matter did the elder Mr. Edgeworth consider this frolic, that he absolutely instigated a suit of *jaçitation of marriage* in the ecclesiastical court to annul this mock marriage.

If these ancient words of power do yet indeed retain their efficacy, it is, we fear, utterly bootless that so many fair ones, with natural and praise-worthy, however useless, foresight, do ever, when at the hymeneal altar, pronounce the cabalistic word OBEY with a *mental reservation*.

(To be continued.)

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

ANGEL WATCHERS.¹

BY S. M.

Not unwatched by heavenly powers
Sleeps the Church's lowly daughter;
Through the night's unconscious hours
Impulses of love are taught her,
Which, by day, she seems to win
From some kindly fount within.
As, beneath you tender light,
Weary Earth finds sweet reposing,
And the flowers that fold at night,
And the birds, their soft wings closing,
Dream not that their bloom at morn
Is of dewy moonlight born.
So we know not what we gain
In that silent time of sleeping;
Reck not of the gracious powers,
Which our hearts in mercy keep,
Falls, perchance, to woe away
Stains unknown, incurred by day.

(1) See Illustration, p. 32.

When the Powers of Hell prevail
O'er our weakness and unfitness,
Could we lift the fleshly veil,
Could we for a moment witness
Those unnumbered Hosts that stand
Calm and bright, on either hand;

Could we see—though far, and faint,
(Sight too great for eyes unholly!)
The face of some departed Saint,
Tinged for us with melancholy;
Oh, what strength of shame and woe
Would start up to slay the foe!

Oh, what joyful hope would cheer!
Oh, what faith serene would guide us!
Great may be the dangers near,
Greater are the friends beside us.
Oh, what reverent heed would then
Watch our footsteps among men!

But, that these things are, we know,
And we know—oh, thought of wonder!
These and us, the weak, the low,
Nothing, but our sins, can sunder:
For our brows are bathed and cross'd—
We are of that glorious host!

Lord, Thy saints in evil hour
So could feel Thine armies round them,
That no sin could overpower,
And no shape of Death astound them—
Make our faith what their's hath been,
EVIDENCE OF THINGS UNSKIN!

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

FACTS are to the mind the same thing as food to the body. On the due digestion of facts depends the strength and wisdom of the one, just as vigour and health depend on the other. The wisest in council, the ablest in debate, and the most agreeable companion in the commerce of human life, is that man who has assimilated to his understanding the greatest number of facts.—*Burke*.

I HOLD it a greater injury to be over-valued than under. For when they both shall come to the touch, the one shall rise with praise, while the other shall decline with shame. The first hath more uncertain honour, but less safety: the latter is humbly secure; and what is wanting in renown is made up in a better blessing, quiet. There is no detraction worse than to over-praise a man, for, whilst his worth comes short of what report doth speak him, his own actions are ever giving the lie to his honour.—*Feltham's Resolves*.

WHAT IS WATER?

LET us imagine ourselves introduced to some old seaman who has navigated the Arctic and Antarctic Seas, and traversed those great ocean-basins which cover more than half our globe. If he possesses a fair share of observation and common sense, we shall gain some important knowledge of the strange animals and singular vegetation nourished in the wide dark-heaving world of waters. Leaving him, suppose we betake ourselves to the sea-shore, and gaze, when all is calm, upon those countless music-speaking waves, or listen, in the storm, to the roar of the same waters, when, lashed by the tempest, they drive navies from their anchors, and beat down the cliff-walls along the coast. With such scenes before us, and the narratives of the sailor in our memory, the question "What is water?" may naturally force itself upon our atten-

tion. To answer this inquiry, and furnish other information connected with the subject, is the object of this article.

It was natural that men should for ages imagine water to be a *simple* fluid, and the boldest speculator, as he gazed upon the sea, had no conception that the whole mass was resolvable into *two gases*.

The ancients represented chaos as the primeval condition of the universe, but this chaos was rather a name for the general confusion or commingling of all the elements, than an expression denoting their reduction to primitive substances. Some, who maintained air to be the origin of all things, may seem to have thought water, with all other bodies, resolvable into some rarer element; but these too were far from the truth, which lay buried behind that mysterious veil of visible agencies under cover of which the sublime workings of

the universe are carried on. But, if the ancients failed to perceive that water was the result of a union between two widely different principles, the moderns were not quick in observing this fact. It was not till the latter part of the eighteenth century, that the severely trained philosophy of Europe could answer the question "What is water?" There is something surprising in this long ignorance respecting a substance which is daily before us, which the farmer and mechanic depend upon for daily comforts and necessities, and which, in the form of rivers, rain, and dew, must have been continually soliciting the attention of scientific minds. Distant planets and comets had been measured, their mysterious journeys noted as accurately in the astronomers' tables as the various details of an English county in the hand-book of the topographer; but the nature of water was yet unknown.

Such a fact proves that things near and common are often the least understood; so little are we trained to see nature's plainest signals, or listen to her voice.

Let us first state the nature of water, and then narrate the steps by which its composition was discovered. This widely-diffused fluid is formed from the union of oxygen and hydrogen gas, in the proportion of eight weights of oxygen to one of hydrogen. That is, eight grains of oxygen, mingled with one of hydrogen, will produce nine grains of water; and from nine grains of water the chemist can again obtain eight grains of oxygen and one of hydrogen. We have spoken only of the proportionate *weights* of the two gases required for the production of water; but, as hydrogen is among the lightest of gases, one grain of it will be of much greater bulk than a like weight of oxygen. If these gases be mingled by bulk or measurement, the proportion will be two measures of hydrogen to one of oxygen gas. Thus, whilst the weight of oxygen in water exceeds the hydrogen in the proportion of eight to one, there is more *volume* of the latter gas in the ratio of two to one. When we speak of these gases being *mingled*, we do not refer to *any* kind of mixture; for, if such proportions of oxygen and hydrogen are put together in a vessel, and there left, water will not be formed, the mixture must be set on fire, an explosion then ensues, the two gases totally disappear, and water *alone* remains in the vessel.

In this case it is evident that nothing except the gases contributes to the production of the water; from these therefore it must be formed. The gases may be set on fire by passing an electric spark into the vessel containing them. Thus the glass of water on the reader's table, the river which adds to the beauty of his neighbourhood, and the whole mass of the ocean-waters, are resolvable into common gases.

Before proceeding, let us briefly describe those two elements of water. Oxygen is without taste, colour, or smell, and a little heavier than the common atmospheric air; it is the chief supporter of animal life, being extracted from the air by the lungs, and thus keeps the wonderful mechanism of our bodies in motion. But this fluid, so necessary to our existence when moderated by admixture with other gases, becomes destructive when breathed in its pure state, as it then excites the vital functions so rapidly that premature death is the result. A man is reckoned to consume 46,000 cubic inches of this gas daily. Its name is derived from two Greek

words, one being *oēus*, (oxys,) acid, and the other *γενναω*, (gennao,) I produce; the compound term oxygen denoting something which produces acids; a name given to this gas from its property of forming acid substances, when combined with certain other bodies. Thus, if sulphur receives a large mixture of oxygen, it becomes sulphuric acid, or oil of vitriol.¹ It produces a brilliant flame when fired by heated substances; thus a piece of heated iron wire burns with vivid corruscations when plunged into a vessel filled with oxygen. Such are the properties of one of the constituents of water.

The other, hydrogen gas, resembles oxygen in three respects, being without colour, taste, or smell; but differs in its extreme lightness, common air itself weighing 14½ times heavier than this gas. It is inflammable. A jar full of it when fired will burn till all is consumed; and a particular combination of it with the substance called carbon produces the brilliant gas-light which nightly illuminates our towns and cities. The name is formed from two Greek words, *υδωρ*, (hydor,) water, and *γενναω*, (gennao,) and thus the word hydrogen expresses the fact, that this gas is the *basis* or principal element of water.

Such are the two substances which form the fluid of our oceans, seas, and rivers. There are some particulars which here call for attention. We have remarked the similarity of these gases in their want of odour, colour, and taste; and their product, water, resembles them in the same particulars, as *pure* water, unaffected by mineral, earthy, or other matter, is certainly tasteless; it will take any colour, but cannot be said to have itself a colour, and odour we cannot detect. So far the compound resembles the primitives. An inattentive thinker may assert that sea-water is not without taste, but that is not *pure* water, being mixed with several foreign substances, such as muriatic acid, sulphuric acid, soda, lime, and magnesia, which, it must be admitted, are quite sufficient to impart a pretty strong taste to the water. But further resemblance between the gases and their product cannot be traced, as the compound possesses some properties completely opposed to those of its elements. Both oxygen and hydrogen are *combustible*, and give out light during the combustion; but water tends to extinguish heat and flame.

Previously to experiment, we might have inferred, that when two combustible bodies were combined, the resulting compound would also be combustible. Where are the combustible qualities of the gases? Locked up in the secret cells of the water so securely that no force can draw them out,—so deeply hidden that the most delicate senses cannot detect their presence.

Again, oxygen gives increased energy to the vital powers, even developing them into an overwrought and destructive activity; whilst hydrogen, though it may be respired for some seconds, cannot be long breathed without being followed by death. Now we might have supposed that the admixture of the two gases would produce a wholesome air, the excessive power of the oxygen being corrected by the antagonist properties of the hydrogen; whereas the result is a fluid destructive to terrestrial life.

The *density* of water is another singular result,

(1) Hydrogen also contributes to form some acids, but these products are much less frequent than the combinations of Oxygen.

when we consider the extreme lightness of hydrogen, and that oxygen is but a little heavier than common air. Yet, from these aeriform substances, results a fluid capable of supporting enormous floating forts in the shape of first-rate line-of-battle ships. A cubic foot of hydrogen weighs about thirty-eight grains; the same bulk of oxygen about five hundred and eighty grains; whilst a like volume of water weighs 437,500 grains. Nevertheless, a certain weight of these gases will always produce a like weight of water, the point of difference being in the densities. Thus, while eight grains of oxygen, and one of hydrogen, equal a bulk of about seventy-five inches, the same weight of water will not be the twentieth part of an inch; such is the concentration produced by the chemical union of the gases.

Let us now trace the steps by which water was ascertained to consist of two gases, a discovery which some claim for the French chemist, Lavoisier, who was guillotined in 1794, and others for our countryman, Cavendish: other names must, however, have some share in the detection of this long hidden fact.

In 1776, Pierre Joseph Macquer, a member of the French Academy, and one of the writers in the *Journal des Savans*, noticed a fact in the course of one of his experiments which must here be mentioned. Over a vessel filled with burning hydrogen gas he held a porcelain saucer, and observed that the usual sooty deposit caused by flame was not produced upon the outside of the saucer, but that some drops of a pure dew-like liquid were formed. This attracted Macquer's attention; it was one of those signals thrown out by nature, through the observance of which men are led into the depths of her secret places. The product of the combustion was analyzed, and found to be *water*. Macquer was now on the verge of a great discovery: the book of nature was open, he read its characters, but failed to interpret their deep meaning. He simply recorded the fact observed, but drew *no conclusion*; and therefore left the prize for succeeding minds. The water on the saucer was of course produced by the hydrogen in the vessel uniting with the oxygen in the air, and thus causing the deposit noticed by Macquer, who lived just long enough to hear Cavendish, Watt, and Lavoisier, interpret the fact he had failed to understand.

In 1781, Priestley noticed that, whenever hydrogen gas and atmospheric air were mingled and exploded, water was the result; he made an inference from this, but not the correct one; as the water was supposed by him to be a mere deposition from the moisture existing in the air mixed with the hydrogen. The production of water from the gases was as yet a hidden thing. About two years after, in April, 1783, Cavendish made another step in advance, by exploding together hydrogen and oxygen instead of oxygen and common air; water was of course produced, but Cavendish saw not the cause. Almost contemporaneous with these experiments of Cavendish, Priestley made a most important observation; he found that the water produced was always *equal in weight* to that of the oxygen and hydrogen used in its production.

This was the key, the guiding fact, which might have suggested the unknown physical law to a philosopher. But Priestley stopped at this point, wondering at, but not understanding, the phenomenon, though his last observation respect-

ing the corresponding weights of the gases and water placed him in a position most favourable for completing the discovery. He now reported his observations to Watt, whose clear philosophic mind saw the meaning of the whole phenomena; and he declared that water must be a compound of oxygen and hydrogen, then called dephlogisticated air, and phlogiston (flame). This inference was quickly communicated to the Royal Society, and the world at last could answer the question "What is water?" At this point the honour of discovery seems due to Priestley and Watt; the former having ascertained the relations between the weight of the gases and that of the produced water, whilst Watt supplied the true theory of the facts noted by Priestley. But Lavoisier and Cavendish appeared subsequently as the elaborate expounders of the discovery; the former read his paper before the French Academy in 1783, and the latter expounded his views in an essay entitled "Experiments on Air," in 1784, before the Royal Society. Perhaps it may be proper to state that Sir Charles Blagden declared he communicated the discoveries of Cavendish to Lavoisier, whilst the latter was performing his experiments, and that such communications involved all the essentials of the theory.

Having noticed the steps in the advance to a knowledge of this great element of nature, we must now pursue some further considerations connected with this subject.

The facts attending the production of water bear a strong resemblance to those which accompany the formation of rain during a thunder-storm; there are in both cases a mingling of elements, a combustion, and an explosion, followed by the deposition of aqueous particles. Thus the agencies operating during a tempest may be similar to those employed in the experiments of Cavendish, Priestley, and Lavoisier.

Water may be said to take *three distinct forms*, the first being that usually exhibited at the ordinary temperature, to which condition the term water is alone commonly applied; the second that of steam; and the third, ice. A certain degree of heat, 212° of Fahrenheit's thermometer, is called the *boiling point*, as at that temperature water produces steam. This is the usual boiling point, but there is some variation even under ordinary circumstances; for water will boil at a less heat on the top of a mountain than in a valley, as the atmosphere there presses less upon the surface of a boiling liquid, and this enables it to vapourize at less heat. When the barometer stands at 30 inches, which represents the usual pressure of the atmosphere, the boiling point of water is 212°, but at 29½ inches, water boils at 211°; and should the barometer rise to 30½ inches, the temperature must be raised to 213°. If water be placed in a vessel under the receiver of an air-pump, it may be made to boil at various descending degrees; thus at a pressure answering to 23½ inches of the barometer, it boils at 200°; at 15 inches, the boiling point is 180°; and so the temperature required to make water boil will decrease as the pressure of the air diminishes, until all the air is pumped out, when the water, having no pressure on its surface, will boil at a point under 100° of Fahrenheit. Thus, the greater the atmospheric pressure, the more heat is developed in raising water to the boiling point. The general rule is, that, for every one-tenth of an inch which the barometer rises, the boiling point

also rises about one-sixth of a degree. The usual pressure of the atmosphere is fifteen pounds on every square inch of the earth's surface, and thus a square foot of water is forced down by a weight of 2,160 pounds. Now, if the atmosphere had a pressure represented by fifteen inches of the barometer, this same surface of water would be pressed down in the vessel by a force equal to 1,080, instead of 2,160 pounds. It would, therefore, exhibit much less heat when boiling in the former than in the latter case, the temperature being but 180° instead of 212°. Thus we see a correspondence between the heat shown in the boiling water of a tea-kettle, and the bulk of the whole atmosphere.

It is, of course, known to some readers that water cannot, under the usual atmospheric pressure, be heated to a higher degree than 212°; no application of heat can raise it beyond this, as it is then converted into steam. Water is said to boil under the atmospheric pressure; but, if this be doubled, so as to reach thirty pounds weight, or trebled, so as to amount to forty-five pounds, the boiling point will of course be raised in a corresponding degree. Thus, under a pressure of thirty pounds, steam is not produced till the water has reached 230° of the thermometer; with forty-five pounds on each square inch, the temperature will rise to 276° before steam begins to form. Between 32°, the freezing point, and 212°, the boiling point, is the range of water; below that temperature it is ice; above, it is steam. The latter element is frequently under our notice in these times, when the roar of the locomotive is heard in all parts of the land. The great peculiarity of water in its steam state, and that which most impresses the majority of minds, is its *power*. One cubic inch of water turned into steam will raise twenty hundred-weight a foot from the ground; and such a production of force is shown in ten thousand cases every day in England. When water is thus vapourized under the usual circumstances, it occupies 1,800 times the space which it previously filled; thus each cubic inch of water expands into more than a cubic foot of steam.

In the course of this expansion a remarkable effect arrests the attention of the philosopher. There is in steam an immense amount of heat which the thermometer does not indicate; for water at 212°, and steam at 212°, exhibit the same degrees of heat; whereas the heat in the steam exceeds that in the boiling water by nearly 100 degrees. This, being hidden from observation, and not capable of detection by the thermometer, is called *latent heat*. Its existence is fully proved by conclusive experiments, one of which may here be given. Let five and a half ounces of water, at the temperature of 32°, be placed in a vessel, the water will be close to the freezing point. Let one ounce of water be raised to the state of steam at 212°, as shown by the thermometer; then let this steam be conveyed into the jar containing the five and a half ounces at 32°, this latter will of course have its temperature increased by the admission of the steam; but how much increased, is the question. Many would probably expect the cold water to be heated, and the steam condensed into hot water, so that the whole mixture shall consist of hot water considerably under 212°, that is, under the boiling point. This supposition would not be absurd, since the one ounce of steam must have

lost much of its heat by contact with the greater quantity of water. But the actual result is, that the *whole mass* is raised to the boiling point, and we find in the vessel six and a half ounces of water at the temperature of 212°; that is, the ounce of steam at 212° has raised five times and a half its weight of water from 32° to 212°, and yet has lost no sensible heat; though it must have imparted nearly 1,000 degrees of heat to the cold water, which could not otherwise have been brought to the boiling state. This quantity of heat must therefore have been latent or hidden in the steam, and has been set free by the conversion of the steam into a liquid. But at present the reader must be left in possession of the simple fact, that whilst the thermometer indicates no difference of temperature between two substances, the one may in reality possess 1,000 times more heat than the other. We do not, however, call this body *warmer*, or *hotter*, because those terms would imply that the heat was *evident to the senses*, which is contradictory to all we have been stating. This singular property is of immense use to engineers, and all who use the agency of steam. It is clear it would be exceedingly dangerous did water "flash into steam" in a moment without the least previous warning. This it must do if the steam-heat were not gradually accumulated; and thus the gigantic power, instead of rising instantaneously, prepares itself at certain stages for its grand effort. Suppose that no steam could be formed till the moment when all the water in a boiler reaches the temperature of 1,180° of Fahrenheit, and that the *whole mass* was then *instantly* turned to steam; what machinery would be safe against such an explosion? As it is, all proceeds in beautiful order. At the boiling point part of the water begins to rise into steam; the remainder makes a pause; the heat appears to stand still; the thermometer denotes no rise in the temperature; yet heat is really rushing in from the furnace, though the increase is not manifested until *all* the water is turned into steam.

Let us now view water in a directly opposite state,—in the ice-form, which may be called the antipodes of the steam condition. When we consider the primary constituents of water, the hydrogen and oxygen gases, and take up a piece of ice, we must admit that little resemblance exists between such substances. Yet how closely are they allied. At twelve o'clock, on a winter's day, we may explode these gases, and produce water; in a few minutes that water may be a lump of ice. What is the link which connects these opposite states? A spark alone.

It is not our purpose to discuss the general properties of ice, but those only which belong to it, considered as water in a particular state. In both the steam and ice-form, water is expanded; for ice occupies more space than the unfrozen fluid, and thus breaks vessels in which it is confined. At 40°, water is most dense; from 40° to 32°, it *expands*, thus presenting an *exception* to the general law by which heat increases the volume. There is also an expansion in the act of freezing, as if the crystals were then making a final arrangement of their atoms, so as to prevent the ice from sinking to the bottom, and thus blocking up the beds of rivers by a solid mass of frozen matter.

When ice is changed into water, vast quantities of heat are received, but not indicated; just as in

the transformation of boiling water to steam. Thus if we take some ice at the temperature of 25°, and expose it to heat, we shall observe a gradual rise from 25° to 32°; but at that point it begins to receive heat without becoming warmer, and the thermometer remains at 32°, until all the ice is changed to water. The additions of heat will then begin to appear by the rising of the thermometer. The heat thus absorbed and buried, as it were, in the ice, is considerable, amounting to 140° of Fahrenheit's scale: a quantity sufficient to raise water from the freezing point, to that degree of warmth indicated by 172°. As this property of water was shown to be useful in causing a gradual production of steam, so is it highly beneficial by preventing destructive inundations in spring, which would inevitably follow the *instantaneous* melting of the winter ice and snow. Were it not for this singular absorption of heat, "at the first touch of warmth," to use the language of Whewell in his *Bridgewater Treatise*, "all the snow which lies on the roofs of our houses would descend like a water-spout into the streets: all that which rests on the ground would rush like an inundation into the water courses. The hut of the Esquimaux would vanish like a house in a pantomime: the icy floor of the river would be gone without giving any warning to the skater or the traveller." Thus in the liquefaction and vapourisation of water, the beautiful agency of latent or hidden heat attracts our admiration, and provides for our happiness.

Water has several properties which render it useful in various applications of machinery, and in many scientific investigations. For instance, a relation exists between the weight of the atmosphere and the height to which water rises in a tube, whence all the air has been pumped out. In such a pipe, water will rise to the height of thirty-four feet, being forced up by the pressure of the air on the water outside the tube. A column of water, thirty-four feet high, and covering a square foot of surface, weighs as much as the whole perpendicular pressure of the atmosphere on a like area. Thus the water-column balances the air-column; and the effect of this is seen in the making of pumps, the working of steam-engines, and in drawing water from deep mines. Upon these principles a most effective barometer is formed, water being used instead of mercury, and a thirty-four feet tube employed in place of one thirty inches high. For as air presses with a force of fifteen pounds on each square inch, and as a column of water thirty-four feet high, with an area of one inch, is of the same weight, it is evident that one column will balance the other. If the atmosphere become lighter, the water in the tube will fall; if heavier, the aqueous column will rise. Such a barometer gives notice of the slightest atmospherical changes, which the large divisions of its scale, more than thirteen inches for each inch of the mercurial barometer, enable the observer to read with great minuteness.

Water is also useful in preserving the standards of weights, and measures of capacity from variation. A cubic inch of water, at a fixed temperature, say sixty degrees of Fahrenheit, and at a constant atmospherical pressure, such as thirty inches of the barometer, will always retain the same bulk; in other words, it will never become more, never less, than a cubic inch; nor will its weight vary in the least, keeping at 252½ grains nearly in air, and

252½ in a vacuum; thus serving for a standard both of measures and weights.

Water is not, strictly speaking, an *incompressible* fluid, though formerly it was supposed incapable of reduction to a smaller bulk by any force, however great. It has, however, been compressed a little by the application of vast powers, nine cubic feet having been pressed into eight by a force equal to a weight of 30,000 pounds on a square inch. But, for most practical purposes, and in the management of hydrostatical and hydrodynamical machines, water may be considered incompressible, not yielding save to enormous pressures.

Some answer has now been given to the question, "What is water?" and we must therefore conclude this article on a fluid which has in past ages contributed, by its silently accumulating deposits, to form vast mountain ranges of strata, abounding with the vegetable and animal remains of ancient times; and is now producing new islands and deltas where succeeding tribes of men may yet found populous cities.

BLACK FRITZ.

CHAP. III.

Two days after, during which Frederick knew how to prevent, by an ingenious contrivance, his cousin from passing through the picture gallery, he led her from her chamber with a look of triumph; and, whilst he promised to show her something in a very mysterious manner, he brought her straight before the portrait of the wretched prisoner, which she had so often regarded with such deep sorrow, and said, "Now see, Luitgarde!"

Quite overcome, she retreated. The face of the prisoner was turned fully towards her, and the features of the unknown, and his large, deep-set eyes were fixed on her in gloomy despair. With a loud shriek she put her hands before her face, and disappeared.

Frederick followed her, glorying in the frightful consequence of his art, and in his adroit surprise; he found her trembling in all her limbs, supported by a column, in another room: her bosom palpitated, her entire frame was agitated.

"Good heavens, dearest cousin! what is the matter with you! Can, then, an artistic experiment so frighten you? You know we have often combated on that point; you found the portrait so decidedly interesting, because the features were not to be seen, and one could fancy them to be what one wished. I always considered it was only a painter's caprice, that he did not dare represent the suffering and desperation of the captive. Now I have endeavoured to solve the problem, I have given to the captive the face of the robber chief."

"Alas!" said Luitgarde, with a trembling gesture.

"I can assure you it is as like as possible: and your fright bears testimony to its successful execution. But come again, and look at it once more."

"Not for any consideration on earth," said she, with firmness; "into that chamber will I never set foot again."

"Do not be so childish. It was a bold fancy of mine, I avow, but I must regret that it has so completely succeeded, since I have disgusted you by that means with the portrait. I find —"

"Find what you like!" exclaimed she; "but he assured you have given me infinite pain."

"Pardon me, cousin, I had no wish to do that, and though I understand that the first glance could frighten you, still I do not comprehend —"

(1) Hydrostatics is that part of scientific mechanics which relates to fluids at rest, and hydrodynamics to fluids in motion.

"O, my God! my God!" exclaimed Luitgarde, and her tears burst from her eyes.

Frederick stood amazed; he endeavoured to tranquillise her, for it grieved him to see his amiable and fair friend in such deep agitation. It was flattering on the score of his own vanity, because he ascribed the whole affair to the successful effect of his great art.

At length Luitgarde recovered; she went to her chamber, but not again through the gallery where the altered portrait, with its unfortunate resemblance, and expression of frightful despair, came before her like a terrifying spectre.

The old count heard of the event; he highly disapproved of his son's inconsiderate joke, and had the portrait removed to another place, in order that his niece should not be obliged many times every day to make a long circuit through cold passages, and over steps. Still, however, though the picture was removed, and her road again open, she never went through the gallery without the portrait of the wretched captive rising up before her. The degradation into which an existence of a noble nature was sunk, and the prospect of a terrible future, where he, even so laden with chains, deprived of liberty, of the light of day, would number by deeply-cut notches the duration of a lamentable existence in dark despair,—all this lacerated her very heart, and in the background that gloomy dungeon view; and what did that offer to her sight? Death, by an executioner's hand, and the eternal damnation of a soul which was made for salvation, and which, perhaps, still at that moment was capable of better feelings.

One thought most powerfully seized her, and occupied her perpetually; it was a bright point, towards which her soul, in the cruel embarrassment that surrounded her, was guided with ardour and continually-increasing love. To save his soul, if it were possible, and that youth to whom she could not deny the warmest sympathy, who had shown himself towards her nobly and tenderly, and whom she might reclaim from his frightful ways. The more she reflected on this project, the more brilliantly did it present itself to her; she thought that this was a truly beautiful object, and might even become a redeeming subject for a whole existence occupied with it, and she wove a thousand plans and possibilities, how this might take place through her in the best manner.

The winter was now gradually approaching to its end; warm breezes passed over the earth, and melted in all places the snow from the hills, and broke the ice of the river; winter's mute rigidity yielded to the murmur of the falling drops, and of the discharged waters; spring, with all the feelings that follow in its train, was all in motion in animated and inanimate nature.

While Frederick looked forward with great satisfaction to his approaching marriage, Luitgarde felt her breast affected by painful presentiments, of which the cause was not this festival; indeed, every mention of it, of which now there were daily more, struck as with an icy hand into the buds of her melancholy hopes. Still was it the wish of her honoured uncle; the distinctly-expressed will of the whole family: and Frederick was so kind, so attentive to her, that her stronger reason imposed acquiescence on her rebellious feelings, and she took every pains to share the joy of the whole house upon the approaching gladsome event. In the mean time, a particular circumstance occurred to retard the marriage. An unforeseen, but important, matter claimed the presence of the old count at Prague for some time, which obliged him to defer for an uncertain period its celebration. Frederick was to remain at the castle, and attend to all the arrangements and domestic matters, but Luitgarde, who could not properly remain with him, was to accompany his father.

Two days of the journey were happily accomplished, and the travellers thought they had no longer any dangers to fear, when suddenly, in a forest where the

bad road obliged the carriage to move slowly, a number of mounted robbers sprung forward from both sides of the way, forced the postilion and servants, who were about to defend themselves, with loaded pistols at their heads, to come down from the carriage, and then with furious voice demanded of the travellers their money and valuables. The count replied intrepidly to them, but one of the robbers took out a pocket-pistol, and was about to fire it at his head. At this moment Luitgarde rose up in great terror, drew from her bosom the ring, held it to the robber's face, and cried out, "Begone, and leave us; respect the commands of your chief!" The robber fell back, examined the ring, took off his cap, called his comrades together with a whistle, and they all sprung at full gallop into the thicket.

At the end of a long pause of mute astonishment, the count at last asked an explanation of the strange occurrence; and Luitgarde, deeply blushing, was obliged to confess and relate what had taken place with regard to the ring.

Count Martinitz listened to the narration of his niece with deep vexation. A robber's love for her; the evident interest which the audacious youth had succeeded in inspiring her with; the reflections on his son's fate;—all agitated his inmost soul with painful sentiments. Still he preserved a gloomy silence, and only desired to see the ring. Luitgarde handed it to him. "Gracious heavens!" exclaimed the count, "this is the Lansky arms! It is a seal ring which I have often seen on my friend's finger, but without the diamonds that now adorn it! How does the man come by this ring?—and it is dear to him—has he told you?—and yet he has presented it to you!" and the count shook his grey head.

"Lansky! Lansky!" repeated Luitgarde, slowly and reflectingly; and that child, destroyed by the flames, and the parrot's talk, fell heavily on her heart. Victorin von Lansky had been destined for her by her mother and his father, and who had brought to her the parrot, and who taught it the name of her lost intended husband? She shuddered; for, from the very depth of confused feelings and thoughts, there arose a presumption, which awoke in her terror, sorrow, and painful pleasure.

"How came the highwayman by this ring? Do you know anything about it?" asked the count.

"Nothing, dear uncle, but what I have already told you. The ring is very dear to him, as he assured me. I wished to send it back to him, when I had no longer occasion for it; but he refused it with evident displeasure."

"The man is in love with you, that is clear. Now that explains many other things, and the present of the stolen parrot. A laughable, but shameful affection, indeed, between my niece and a bandit chieftain!"

This word sunk deeply and painfully into Luitgarde's breast; she was no longer able to restrain her tears; but from the open wound arose pride and the resolution to remain true to the unfortunate man, who, in the very midst of his evil doings, was yet capable of better feelings, and courageously to take his part.

Mostly in silence, and in deep reflection, they reached Prague. Count Martinitz pursued his affairs, and with them secret inquiries about the ring. Luitgarde felt she was watched, and not so unconstrained as in the country. This annoyed her; for she knew she was innocent of any criminal conduct, or evil intention; she had earnestly combated every seductive recollection; she intended to give her hand to Frederick; to be his affectionate and devoted wife. More he himself did not ask, for more he did not give; and the place, which probably a certain portrait held in Luitgarde's heart, was quite clearly and openly occupied in her cousin's breast by his collections and works of art. She did not look too closely at the point where she herself was deficient.

The history of the count's extraordinary escape from

the hands of the robbers made much noise at Prague. The domestics, who did not know all the particulars, had represented the affair in a confused and inaccurate manner. Passing from mouth to mouth, exaggerated, disfigured, it came to the knowledge of the chancellor of the superior court of law, who had for a long time the commands of Frederick the Third, to act with the greatest rigour and zeal against the extension of the robber bands; and, in furtherance of this mandate, he had now put a high price on the head of Black Fritz. He went himself at the same time to the Count von Martinitz; and, making his duty an excuse for the liberty he took, he called on him, in the name of His Majesty's High Court of Justice, even in that of the public good, for a true and exact statement. His niece's position in the extraordinary affair to a certain degree placed the count in embarrassment; still he replied to the chancellor's questions as candidly as he was able; and at length the latter desired to see the ring.

Luitgarde was obliged to give it up, which she did with the greatest unwillingness; she entreated, she threw herself at the knees of her uncle, who called on her for it; a dark presentiment ran through her soul; she would so willingly have preserved that pledge of the tender respect of the unfortunate young man for her;—and now, into what hands must it fall! Still her uncle claimed it in his own name, in the name of the public order, and of that peace which, through the misdeeds of the lawless banditti, had been quite long enough troubled. Luitgarde was no longer able to refuse it; mute and sorrowful, she gave it up. Perhaps at this moment was the wretched man betrayed, and through her means! The chancellor also knew the arms of the Count von Lansky; he took the ring with him, and promised to return it to him within eight days.

Those eight days were passed in painful uncertainty; and the more Luitgarde's feelings for the terrific adorer came into conflict with morals, integrity, and older ties, the more ardently was it inflamed against opposition and contrariety; and a melancholy, painfully sweet conjecture, which, since the nearer acquaintance with the ring, allured her a thousand times into extraordinary reveries, accomplished the spell.

But the eight days were passed—and ten at last fourteen. In the agony of her heart, Luitgarde had dared to recall the ring to her uncle; he dismissed her with an ill-boding look, saying that it was not simply permitted, but even a duty, to employ every means, which might lead to the detection and arrest of so atrocious a criminal, and that he was ashamed of the sympathy which seemed to agitate the breast of his relation, the intended wife of his son, in favour of so lawless a being.

To these words Luitgarde made no reply, but resolved not to hold any further communication on this matter with her uncle, who, as she thought, did her injustice, and especially conducted himself unfairly on this occasion. She began to give herself up to the fancies which allured her to comparisons between her two admirers. She imagined what Frederick would have been had he been flung by a bitter fate into the forest, among wicked, corrupted men; if he had been obliged to maintain his honour, his life, his liberty, against a hostile authority, and among criminal examples; and she placed now the unfortunate, fallen young man, with his superiority of mind and body, with his genius and aspirations, in the bosom of an affectionate family; she imagined him among worthy men of honourable habits, brought up in every exercise of virtue and useful knowledge; she undertook to complete the portrait, by supposing him to be actually Victorin Lansky, her first intended bridegroom; and she gave herself up to her sorrow and to her tears.

Some days passed, when at breakfast her uncle gave her back the ring, saying that the chancellor had no longer any occasion for it. An icy coldness seized

Luitgarde; she took it in silence from his hand, with a terrible presentiment, and suddenly quitted the room.

Upon the evening of the same day one of her maids burst into the chamber with loud joy, to announce to her the report that Black Fritz was taken, and was on the succeeding morning to be brought, heavily chained, into Prague. Luitgarde was petrified with horror. The darkness of the evening concealed from the maid her mistress's death-like paleness, and the girl's busy chattering allowed her to listen without saying a word, or rather, to sink into lacerating thoughts. "And I have betrayed him!" did she ejaculate at last, in sorrowing accents, as the maid left her apartment. That the ring was the cause of his arrest, that his supposed inclination for her was made the instrument of his ruin, was demonstrated to her incontrovertibly; and, from that moment, as the unyielding law was now fully satisfied and nothing more was to be dreaded from the terrific man, a deep, a holy interest, linked with bitter reproaches against herself, and with the consciousness of her fault towards him who, if even guilty towards the whole world, still with respect to her had acted nobly, seized violently on her soul, and made every other inclination, even every retrospective one, disappear.

A turbulent running to and fro in the street, the deportment of the domestics, all convinced her the next morning that the news of the maid was only too true. Taken, loaded with massive chains, almost every member of his body tied down, and attended by a company of soldiers with loaded muskets and fixed bayonets, he was led as a welcome, and even yet as a terrific spectacle, through the streets of the town on a wagon, surrounded by guards. Everybody ran to see him, everybody related something of Black Fritz; and everybody seemed to unite to tear Luitgarde's heart to pieces.

"Ah! what a handsome man he is! What beautiful eyes he has!" said one maid to another, in the corridor before Luitgarde's door.

"And have you seen," said the other, "how fiercely and terribly he cast his eyes down on the ground, and at times shook his chains, which made me trouble with the noise?"

"Yes, it was as if he wished to frighten the people who ran to see him."

"Not that, however," replied the second; "I rather think the heavy chains must press him and wound him not a little; his right hand was quite covered with blood, poor man!"

"What is the matter with you, that you compassionate a highwayman?"

"Oh! he is an unfortunate man, and will bitterly pay for it."

Luitgarde's heart was full to overflowing, and at that moment would she have given half her fortune to be allowed to shed her tears for a lonely hour. But visit came after visit, and every one repeated the account of the entry of the dreaded robber, and everybody had some anecdote of him, whether true or fabricated, which painfully afflicted the heart of the unhappy maiden.

The examinations of the captive now began; and many circumstances relative to his destiny, his actions, and his imprisonment, were known. Not from his own mouth, however, for he obstinately refused to confess anything. His accomplices related, that he had been brought up in the Saxon Erzgebirge, by a collier, who, himself a member of a band of robbers, accustomed the boy—who named him with repugnance, father—to a rude, hard life, and to deeds of violence. At fourteen years of age he ran away, and fell among Swedish light troops, who received the well-grown daring boy, whose gallant bearing and cool resolution made him the favourite of his comrades, over whom he soon won a kind of authority. He gradually observed how deficient he was in acquirements in order to be or to become as renowned as others who stood above him. He was

not discouraged, however. In idle hours, while his comrades drank or gambled, he learned to read and write, and also to make military drawings. The commandant of the corps soon took notice of him. Fritz became a non-commissioned officer, and, in a short time, on the occasion of a little expedition, which only his enterprising courage would undertake and accomplish, he was made an officer. A brilliant road now lay open before him, and all the force of his will was directed in search of honour and renown. He wished to rise, to dazzle, to command; he threw everybody into the shade, for a glimmering recollection of a better state of things in his earlier childhood than what he found in the filthy collier's cabin, and among his vulgar associates, floated before him. He who would have reminded him of his residence and his life in the Erzgebirge, would have mortally offended him; he no longer called himself Fritz, but Victorin, for an uncertain tradition existed in his breast, that he had been, in other times, called by that name, and he sought ardently after the splendor which, as he believed, belonged to his birth, and which a fatal event had torn him from, and hoped to rise by courage and talent. But, inflexible, intrepid, and proud, he had always neglected to make himself friends, confiding only in his actions, which should be his testimonials; his enemies and those persons jealous of him knew how to turn all this to his disadvantage; persons of little worth and younger men were preferred to him, because they possessed the advantage which he had not, of being able to put themselves forward in the eyes of the world. All this deeply wounded him, and filled his breast with feelings of hatred. At last he was on the point of attaining his wish, and of entering as captain into a regiment of the line, when peace was concluded, his corps was broken up, and most of the troops were discharged. Now that all further hope of advancement was lost to him, his old lawless habits awoke; want, despair, and revenge urged him on; men without bread and without occupation associated themselves with him, and he was chosen, with unanimous consent, their leader and captain. The most daring exploits, the most hazardous projects, were executed by him; he even maintained a strong discipline, and a rude justice among the members of his terrific association; thus was it possible for him to achieve things almost incredible, and to ward off every treachery and danger.

At length, it was said, his presence of mind, his penetration, gave way to the seductive voice of a passion which spoke stronger than honour, courage, and prudence; he fell into the adroitly-arranged snare, and accepted a mysterious invitation, which came to him from a woman whom he ardently loved, and which was strengthened by a ring, which he himself had given to her in a happy moment as a pledge of his affection. Thus he was taken, and poured imprecations on the faithless one who had deceived him, and whose faithlessness he felt more acutely than his chains, or even the death that was before his view; for her alone on earth he had truly loved, and from her alone he had deserved gratitude.

No one who related the whole, or part of this history in Luitgarde's presence—for Black Fritz was the general conversation—thought how painfully it touched a heart which felt itself so deeply affected without any fault on its part. She avoided on this account, as much as possible, to go into the world, but she was not able to avoid visiting her relations, without exciting her uncle's dissatisfied humour.

At the house of one of these, a respectable old lady, she met with a clergyman, whose mild exterior and calm benevolence won her heart at the first introduction. Even here, the conversation fell soon on the news of the day, the robber-chief; and it happened that he was the priest whose solemn duty it was to prepare criminals for death, and to accompany them on their last journey. With warm interest did the

worthy old priest dilate on his prisoner. He lamented many a fine disposition here destroyed, nor did he refuse to the fallen man his deep sympathy; but what most afflicted him was, his impenitence; he manifested no trace of repentance for all his misdeeds, nor would he make any confession; more than once, indeed, he suspected him of the unholy effort to deprive himself of life.

"There is a wild despair in the young man," said the priest, "which appears to proceed less from the consciousness of his guilt, or from fear of punishment, than from an immeasurably wounded pride, and from a deep irritation against a person, who must have deceived or betrayed him."

"And has he not explained himself, nor indicated who this person is?" enquired Luitgarde, trembling.

The priest shrugged his shoulders. "It must be a woman," said he. "I gather this from some accidental words and signs; but he is not to be moved to any confession; not even to this."

"Then he will be put to the torture without any further delay," said one of the gentlemen present.

Luitgarde's heart ceased to beat, and a death-like paleness covered her whole face; the priest looked at her unobserved, but attentively.

"This will not be necessary," said he, "for he denies nothing; he leaves to the judges to speak, and decide as they like respecting him; the overt acts are proved by the declarations of so many other criminals and witnesses, that he cannot possibly escape. His life is certainly condemned; would to God that it were my power, that I were so happy as to save his soul."

Luitgarde look long and inquiringly on the priest. In his countenance lay so much humanity, so much patience, so many heavenly-seeking aspirations, that a resolution which began to rise in her mind became more and more clearly defined. From that moment she took but little interest in the conversation; her whole mind fixed itself on one thought.

The following morning she rose early, said she wished to communicate with her confessor, and went accompanied by her maid to the cloister, where Father Augustine lived, whose order and name she carefully got possession of. She had him called by the porter, and the priest soon made his appearance. With a deeply-wounded heart, amidst tears of sorrow and shame, she now exposed to the priest her whole destiny, the disposition of her heart towards the unfortunate man, her engagement with Frederick, the history of the ring, the crime of treachery which was imputed to her, her anguish at the consequences of the captive's desperation, at the thought of the everlasting death of his soul, and her hope, although not perhaps an open avowal on her side, that a knowledge of her feeling for him, and her repentance at the unintentional wrong which through her had been committed, might melt his obduracy, and open a way for milder sentiments, perhaps even for a pious thought into his proud heart.

The worthy father had allowed her to speak out freely; he sat still awhile in deep reflection: at last he rose and spake.

"It is possible, my child, that your meritorious resolution may be efficacious. I will reflect on it. However, in the first place, do not speak of your project to any one, and give no place to any kind of hope; for we have not to do with a light-minded inconsiderate sinner, but with a hardened criminal." And thereupon he penetrated, with convincing eloquence, into the very depth of her heart; he laid before her all the possible consequences of her step, and at last desired her to return to him again in eight days.

She quitted the holy father, sick and in anguish, full of doubt of him, but, however, firmly decided in spite of all hindrances which appeared to rise up against her, to attain her aim, either through him or by some other means.

SCENERY OF THE GREAT WESTERN RAILWAY.

No. III.

From Cholsey the Railway passes in South Moreton, "Moor-town," over a wide grassy moor, with eminences, upon which are built the villages of North and South Moreton. There are also some fine entrenchments, one of which, Sinodun Hill, separates the Thames from the railway. Eastward is Brightwell Barrow, and below is the point

"Where Isis, Cotteswold's heir, long woo'd, is lastly won,
And instantly does wed with Fame, old Chiltern's son."

The spot where this marriage takes place, or, as Drayton further phrases it,

"The winding Isis with the fruitful Thame,"

lies in the parish of Dorchester, and is defended by a double line of earthworks, extending from one river to the other. Dorchester was originally a Roman station, and probably occupied Sinodun, the Celtic hill just named.

The vale now becomes less attractive in its scenery; the line, after leaving the Moreton cutting, passes over Hagbourne Marsh, towards Didcot. The railway traveller sees but few antiquities in this part of his journey. Nevertheless, the several village churches present some good examples of Norman, Early English, and Decorated architecture; and there is a very interesting earthwork, thus neatly noticed in the *History*:—"Cuchelmsley Knowe, corrupted into Scutehamfly Knob, is a large barrow upon the chalk ridge, above Hendred, 853 feet above the sea, and well known as a land-mark for many miles round. The farmer, upon whose land it stands, a better agriculturist than antiquary, has already carted away one-half of the soil for manure."

The Railway next reaches Steventon, which stands upon the gault clay, slightly covered with chalk, marl, and green-sand: the verdure displays the value of the lower marl in an agricultural point of view: the village is subject to floods, and is intersected by a raised causeway, paved with grey-wether and coral-rag boulders.

The Steventon Station is fifty-six and a quarter miles from London, and sixty-two from Bristol; and here the Oxford traffic joins the line. The *History* contains so admirable an illustration of Railway economy at this point, that we shall quote it:—

"The Railway was completed to Steventon in June, 1840; and a number of villages, probably as little known as the most remote of Cornwall or Northumberland, were then laid open. Here, as almost generally throughout the vale of Berks, the communication of the different villages with each other and their market town is very imperfect, and liable, in many cases, to be flooded, and rendered impassable to a considerable extent. Upon such clay soils as that of Steventon, it is not uncommon to find the outlying cross-roads completely blocked up during the winter season. The population of these villages varies generally from two to four and five hundred persons, and sometimes reaches seven or eight hundred. A comparison of the present numbers with those returned under the census of 1801, shows usually a moderate increase: in some few cases, indeed, the population, not only from 1801, but from the date of Elizabeth, and probably from a much earlier period, has been stationary. Notwithstanding this uniformity, it is remarkable how completely the families seem to change. In the case of one rather secluded parish, with no resident landed proprietor, and the population of which had remained stationary in point of numbers some centuries, a careful analysis of the register showed that the surnames were in a continued state of fluctuation, any one name rarely remaining in the parish above one century, and a very small number indeed turning the second century."

From Steventon, the Railway passes over a flat open district to the Faringdon Station, sixty-three and a quarter miles from London, six from Faringdon, and three from Wantage; thence by a deep cutting past Baulking, and by another cutting past Beckett, the beautiful seat of Viscount Barrington, east of the village of Shrivenham. At Coleshill, too, the Earl of Radnor has a seat built by Inigo Jones. The population of this part of Berkshire is almost wholly agricultural. The upper part of the vale is mostly grazing and dairy land: the lower part commonly arable, and the chalk downs extensively occupied as sheep-walks. "The cottage manufacture of pillow-lace, so common under the Chilterns in Bucks and Oxfordshire, does not extend at all generally in this direction, nor is its place supplied by any other handicraft."

The Shrivenham Station is seventy-one and a quarter miles from London. The antiquities of this middle district of the Railway are extremely curious: the numerous churches, though mostly small, are good specimens of Norman, Early English, Decorated, and Perpendicular. One of the finest is Wantage, a large and handsome church, composed of a tower, nave, aisles, transepts, chancel, and chapels: its finest monument is a life-size alabaster effigies upon a rich altar-tomb of a knight of the Fitzwarren family. Uffington church, too, though very little known, is an exquisite and perfect specimen of the Early English style. Shillingford has an Early English tower and spire, and some lancet-windows of great length.

Nor are the churches the most striking antiquities of the locality. The sky-line of the chalk downs, as seen from the vale, is continually broken by the elevation of some earthwork, carrying the mind's eye back to times of war and bloodshed, spoliation and conquest. On the steep escarpment of Uffington Hill, just below the entrenchment, is the celebrated White Horse—a rude figure of a horse at full gallop, formed by removing the thin layer of turf, and exposing the white surface of the chalk. The figure is about 380 feet long, and is said to cover an acre of ground: the side of the down is 893 feet above the sea level; and in particular directions, the horse may be seen ten or twelve miles distant. This famed White Horse has given rise to much controversy among antiquaries as to the object for which it was cut out; said to have been to commemorate the victory of the men of the Saxon kingdom of Wessex, under Alfred and Ethelred, over the Danes, in 871. Be this as it may, the horse is of Saxon origin, or of still higher antiquity; and we think this antiquarian theory by no means a wild one. The figure has given to this district the name of the Vale of White-Horse: the country people had an ancient custom of assembling to "scour the horse;" i.e. to clear away the turf, so as to keep the form perfect. On such occasions, a rural festival was held, and the people were regaled by the lord of the manor; but we have no record of this since 1780.

Just under the White Horse Hill is a knoll of chalk, called the "Dragon Hill," described as a mound or barrow, intended to cover the dead, whose victory the horse is supposed to commemorate: this is a plausible link in the chain of the antiquary's theory; but it is by no means certain that the mound is artificial. At all events, the neighbouring downs are thickly strewn with tumuli, and other marks of an early population.

The entrenchments, too, are very interesting; and the advantage which has been taken of the natural ravines, to aid in forming camps, is very striking to the student of military antiquities. On the chalk hills north of Lambourn is the relic popularly known as "Wayland Smith;" and the country-people have a tradition of an invisible smith residing here, who would shoe a traveller's horse, if it was left here for a short time with a piece of money by way of payment. Sir Walter Scott has embellished this popular belief in *Kenilworth*.

In the great *Railway History* before us, we find this monument thus lucidly described: "Wayland Smith's Cave is a combination of a cromlech with a regular

Druidical circle. The circle is composed of between thirty and forty stones, some of which are overthrown and partially buried, while all are more or less displaced. Within the circle, three stones are set on edge, so as to form a chamber, which is roofed by a fourth. This is the cave. In front of the cave is a sort of cruciform alley of stones, two areas of which are closed at the ends, whilst the third is open, and forms the entrance to the cromlech. This curious relic stands by the side of the old Ridge Way: the stones are all grey-wethers, and similar to those of Abury, and the Trilithons of Stonehenge. The modern proprietor of this curious Druidical remain has had the good taste to plant a small wood of fir-trees around it, throwing the whole into a deep gloom, well suited to its ancient character."

Another relic, of kindred interest, may be mentioned here. This is the noted Blowing Stone, which stands some way up the hill, at the back of the village of Kingston Lisle, and about five miles from Wantage. It is a grey-wacke, and has in it several holes, into one of which, if a person blow powerfully, an extremely loud noise is produced, something between a note upon a French horn, and the bellowing of a calf, which may be heard at six miles distance. A probable tradition asserts it to have been employed as a Druidical oracle.

In this ramble among Druidical, Saxon, and Danish relics, we fear the reader will have *lost the train* of the narrative, at least; and so return we to the Railway at Shrivvenham, proceeding from whence westward, we arrive at the Bourton cutting, in deep blue clay, in which appears a bed of ammonites, some of them of large size. A little further on are found Deltoid oysters and septaria in beds of Kimmeridge clay, which, at the Stratton cutting, yields a rich harvest of fossils. Across this cutting is the first stone bridge on the line, carrying the Roman road from Cirencester towards Newbury.

The Railway now reaches the Swindon Station, seventy-seven miles from London, forty-one from Bristol, eighty-five and three quarters from Taunton, eighteen from Cirencester, thirty-three from Cheltenham, and thirty-nine from Gloucester by way of Stroud. Between Shrivvenham and Swindon, the village churches have some noticeable architectural features; and the antiquity of "Stratton" is told in its name, from "town in the Roman street."

Swindon lies on the summit of a hill about a mile south of the Railway; and it is scarcely possible to imagine a more beautiful view, alike attractive to the antiquary and the geologist. Towards the north and south it commands the chalk ridge, with its entrenchments and range of barrows, along which we have conducted the reader; "the scene, probably," says the *Railway History*, "of the early Celtic settlements, of the final struggle of that people under Arthur against the Saxons, and subsequently of some of the most severe contests between the Saxons and the Danes. This ground forms the northern limit of the immense plain of the chalk, extending from Avelbury to beyond Stonehenge, and including some of the most stupendous Celtic works now extant."

Swindon has been chosen as the great central depôt of the Railway, on account of its position intermediate between London and Bristol, and its being the point at which takes place the junction between the Great Western, and the Cheltenham and Great Western, railways. It is the principal depository for locomotive engines employed upon the Railway, as well as the stopping-place of all trains. In this respect it corresponds with the Wolverton Station on the London and Birmingham line. To show the importance of the position, too, prospective as well as present, we may here mention that, during the speculative mania of last year, Swindon was "the disputed railway territory," from the great number of schemes proposing to have connexion with the Great Western Railway, or to cross here with independent lines.

The Swindon depôt consists of a station-house for the

accommodation of passengers; and an engine-house and sheds for the safe keeping and repair of the locomotive engines. The passengers' station is double, and is placed on each side of the main line, here expanded to four lines of rails. Each station-house consists of three stages, the principal floor opening upon a spacious platform, protected from the weather, and upon which the passengers step from the carriages. The refreshment-rooms are superbly decorated in arabesque; the upper story is occupied as an hotel, sitting, and coffee-rooms on the south, and bed-rooms north; the communication between the two station-houses being by a covered gallery, crossing the Railway.

At some distance west of the passenger-station, on the north side of the line, is the engine depôt, capable of accommodating one hundred engines; for here every train changes its locomotive. The engine-shed is 490 by 72 feet, and will hold upon its four lines of rails forty-eight engines and tenders, a sufficient number of which are always kept ready with their steam up. The engine-house is 290 feet by 140; here the engines stand in compartments, as horses in the stalls of a stable; and in the centre is a travelling platform, fifty feet broad. North of the engine-house is the erecting-house, in which the parts of the engine machinery, when repaired, are put together.

"THE LOCOMOTIVE ENGINES in use upon the Great Western differ from those generally employed, chiefly in the dimensions of their wheels and framing, which are adapted to the broad gauge, and in the short stroke of their pistons as compared with the diameter of their driving-wheels, an arrangement intended to allow of a high rate of speed without an unfavourable increase in the motion of the parts of the machinery upon each other. All the engines run upon six wheels. In the passenger-engines the driving-wheels are seven feet in diameter, and the other wheels four feet. The length of stroke is eighteen inches, in the diameter of the stroke fifteen inches. The boiler contains 127 tubes. Each of these engines, when upon the line, and properly supplied with fuel and water, weighs about nineteen tons, and is calculated to exert a power equal to 120 horses, working at about forty-five miles in the hour. The tender following each engine runs also upon six wheels, and is constructed to contain about 1,600 gallons of water and twenty-five cwt. of coke."—(*Railway Hist.*) The carriages in use upon the line are not only broader than those running upon other railways, but they are also more lofty, and are all supported upon six wheels, the diameter of which varies from four feet to four feet six inches; it being one of the incidents of the broad gauge that it permits wheels of a very much increased diameter to be used with safety.

At the Swindon Station we see a change in progress which, in its development, will work a social transformation in the entire locality. Around the Station is fast rising a little town; the Railway Company and private speculators are building upwards of three hundred houses; the principal inhabitants of the place already being the men employed about the engines, persons of a superior class, both in intelligence and conduct. A library, reading-room, and mechanics' institute, have been established for this community. A large church, with 800 sittings, and a spire, 140 feet high, have been built at a cost of between 5,000*l.* and 6,000*l.*; and a parsonage and school-house, at 1,700*l.* A piece of ground has also been laid out as a park. To this judicious scheme of improvement, the Directors have very liberally contributed: they employ here from 300 to 400 mechanics, pay to their servants about 140,000*l.* half-yearly; and have expended upon their establishment here nearly 600,000*l.* Hence, they have a vast interest at stake; and in these provisions for the comforts of their servants, they have shown a wise and liberal policy. The rising town takes the name of *New Swindon*; and, though it may excite special wonder, for a moment, we must remember that the change corresponds

with what took place in this country upon the roads formed here by the Romans some sixteen centuries since; when stations rose rapidly to be villages and towns, and the *termini* were cities, or places of importance. These roads have lasted, in some places, to our times; and portions of railways are actually laid upon these old Roman ways.

Leaving Swindon, north of the line is Basset Down, once the residence of Maskelyne, the astronomer royal, and still possessed by his daughter, Mrs. Storey. In the opposite direction lies Lydiard Tregoze, the seat of the St. Johns, Earls of Bolingbroke, and Barons Lydiard.

We soon reach the Wootton Bassett Station, eighty-two miles and three quarters from London, and thirty-five and a-half from Bath. The town occupies the summit of a hill: it was once the inheritance of the Bassets of Wycombe; its first name being corrupted from Wodetoun, "Woodtown."

Leaving Wootton Bassett, the line enters a deep cutting, crossed by a bridge carrying the road from Malmesbury towards Cliffe Deppard. The Railway next passes at the foot of the hill

"Whence Brandon gently brings forth Avon from her source,
In her most quiet course which, southward making, soon
Receives the gentle Caln."

Bradenstoke Hill, crowned by the Decorated Priory (now a farm-house), rises almost immediately from the Railway. Adjoining is Clack Hill, with its earthworks, including a central mound for a beacon fire.

THE "TIMES" TESTIMONIAL.

THE following account of probably the most remarkable incident in the history of the newspaper press of this country, appeared in a late number of "Dolman's Magazine." The subject is itself so interesting as to be well worthy of a place in this Magazine, and is so well treated by the writer in Dolman, as to render any attempt on our part to improve upon it superfluous.

"In the month of May, 1840, a Brussels paper announced the detection of a most extraordinary fraud upon continental bankers, by the means of forged letters of credit, purporting to come from the London banking firm of Glyn, Halifax, Mills, and Co. The announcement was copied into Galignani, and in the same month the correspondent of the *Times* furnished that journal with fuller particulars of the affair, with portions of the correspondence of the perpetrators of the fraud, a correspondence which had been intercepted by the French authorities, and with the names of the conspirators; and among other names, that of Mr. Bogle, a banker of Florence, and the head of the banking firm of Bogle, Kerrieh, and MacCarthy of Florence. Upon this letter of its correspondent being inserted into the *Times*, Mr. Bogle proceeded to London from the continent, and his solicitor instantly served Mr. Lawson, the printer of the *Times*, with a writ in an action of libel, and made efforts to bring the *Times*, by the person of its printer, to an immediate trial. The *Times* might have put in other pleas in answer to the declaration of libel, but it preferred to plead justification; that is to say, to stand to the correctness of its correspondent's report, and to maintain that the assertion was true, and that Mr. Bogle was one of the perpetrators of the fraud. Of course, to bear out this plea, a great body of evidence was necessary. The fraud was at that time vaguely, but only vaguely, understood; the foreign bankers who had suffered by it, as well as the governments in whose states it had occurred, seemed anxious at first to hush it up, and consequently great exertions and an enormous outlay were necessary, before the *Times* could possess itself

of those particulars which were alone able to justify it in a court of justice, and which we shall presently detail in a succinct form to the reader. Suffice it at present to say, that the determination of the *Times* to obtain those particulars was in a great measure crowned with success; that Mr. Dobie, its solicitor, and Mr. Kirwan, a barrister, were sent by that journal to various parts of the continent; that commissions were sued out to examine witnesses abroad, in spite of the efforts of the plaintiff—efforts which there is every reason to believe were backed by the very money which he and his associates had plundered—and directed and advised by the ingenuity of one of the other conspirators, who is said, for the purpose of tendering his aid and his funds, to have come in secret to London.

When the *Times* had obtained all the evidence that it was possible, under very disadvantageous circumstances, to obtain, the trial came on, at the Surrey Assizes, on the 16th of August, 1841. Those who remember the masterly efforts made by the counsel on both sides; the ingenious endeavours of Sir Frederick Thesiger for the plaintiff, and the calm sagacity of Sir William Follett for the defendant, cannot doubt that the case was, as far as circumstances allowed, thoroughly sifted. Chief Justice Tindal, memorable for his judicious and impartial examination of every fact that was laid before him, summed up, and the jury brought in a verdict against the *Times*, but a verdict of one farthing damages only; thus testifying sufficiently, that, although the strictly legal evidence did not allow them to give a stronger testimony against the criminality of the plaintiff, they were resolved not to give him more than the strictness of technical rules, which had won him this disastrous victory, obliged them to give. On the verdict being announced, Sir Frederick Thesiger called upon the judge, as is usual in the case of small damages, to certify that the plaintiff was entitled to his costs. This was refused, and the plaintiff accordingly had the poor consolation of having won by his action one farthing to compensate for immense costs, and of having received from a jury of his countrymen the strongest mark of reprobation that the imperfectness of the evidence allowed them to express.

On the other hand, the *Times* had to pay its own costs, which were said to amount to something like five thousand pounds; and, as this heavy outlay had been encountered not certainly through any interested motive, the merchants of London, and of most of the continental countries, determined to compensate that journal, and to mark, moreover, their signal admiration for the course which it had pursued. A meeting was therefore held at the Mansion House, on the 1st of October, 1841, for the purpose of considering the most eligible mode of thus testifying their acknowledgments. At this meeting all the principal merchants of London were present, and several foreign bankers. Respecting the resolutions moved at that meeting, the *Times* spoke the next day, in a leading article, in the following characteristic style:

"A present of plate was spoken of as an indemnity of our heavy expenses. The liquidation of these we know would be nothing, if undertaken by gentlemen so numerous, of such wealth and importance, acknowledging such services. But no, gentlemen; ever honoured by us will you be for these intentional testimonies to our merits; but we could accept nothing from you—nothing but your esteem, and any memorial of that which your sense of public duty might suggest. But our funds must not be augmented by one farthing, nor any additional splendour be added to our establishment, by a donation of a farthing's value. The surest pledge of the continued independence of the journal is its freedom from all pecuniary obligation; that it shall certainly retain; and your simple approbation, however otherwise evinced than by those methods which we respectfully decline, will be the best encouragement to others to pursue our course. By such a public display as this in our favour, future journalists will know, and we hope

will endeavour to pursue, the same honourable path to fame which has been successfully trodden by the *Times*. The meed of your approbation, gentlemen, will exert itself beyond the present race; and, while you thought only of conferring a favour upon us, you will be found to have benefited your country, and excited the love of an honest and independent course in the hearts of men yet unborn.

In consequence of the refusal of the *Times* to accept of any compensation, the subscription which was raised was devoted to an object not certainly so profitable to the conductors of that journal, but inconceivably more honourable; and, in fact, constituting in itself an event in the history of the press. Of the subscription itself, we may mention that it arose from contributions from all parts of the world. The contributors may be described as follows:—thirty-eight public companies; sixty-four magistrates and officers of the corporation of London; fifty-eight London bankers and joint stock banks; one hundred and twenty-nine London merchants, manufacturers, and traders; one hundred and sixteen country bankers, manufacturers, and traders; twenty-one foreign bankers, merchants, and public companies; and one hundred and twenty-nine from individuals or anonymous sources. The subscriptions from foreign bankers, merchants, and public companies, were from Alexandria, Antwerp, Cadix, Calcutta, Cologne, Dantzic, Florence, Geneva, Hamburg, Lagunayra in South America, Macao, Malta, Messina, Naples, Newfoundland, Ostend, Paris, Vendée, Veray, and Wiesbaden. The contributions were limited to ten guineas in the case of firms, and to five in the case of individuals, and the whole subscriptions amounted to 2,700*l*. Of this sum nearly 1,800*l*. was invested in the purchase of 2,000*l*. three per cent. Consols, in the names of the Lord Mayor, the Bishop of London, the Governor of the Bank of England, and the Chamberlain of the City of London, all for the time being; the dividends to be applied to the support of two Scholarships, to be called 'The *Times* Scholarships,' in connexion with Christ's Hospital and the City of London School, for the benefit of pupils proceeding from those institutions to the University of Oxford or Cambridge; and one hundred and fifty guineas were expended in the erection of a commemorative tablet in the New Exchange, and a similar one at the *Times* printing establishment, and tablets commemorative of the 'Times Scholarships' were placed in the grammar school of Christ's Hospital, and on the principal staircase of the City of London School. Such were the steps which the commercial community considered it right to take in this matter, and on the 2nd of September, as we have said, they wound up the proceedings by a sumptuous entertainment to the proprietors of the *Times*.

We shall now give some particulars of that conspiracy which called forth the exertions of the *Times*.

In the strange mixture of the gay society of Florence, there were, between the years 1832 and 1840, two individuals who formed in their own characters a kind of link between the aristocratic refinements of the fashionable people gathered together in that city, and between the rogues who generally follow in their train. The one was the Marquis de Bourbelle, a Frenchman, and the other Cunningham Graham, of Gartmore in Scotland, and formerly member of Parliament for Stirling. The characteristics of these individuals belong more to the rogues of fiction than to what would have been conceived to be reality. The Marquis de Bourbelle was, according to his own account, of excellent family. His family was like that of Barras, 'as old as the rocks of Provence.' It is said, however, that he was a member of the small gentry of Normandy, and that his father filled a subordinate situation in the suite of the Marquis of Hastings, when that nobleman was governor-general of India. When young, Bourbelle was attached to the French mission at Florence, and afterwards to that of Copenhagen. Subsequently he killed in a duel a Mr. Haidé,

a gentleman of Greek extraction. After this duel he got into bad repute, became a gambler, a duellist, and a confirmed roué, and was some time a member of the secret police of France. On the other hand, he is described as a man possessed of many accomplishments. He spoke several languages, and his English letters, in spite of an occasional incorrectness, show a great familiarity with the English language. He was known for his taste in the fine arts, was an excellent draughtsman, rode, fenced, boxed, and intrigued, and was universally looked upon as a specious, agreeable rascal. Early in 1838 he eloped from Florence with his wife's maid, and the former, an Englishwoman, died broken-hearted in childbirth. This transaction threw De Bourbelle into such very bad repute that he was obliged to leave Florence, and he accordingly retired with his family to Villa Micali, a country-house near Leghorn, on the Florence road. There, however, he did not remain in solitude, for he was often visited by Cunningham Graham, a man scarcely less remarkable than himself in his own way.

Graham was of really good family, and had been of good estate. He had disgraced the one, and had lost the other. He had left Scotland in 1828, to escape from his creditors, and after residing for some time at Brussels, he at length, in 1832 or 3, settled in Florence, where he met Bourbelle, who came to that town a year afterwards. Graham was described as a singularly remarkable man; he did not yield to De Bourbelle in taste for the fine arts; he was possessed of much reading and a vigorous mind, which had been improved by cultivation. More cool than De Bourbelle, he was, however, like him, crafty, designing, and thoroughly unprincipled. His chief excellence was in the imitative and mechanical arts. He was a first-rate turner and mechanic. He formed and fashioned his own tools with surpassing ingenuity, and had invented a contrivance by which he was able to trace copies of not only the rarest engravings of Raphael Morghen, but the choicest masterpieces of Domenichino and Guido Reni. He soon discovered, however, that this contrivance might answer a more profitable purpose, that of counterfeiting, with astonishing exactness, the signature of bankers.

Cunningham Graham had married a Mrs. Bogle, and he was not long in Florence before he was joined by her son, Allan George Bogle, who became afterwards so well known by his action against the *Times*. Bogle was a native of Glasgow, and the son of a West Indian merchant of some eminence. He had entered life in the navy, and risen to the rank of lieutenant, and was at the time of which we speak on half-pay. At Florence, he became, in 1834, and probably at the suggestion of Cunningham Graham, clerk to Mr. Johnstone, a banker in that city, and on the failure of the latter in 1837, Bogle set up as a banker on his own account. He was not, however, very long in this isolated position, for in the November of the same year he entered into partnership with Messrs. Kerrick and MacCarthy as principal partner.

Whether Bogle was an original member of the conspiracy in which he and Graham and Bourbelle afterwards took so signal a part, it is not easy to ascertain. It is more probable that he was at first made an unconscious tool by the other two, who disclosed their plans to him only when they were ripe for execution.

To Bourbelle and Cunningham Graham it appears very soon to have occurred that the mechanical instrument of which we have spoken could be turned to some advantage; for they spent much of their time together, principally in Graham's turning-room, as is to be presumed, concocting and perfecting their plans. In such meditations they appear to have come to the conclusion that a fraud unparalleled in its magnitude might be successfully perpetrated upon the bankers of the Continent, by which the conspirators might clear about a million sterling. Once possessed of this sum, they proposed to escape to America, India, and other parts of the world.

The means which they proposed to use were circular letters of credit.

Circular letters of credit, with which most continental tourists must be familiarly acquainted, may be described as orders for a certain sum of money to be received wholly or in part at one or at several of the continental bankers, correspondents of the London banker, who gives the letter of credit, in consideration of a certain sum lodged with him. The firm, whose letters of credit the present conspirators selected, on account of the magnitude of its transactions, was that of Glyn, Halifax, Mills, and Co., London bankers. The letters of credit of this firm are like those of other west-end bankers. Stamped on them are the initials of the firm; beneath is a blank space for the payments, which are marked off as they are made on the Continent, until the sum for which the letter of credit is given is entirely exhausted. Annexed to, and forming a part of the letters, are the names of the principal towns of Europe, beginning with Abbeville and ending with Zante, and opposite to each town the correspondent of Glyn and Co. in each respective place. And thus, with a letter of credit for a thousand pounds, one may obtain the whole sum at any of these places, or portions of the sum at each of them.

Bourbelle and Graham, having settled on the object which they had in view, had two things to do in order to effect it. It was necessary for Graham to obtain, in Florence, a circular letter of Glyn and Co., from which he might copy, by the means of his machine, the signature, which stands out *alto relievé*, thus: 'G., H., M., and Co.' This could alone be effected by Graham's machine. On the other hand, it was necessary to obtain a circular letter also, from which to print off fac-similes of the engraved portion of them, and in no place on the Continent could the printing be safely done; London was therefore fixed upon as the proper locality for that operation. For the first of these operations, it would appear, that Graham had obtained from Bogle an old circular letter, belonging to a gentleman of the name of Robert Nicholson; and it is improbable that, without this copy first to try his skill upon, they would have proceeded to the printing. It was, however, quite sufficient to afford Graham the signature of Glyn and Co.; and this obtained, the only part wanting in the operation was, to have the copper-plates of the printed portion of the letters engraved. There was also something else wanting,—that is to say, instruments to put the fraud into execution; for the principal conspirators were anxious not ostensibly to take a part in the transaction. With both these ends in view, Bourbelle came to London.

In London, Bourbelle soon fell in with an old friend of his, a person of the name and title of Baron D'Arguson. At the time, the Baron lived by gambling; he was, however, the son of Count D'Arguson, a peer of France, President of the College of Electors of the department of Eure, and First Chamberlain of Hortense, wife of Louis Buonaparte. To the Baron, Bourbelle, on the 7th of January 1840, gave 150*l.*; and the Baron, having lodged that money with Glyn and Co., obtained from them a circular letter of credit for the amount. Thus was the object answered of obtaining a copy from which to strike off the copper-plates; for it was impossible to remove from Florence the letter of credit belonging to Mr. Nicholson, from which, as we have seen, Graham had copied the signatures. It appears, however, that the conspirators were singularly economical in their proceedings; for, before putting the letter of credit to the use for which they intended it, they sent it over to the Continent, and obtained the whole of the sum for which it had been given, with the exception of five pounds. It was afterwards remarked, as a coincidence, that the same partner who signed the letter of Nicholson, signed the present one,—that is to say, Mr. Halifax, jun., whose exclusive province it by no means was to sign the letters of credit. From this circumstance, it would have been not at all improbable that, even had

the conspirators not been early disturbed, as we shall presently see, in the execution of their scheme, some suspicion might have been excited by their letters of credit invariably bearing the same signature.

Matters having so far proceeded, a sufficient quantity of the peculiar paper upon which Glyn and Co. print their circular letters was obtained, with some difficulty, from a paper manufacturer; and Bourbelle, and his friend D'Arguson, set about the matter in earnest. A printer was engaged. At first he worked in his own office, near the Haymarket; but subsequently, Bourbelle, who objected to the intrusion of strangers, induced him to come and work at his own lodgings, at 184, Regent-street, where he resided on the top floor. The circular letter was given to the printer, bit by bit; and he was never allowed to have two portions of it at the same time, until the copper-plate was completed, when he could not but suspect, as he acknowledged at the trial, that there was some fraudulent purpose in the affair; being well paid, however, he held his tongue. When the copies had been struck off, they were forwarded by Bourbelle, with great care, to Cunningham Graham, at Florence, and the latter traced upon them the signature of Glyn, Halifax, Mills, and Co. They were afterwards distributed among the members of the conspiracy, according to the directions of Bourbelle, and according to the amount which it was arranged that each member should levy upon the bankers of the Continent.

Thus far Bourbelle's measures had been successful; and upon them he appears to have spent considerable sums of money; but there was still one difficulty remaining,—it was the want of proper instruments to put the whole scheme into play. As we have said, it was no part of the plan that the principal conspirators of the plot should be actors in it; it was therefore necessary to find some individuals who, for a per centage on the profits of the chief worthies, would consent to present the circular letters in the various towns of the Continent. This was no trifling difficulty; and we shall see that it was owing to the ill-judged selection of one individual that this nefarious plan was brought to so early a close.

The parties whom Bourbelle selected were the following:—

1^o. D'Arguson, who was to travel under the name of Castel.

2^o. Marie Rosalie Desjardins, the mistress of D'Arguson, who was to travel under the name of the Countess De Vaudec.

3^o. A person of the name of Frederick Pipe, who was to travel under the name of Dr. Coulson. This man is said to have practised originally as a veterinary surgeon, but to have been, at the time that Bourbelle fell in with him, connected with one of the gambling-houses in the Quadrant. Another account makes him out to have been formerly in the service of a Dr. Coulson, whose name he now assumed. Be his early education what it might, we shall presently see that he certainly was one of the most accomplished swindlers of the party.

4^o. Charlotte Anne Pipe, said to be the wife of the last, and who was to travel under the name of Lenoy.

5^o. Alexander Graham, the son of Cunningham Graham, and who was to travel under the name of Mr. Robert Nicholson. This young man appears to have been one of the most worthless of the whole gang, so much so that he excited the utmost solicitude in the bosom of his worthy parent, whose letters, reminding him of 'honour,' and exhorting him not to act in an 'unprincipled manner,' are not unworthy of notice. Even Bourbelle appears to have distrusted young Graham completely. However, their misgivings were not entirely borne out, for he appears never to have exerted himself, for good or for ill, more than to obtain 150*l.*, with which to live pleasantly at Aix-la-Chapelle, whilst his companions were acting more industriously in other parts. Before the trial of *Bogle v. Lawson* came on, young Graham had died of a loathsome disease, in a maison de santé, near Paris, in want and misery.

60. The sixth individual whom Bourbelle selected was a man styling himself Charles Gerard, Count de Paindry, but from what source he had obtained this title of nobility it would not be very easy to ascertain.

70. The seventh was T. W. Perry, alias Ireland, who did not speak French.

Every thing being in readiness, it was agreed that proceedings should commence on the 21st of April, simultaneously, in Italy, in Belgium, and on the Rhine. Alexander Graham, who had been residing at Florence with his father, left that city for Aix-la-Chapelle, whither the other conspirators, with the exception of Bourbelle and Pipe, (alias Dr. Coulson,) starting from London on the 1st of April, repaired to join him. In the mean while Bourbelle and Dr. Coulson proceeded, *via* Paris, to Italy. At Nice, these latter were met by old Graham, who, it would appear from the letters intercepted by the French police, declared the letters of credit to be perfection, and that it would be impossible to refuse them. The following letter, from Bourbelle to D'Argusson, will give an idea of their plans at that moment, as well as of the character of the man:—

‘ Here at Nice, April 13th.

‘ Neither Coulson, Graham, nor myself have received anything from you; no letters, from which I conclude that all is tranquil with you at Aix-la-Chapelle. May God preserve you in peace up to the 21st. I leave them here to-morrow, but with orders to act, if they receive from you a letter telling them to do so, sooner than the period fixed upon; but I hope that they will not receive any letter from you, and that all will go on quietly. Do not commence, without having given them notice, before the 21st, otherwise you would cause them to be taken in the middle of Italy; but you are aware of that, and you are incapable of baseness. Adieu, dear. You will find at the post-office of Milan a letter for you from me, under your name D'Argusson. It will tell you where I advise you to go when you have done at Milan. I think I shall tell you: go to Venice and Trieste, in order thence to reach Egypt and India; and until you have been able to reach India, drop there all trace of you; abandon your passport, and embark there for America, without any other name than that of Castel, and to return quietly do not stop. You could go from Trieste to Corfu, and there cast your skin, and do not enter Ancona; but I advise the grand flight. Adieu again: embrace you. In your misfortune I have been a brother to you; be mine now. My fortune, my happiness, my ruin is in your hands.

‘ BARON LOUIS D'ARGUSSON, Poste restante, Paris.’

From Nice also Bourbelle wrote to Alexander Graham on the 14th that all was right, and ‘a proof that all is right is, that Bogle lets old Graham come and embark in the affair. Bogle and your papa are convinced that all will turn out well, and that the letters of credit must be paid.’ This paragraph formed a portion of the evidence against Bogle on the part of the *Times* at the trial, and though insufficient as a complete proof of the criminality of the former, it was, with the other evidence, quite enough to satisfy the public of his criminality.

At length the 21st of April arrived. By this time De Paindry had arrived in Florence, and on his side also so had Bourbelle. On the morning of that day De Paindry presented himself at the bank of Bogle, Kerrick, and MacCarthy, and presented a letter of credit, upon which he asked and received 200*l*. It would appear that later in the day De Paindry attempted to get a further advance on the same letter, from an English shopkeeper in Florence, who expressed, remarkably enough, some doubts as to the genuineness of the letter; for, in the course of that day, Bourbelle came to the bank, and had a long interview with Bogle, in the private room of the latter, and with locked doors. In this interview it is presumed that they decided that it would be wiser that De Paindry should return the money, as

otherwise the whole affair might be blown upon at the very outset. Be this as it may, De Paindry returned to the bank the next day, and mentioning the suspicion of the shop-keeper, insisted on returning the money, adding that ‘*lorsque l'honneur est blessé mortellement, on ne doit point songer à garder aucune mesure.*’ Having thus succeeded in destroying all chance of an alarm being created at Florence, De Paindry proceeded to Venice, and on the 24th obtained 374*l*. on the same letter of credit, on which Bogle, Kerrick, and Co., had marked the cancelment of their payment, at the request of De Paindry, and on the 25th 40*l*. more from the brothers Dubois. From Venice he proceeded to Trieste, and on the 29th obtained 1612*l*. 6*s*. from Mr. Richard Routh, who was so delighted by his agreeable manners and conversation, that he invited him to dinner, and gave him the use of his opera-box in the evening.

In the mean while, at Genoa, on the 21st, Frederick Pipe (alias Dr. Coulson) presented to Gibbs and Co. a letter of credit for 2000*l*., requesting 1500*l*. on it in gold, in order to purchase works of art. Next day he presented at Turin another letter of credit to Nigra and Son, and obtained 600*l*. on it. Proceeding to Milan, he obtained on the 23rd, in that city, 800*l*. from Pasteur Girod and Co. on another letter of credit. On the 24th he obtained again 800*l*. from Louis Laurent and Co., at Parma. Thence Graham and Pipe (for it is observable that the minor, or rather acting conspirators, were for the most part accompanied by one of the original projectors, who are supposed to have received the greater part of the spoils) proceeded to Rome, and passing at Villa Micali, met Bourbelle, who had allowed De Paindry to proceed by himself. It is supposed that at Villa Micali they divided their spoils, and that Bourbelle received a considerable share; for it was ascertained by the register of the Police, that he was in Florence on the 28th, and the banker Treppa acknowledged to having received from him 1700 Napoleons on that day.

On the 28th, the self-styled Dr. Coulson and his friend Graham were in Rome. The former called upon M. le Mesurier, and obtained 200*l*. on a letter of credit for 2000*l*. Shortly afterwards he returned again and demanded 1800*l*. more. M. le Mesurier, as it was the first time that he had honoured any of Glyn and Co.'s letters of credit, hesitated to make this second advance. Upon this Coulson flew into a furious rage, told him that he had come over to execute a commission for his father, and that if the money was not immediately paid, he should return the 200*l*. he had already received, go back to England, and that his father would bring an action against Glyn and Co., not only for the expenses of the journey, but for damages besides. On consideration, therefore, and after consulting the English consul and another gentleman, M. le Mesurier paid the money.

The conspirators, who had assembled at Aix-la-Chapelle, had all, with the exception of Alexander Graham, left it before the 19th, some of them, as we have seen, to proceed to Italy. Alexander Graham contented himself with obtaining 150*l*. from a banker in Aix-la-Chapelle, and after that remained inactive. The Countess de Vaudec (alias Rosalie Desjardins) on leaving Aix-la-Chapelle, proceeded in style up the Rhine, in an elegant carriage, with a courier. Her only companion was a little girl. At Cologne she presented, on the 22nd, a letter of credit for 800*l*. to Oppenheim, jun. and Co., and demanded and received 500*l*. upon it. At Coblenz, on the 23rd, she obtained from another banker, and on a fresh letter of credit, 500*l*. more. On the 24th she presented another to Gogel, Koch, and Co., and obtained 520*l*. upon it. At Mayence she presented another to Human and Mappes fils, and having obtained 500*l*. more, she proceeded leisurely to Paris.

But whilst the master-spirits of the party were carrying on the scheme with such eminent success in Italy

and on the Rhine, the stupidity of one of their confederates was ruining De Bourbelle's hopes of an *El Dorado* in Belgium.

On the 20th of April, D'Arguson, who passed under the name of Baron de Castel, started with Perry (alias Ireland) from Aix-la-Chapelle for Liege. Once there, the Baron, who does not seem to have had a very great confidence in his companion, took the latter towards the bank of Nagelmaker and Cerfontaine, and in the very street in which those bankers lived, handed him a letter of credit for 800*l.* and directed him to ask for 550*l.* Upon this demand being made by Perry, it was refused, owing to his passport not being regular. Next day, however, he returned, and induced them to give him 100*l.* upon it. Out of this sum D'Arguson took 80*l.* and gave him the remainder. They thence proceeded to Brussels, and presented to Engler and Co. a letter of credit for 1400*l.*, on which they asked and obtained 750*l.*; out of this sum D'Arguson took 500*l.* At Ghent, on the 23rd, they presented a letter to Meulemerte and Son, but without success; these bankers objecting that they had not received a letter of advice. Later, on the same day, Perry, in company with the woman Lenoy, (alias Pipe), went to Antwerp, and presented to Mr. Agié the same letter on which Mr. Engler of Brussels had advanced 750*l.* The appearance of Perry excited some suspicion in the mind of Mr. Agié, and, when the former stated that he was about to return to England, the wonder was still greater, that such a man, after the receipt of so large a sum in Brussels, should require more money, and that when on the point of starting for England, from which the letter of credit was supposed to come. Mr. Agié refused, therefore, to make any advance, on the plea that he had received no advice. No sooner had Perry left him, however, than he wrote to Mr. Engler, suggesting that there was something wrong, and Mr. Engler sent immediate directions to have Perry arrested. Perry was accordingly arrested, with the woman Pipe, on board the Ostend steamer, when on the point of starting for London.

The depositions of Perry before the Belgian authorities exposed the whole matter, as far as he was connected with it. But, in the mean while, a premature announcement of the fraud made in the Brussels paper gave the alarm to the confederates, and they all succeeded in making their escape. It is true, that De Paindry was overtaken in Moldavia, obliged to disgorge a portion of his plunder, delivered up by the summary police of Constantinople, sent to Genoa, and thence to Aix-la-Chapelle, but there the court declared its incompetence to take cognizance of the matter, and he was dismissed. Graham the elder, D'Arguson and his mistress, or Pipe, do not seem to have been in any way molested. Bourbelle retreated to Spain, but it is asserted that he came expressly to London to support Bogle against the *Times* with his money and his advice, and that he was in London at the time of the trial. Pipe, after escaping to Malta, and remaining there four days, started for Bona in a Maltese Lombarde, and having there made friends with the English consul, and with the governor, changed his passport, and proceeded to France *via* Algiers.

On the 9th of May the depositions of Perry at Ostend reached Florence, and Bogle withdrew of his own accord from the firm of Bogle, Kerrick, and Maccarthy. Not making an attempt, however, to clear his reputation, he was, by a decree of the Tuscan government, expelled from Tuscany—a stigma from which the circumstances elicited in his action against the *Times* did not certainly in any way relieve him.

Such is a brief account of the facts connected with the famous conspiracy, by its elucidation of which the *Times* has rendered all similar conspiracies utterly impracticable."

Biographical Sketches of Eminent Painters.

RUBENS.

PETER PAUL RUBENS was born in the year 1577, at Cologne, whither his parents had retired from Antwerp in order to avoid the calamities attendant on the civil wars, by which, at that time, the Low Countries were disturbed.

His father, John Rubens, was a doctor of laws, and was much respected in Antwerp, where he repeatedly filled important public situations in the most honourable manner. Peter Paul gave signs of great natural talent from his earliest years. His father gave him a superior education after his return to Antwerp; and so apt was he in attaining knowledge, that when very young he could converse fluently in the Latin tongue.

He was a handsome boy, and was, for a short time, page to the Countess Lalain; but he soon became weary of that effeminate mode of life, and returned home. After his father's death, which took place at about that period, his inclination for painting became so marked, that his mother engaged Tobias Verhaecht, a painter of landscapes and architectural subjects, to give him instruction in that art.

He afterwards became a disciple of Adam Van Oort, a painter of but ordinary merit, and of so morose a temper, and of such incorrect morals, that young Rubens soon resolved to cease to be his pupil, and went to study under Octavio Van Veen, more generally known as Otho Venius, a painter who was as much admired for his talent in his art, as he was respected for his learning and excellent moral character. Rubens profited by the advantages he possessed, and pursued his studies under the guidance of this superior man with enthusiasm.

At the age of twenty-three he determined to visit Italy; and the Archduke Albert, Governor of the Netherlands, gave him the strongest letters of introduction to the Duke of Mantua, in order that he might have every facility for studying the admirable paintings and antique statues in his collection. The Duke received him with every mark of distinction, and soon became much attached to him; so much so, that he sent him on a mission to Philip the Third, King of Spain, which Rubens fulfilled in so satisfactory a manner, that both the Spanish monarch and the duke bestowed on him the most marked testimonials of their regard.

After his return to Mantua, he visited Rome, Venice, Genoa, and other Italian cities, where he studied the works of the great masters, and improved himself in colouring by his accurate observation of the style of Titian and Paul Veronese. It has been said that he did not sufficiently refine his taste by the study of the antique, as most of the celebrated artists had done; nevertheless, the fame of Rubens spread in a few years throughout Europe, and no painter's works were ever more universally coveted and admired than those of Rubens.

His great talents were eagerly demanded for the adornment of churches, the palaces of sovereigns, and the mansions of the noble and wealthy of all nations; whilst by his learning, his courteous manners, and amiable disposition, he obtained the friendship and patronage of the kings of England and Spain, and other monarchs. He was even com-

missioned by the King of Spain to proceed to England to make overtures to Charles the First for a treaty of peace—a mission which he fulfilled in the most satisfactory manner. The King of England bestowed every mark of consideration on Rubens; and having engaged him to decorate some of the apartments at Whitehall with his paintings, his Majesty conferred on him the honour of knighthood, as a public acknowledgment of his merit.

The talent of Rubens for allegorical compositions is displayed in a remarkable manner in his paintings in the palace of the Luxembourg at Paris: they are emblematical of the life of Mary de Medicis, Queen Consort of Henry IV. King of France. His landscapes are painted in the happiest style, and he possessed equal talent for painting animals. As his works were so eagerly sought after, he instructed a number of young men of genius, who assisted him in the execution of his designs. Vandyck and Snyders were among the number of his pupils.

In his house at Antwerp this princely artist had for his studio a circular apartment, with a dome—a miniature of the rotunda of the Pantheon at Rome—where the light, descending from an aperture or window at the top, produced a uniform and pleasing effect on the objects beneath. In this favourite studio or museum Rubens had collected a vast number of books, marbles, statues, cameos, intaglios, or engraved stones, and a variety of the riches of art which he had collected in Rome. The walls were covered with pictures either of his own composition, or copies, by his own hand, made at Venice and Madrid, of the works of Titian and Paul Veronese. All foreigners, literary men, or lovers of the arts, and even princes who might be passing through Antwerp, visited Rubens, and inspected his valuable studio. He eventually disposed of his collection to the Duke of Buckingham for a hundred thousand florins; but he stipulated that he should be permitted to take casts of the statues, &c., which were deposited in the place where the originals had stood.

Rubens was twice married; and he had several sons. The eldest filled a high office in Antwerp; and the others were still young, when their father died, at the age of sixty-three, in the month of May, 1610, at Antwerp. He was an admirable artist, an accomplished scholar, and a most amiable and excellent man. His body was interred in the parish church of St. James, of Antwerp, where his epitaph may be seen.

In the church of St. Peter, at Cologne, is the celebrated picture, by Rubens, of the martyrdom of St. Peter. It was a present from this great painter, who was baptized in that church. This picture was taken to France during the empire of Napoleon, and was sent back to Cologne after the restoration of the Bourbons.

The "Descent from the Cross," in the cathedral of Antwerp, has been considered superior to the above-mentioned picture.

The "Incredulity of St. Thomas" is a very fine picture. The subject will be found in the twentieth chapter of St. John. The figures are of the natural size.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE LANDLADY'S DAUGHTER.¹

THESE came three students over the Rhine—
 Dame Werter's house they entered in:
 "Dame Werter, hast thou good beer and wine?
 And where's that lovely daughter of thine?"
 "My beer and my wine is fresh and clear—
 My daughter is lying cold on her bier."
 They ~~opt~~ within the chamber of rest,
 Where shrouded lay the maiden, in black robes drest.
 The first he drew from her face the veil;
 "Ah! wert thou alive, thou maiden so pale,"
 He said, as he gazed with saddened brow,
 "How dearly would I love thee now!"
 The second, he covered the face anew,
 And weeping, he turned from the view:
 "Ah me! that thou liest on that cold bier,
 The one I have loved for so many a year!"
 The third once more uplifted the veil,
 He kissed the lips so deadly pale;
 "Thou loved I *ever*, still love I thee,
 And thee will I love through Eternity."

From Uhland.

THE BLIND GIRL.

BY ANNE A. TREMONT.

DARKNESS where'er I go!
 Nor earth, nor sky, nor blessed light for me,—
 But a deep yearning woe
 For the bright things I never more may see,
 But which, like lovely phantoms, still remain,
 Haunting the veiled chambers of my brain.
 And, when kind words are spoken
 Like holy breathings from a world unseen,
 My heart is well nigh broken,
 To think that it can only darkly dream,
 What form may wear the sweet-ton'd instrument,
 Where Love hath rail'd his gentlest music blent!
 Yet memory still is mine,
 And what lost treasure it gives back again;
 My girlhood's happy time—
 The forms and faces so familiar then;
 And, shining like a star through my dark night,
 Is one, who was as dear to me as sight.
 It is before me now,
 Wearing the looks I lov'd so to behold;
 The same calm thoughtful brow,
 And loving smile, that ne'er for me was cold:
 'Tis mid my desert a fresh lovely spot,
 And one which even blindness withers not.
 But oh! to feel how vain
 The hopes which came around us like sweet flow'rs!
 It almost sears my brain,
 To think through life such will no more be ours;
 Yet is it but the wreck of earth's frail bark!
 Father of Light! let not my *soul* be dark!

STUDENT LIFE IN GERMANY.

THE JOBSIAD.

In a former paper we promised some account of the Jobsiad, a mock heroic poem, intended to illustrate certain peculiar features of German Student life; which promise we now proceed to fulfil. It contains the adventures of Hieronimus Jobs, a student of theology, who, having achieved great fame at college, as what in England would be called a "rowing man," that is, a thorough "Bursch," is unable to pass his examinations as candidate for holy orders, and is obliged to take up the profession of night-watchman, in which situation the powerful voice which he had acquired by frequent singing of student songs, enables him to give great satisfaction. The whole story is told in a sort of slang doggerel verse, which it is difficult to give an idea of, and

adorned with wood-cuts, not the most *recherché* either in design or execution; but the author apologizes for the shabbiness of his illustrations by the cogent reason—

"That though the pictures are not the neatest,
The verses also are not the sweetest;
For this I considered good and wise,
That one with the other might harmonize."

The epic commences with an account of the parentage, birth, and early years of Hieronimus, showing how he was sent to school and learnt nothing there; how his father and mother, discovering in him the certain signs of great genius, wished him to be a clergyman; how his master endeavoured to persuade them to the contrary; and how they, reassured by the prognostications of a gipsy, and indignant at the teacher's calumnies, finally sent Hieronimus to the University.

"Our hero no sooner arrived, as stated,
Than he was *stulte pede* matriculated,
And from this time forth, of course, was he
A laborious student of theology.
But though in arrival one of the last men,
He very soon showed himself one of the fast men,
Spending frugely, and living fast,
While the useful time of his youth flew past;
And his conduct as student was very fair,
Considering he'd been such a short time there.
He very soon learned with the best of the band
To drink and to smoke in the gardens at hand;
He lived on wine, and tobacco, and beer,
And long and loud his voice you might hear,
And the welkin far with his accents rung
When the "*Gaudeamus*" he nobly sung.
To become a thorough Bursch was his aim,
And he soon acquired quite a deathless fame,
And every one pointed him out to see
The model of what a student should be.
He hated the Philistines¹ worse than the devil,
Did them in all ways all sorts of evil,
Beat them sometimes in glorious fight,
Broke their windows often at night;
And, in spite of the rector's and beadle's frowning,
Was always the foremost in any renouncing.²
On fresh young foxes³ he loved a joke,
And laughed when they sickened in trying to smoke.
The most of his time he spent over his beer,
But, by way of a change, in the class would appear
About once in two months, so that no one could say
He was idle, or wasted his time away."

And so the author goes on describing the heroic life of a true German student; and then, as Hieronimus begins to fall short of money, we have a letter from him to his parents, giving a faithful account of his doings at College.

"Dear parents, with pain I am forced to avow
That I'm greatly in want of some money just now;
Do me the favour, then, I pray,
To send me a trifle as soon as you may;
That is, some thirty ducats or so,
For I don't wish to ask too much, you know,
Since everything is so dreadfully dear —
Then send, if you please, the money here.
Yes, everything, washing and lodging here,
Food and candles, is dreadfully dear,
And sundries of every kind almost;
So send the cash, by return of post.
I'm sure you cannot at all comprehend
What a lot of money I'm forced to spend,
What with books and with college fees, —
So send me the ducats, do, if you please.
I study tremendously every day —
So send me the thirty ducats, I pray,
As soon as you can, for I see, with woe,
That my money is running terribly low.
Linen and boots, and gloves and hose,
Shoemakers, tailors, washing and clothes,
Pens and ink, paper and pencils, too,
Cost very much, — send me the ducats, do.
The cash, which I hope will be speedily sent,
Shall be, I promise you, properly spent.
Yes, dear parents, I live, I swear,
With the very greatest prudence and care;
Whilst other students are drinking and bawling
I withdraw myself from their riotous bawling,
And alone with my books, in my study small,
I shut myself up, apart from them all.
Except the most needful clothing and food,
I've been saving in every way that I could,
And never drink anything stronger than tea,
For to waste your cash would be shocking to me.
The rest of the students, who revel and riot,
Begin quite to hate me for being so quiet,
Saying, 'Look, how the miser *sittes* there,
As if a parson already he were."

Yes, many a jest against me they devise,
But all their attacks I completely despise,
And the way that they all at my virtue rail —
But send me the ducats, do, without fail.
Every day ten hours I pass,
At the very least, in college and class;
And when from the college at length I come
I study the rest of the day at home."

He then goes on to describe the other occasions he has for additional supplies, such as that he has unfortunately torn his coat, and has been obliged to get a new one; he has also fallen dreadfully ill, and has been presented with unconscionable bills by his physician his apothecary, his nurse, and his confectioner; moreover, his medical adviser has insisted on his drinking wine every day, to correct the weakness of his stomach; and, to crown all, in his haste in ascending the college steps, he has tumbled down and broken his arm; the burden of the whole letter being the same, "Send me some more cash;" and he concludes —

"If you are well, and have leisure to write,
In hearing from you I shall greatly delight,
For with very great pleasure your letters I see
When they contain a remittance for me.
So, then, I think I may finish this letter.
My sister, by this time, I hope is much better.
To my mother and her I send both a buss,
And remain, your affectionate

Hieronimus.

In haste, I just add you a postscript here,
My truly honoured and very dear
Parents, I beg you truly
To send me the cash I have asked of you duly."

Then comes the paternal reply:—

"His father answered, 'My dearest boy,
I have received your epistle with joy;
And with very great pleasure indeed I've read
What of your health and behaviour you said.
But it gives me, my dearest, quite as much pain,
That your letter should ask me for money again.
With delight I hear what so clearly you tell,
That you study, and always behave so well.
But with all but delight it is I see
That you're asking for so much money from me.
Steady, my boy, you'll allow me to say,
(Permit me this observation, pray.)
That so much money cannot be needful
To one of expense that at all is heedful.
It is very true, as every one sees,
You must pay for books and college fees;
But with such a sum you could pay, adzooks!
For no end of classes and college books.
Board and lodging, I'm sure, cannot come,
With fire and washing, to any such sum;
And paper and pens, and pencils and ink,
May be bought for a very few groschen, I think.
I am also extremely delighted to hear,
That from wicked companions you keep yourself clear,
And sit in your chambers and study all day,
And love your books as much as you say.
Also, that tea is your only drink;
Still, however, I cannot but think,
That if, indeed, you drink nothing but tea,
You wouldn't require so much money from me.
If the rest, as you say, point at you as a miser,
I am glad to hear you are always the wiser;
Though the title of miser, methinks, is scarce due
To one who can spend so much money as you."

And so the unfortunate father goes on, commenting in turn on each of the extraordinary items of expense contained in his son's letter, the answering burden of the paternal epistle being, that no more money is to be asked for. The various sums now demanded, are, however, dispatched to him, and the letter concludes with the significant P.S. :—

"From you I am always delighted to hear,
But ask me for no more money, my dear."

(1) All who are not students.

(2) In plain English, "kicking up a row."

(3) Freshmen.

The period at length arrives when, his college studies being finished, our hero is to return home.

"For luggage, he hadn't a very large packet;
For, except a dagger, a sword, vest and jacket,
With the suit of clothes he bore on his back,
The never a thing he had to pack."

His books, and the rest of his property, have long since disappeared, to furnish out the necessary expenses of a real German student; and, in order to account for their absence, he determines to inform his parents that his trunks have been stolen on the road.

Thus fortified, he arrives at home, and presents himself, in true Burschen style, to his astonished parents, who do not recognise him.

"The rather, that no one could guess
Who he was in his student's dress.
An enormous hat, with a swinging feather,
Trowsers and waistcoat of yellow buck's leather,
A scanty doublet of greyish stuff,
Disguised our hero, the parson, enough.
His hair hung in rat's-tails about his throat;
He'd a beard in colour and length like a goat;
And around his waist, in a baldric slung,
A most enormous broadsword hung;
Whilst, besides his extremely martial bearing,
Breathling of slaughter and deadly daring,
At every sentence, more and more
The pious young clergyman cursed and swore."

His father, as may be supposed, is not a little scandalized at the appearance and conduct of the hopeful young candidate for holy orders; and not the less so, when he drinks up all the beer in the house, and empties the contents of the governor's tobacco-box in the course of the first evening. However, Hieronimus is at length led to see the folly of his ways,—he exchanges his merry-andrew accoutrements for a suit of decent clerical black, gives up swearing, and determines to "leave off sack, and live cleanly." All these changes improve him so much, that his father begins to re-entertain those hopes which his first appearance had so completely destroyed. These bright anticipations, too, are rendered yet brighter, by the excellence of a sermon which Hieronimus preaches as probationer; being one which he had stolen from a fellow-student before leaving college.

The fatal day, however, at length approaches, when our hero's final examination for holy orders is to take place, and he appears before a committee of clergymen, appointed to inquire into his fitness. The names and qualifications of the examiners are given at considerable length, quite in the style of Homer's list of the ships; and then they proceed to open the University certificate, which runs something as follows:—

"It is now, I think, three years or better,
Since the bearer of this my letter,
Mr. Hieronimus Jobsius,
Was here Theologus Studiosus.
Wishing now to depart from our care,
He has asked for this writing from me; and therefore
In virtue of my said station,
I give the aforesaid my signed attestation.
He has, I think, to the best of my knowledge,
Attended at least once a quarter in college.
Whether he studied in private or no,
His examination perhaps will show;
For upon this matter I can't, I protest,
In the slightest degree in this writing attest.
As to how he behaved him, if ill or well,
I'm sorry I haven't much good to tell;
But Christian charity bids me be still,
For fear I should speak of him undeserved ill.
For the rest, I am sure, I may truly say,
That I heartily wish him safely away;
And pray that Heaven may always preserve,
And grant him all happiness he may deserve."

The reading of this certificate of diligence at college,

of course does not produce a very favourable impression towards the young candidate; but the examination proceeds:—

"The learned Inspector began the first,
Hawked four times, as if like to burst,
Stroked down his paunch, and hawked again,
Coughed four times also, and asked him then—
'I, as, at present, pro tempore Inspector,
And of the present committee Director,
Ask of you—Quid sit Episcopus?'
To whom at once Hieronimus:—
'A Bishop is, I rather think,
An extremely pleasant species of drink,
Made of wine and of lemons and sugar well plied,
And an excellent tipple to warm one's inside.'
At this reply of the candidate Jobs,
All the Examiners shook their nobles.
First the Inspector said—'Hem! hem!'
And then the rest, secundum ordinem.
Then the Assessor commenced in his turn:—
'Mr. Candidate Jobs, I should like to learn
Who the holy Apostles were?'
Hieronimus boldly answered there:—
'They call by this name the glasses so clear,
From which the students drink wine and beer;
And many a jolly good Bursch that I know,
Will finish a dozen Apostles or so.'
At this reply of the Candidate, &c.
The good Mr. Kruger then took up the text,
And said, 'Mr. Candidate, tell me next
Who was the sainted Augustin?'
At once Hieronimus answered him:—
'I have never read nor heard
Of any Augustine, upon my word,
But the college bawle, who got me a lecture
Many a time from the learned Pro-rector.'
At this reply, &c.
Mr. Plotz was the next one there;
He asked, 'Mr. Candidate, how many were
Concilia œcumenica?'
Hieronimus answered him—'Ah, ha!
I was often cited, when I was at college,
Before the Council; but, in all my knowledge,
No Council ever addressed to me
A single word on economy.'
At this reply, &c."

And so they go on asking various questions, all of which Hieronimus answers in the same way, with romances of his college life and college slang; and all of them, of course, with about the same amount of success. But—

"For brevity's sake, my reader I'll spare
The rest of the questions they put to him there;
But, at every reply of the Candidate Jobs,
All the Examiners shook their nobles.
First the Inspector said, 'Hem-hem!'
And then the rest, secundum ordinem."

Hieronimus is, of course, thoroughly plucked, and his prospects in life ruined. His father dies of vexation, after having delivered to him a long discourse on the folly of his conduct; and the hero of the epic, passing from one situation to another, finally ends his days as night-watchman in his native town. Such is a sketch of that grand comico-heroic poem, the *Jobiad*. Its excellence, in our eyes, is not very great; but it is curious, as a specimen of the comic writings of the Germans; a portion of their literature with which we are not much acquainted, and which, indeed, we could not at all enter into. Moreover, the object of the poem is good; and, as it appears to be admired in its own country, it is not impossible that it may be productive of benefit,—showing up, as it does, the absurdities of the Burschen system.

BLACK FRITZ.

CHAP. IV.

THE eight days were passed, and Luitgarde appeared again before Father Augustin. Through the visible surprise with which he received her there shone a mark of tranquil satisfaction, and he replied to her questions, whether he had well considered her project, and intended to aid her in its accomplishment, that something might be done—something even, perhaps, hoped for, as to the conversion of the captive, but—Luitgarde must make up her mind to go herself to him in the dungeon.

She was alarmed, but replied—"If there be no other way, I am even ready for that; and, as soon as you, honoured father, can assure me of discretion and silence, so that, except you and he, no one can learn anything of this hazardous step—"

"This I can do," replied the father.

"Name, then, the day and hour."

"But, you are really in earnest?"

"It is my firm resolution; I will do what I can to save his soul. I will, for his love, which I have so badly recompensed, give this as a compensation."

The features of the father brightened up more and more as he observed Luitgarde's fixed purpose, and the visit was appointed for the next day but one.

With the necessary precaution, and fully disguised, they proceeded on their way. The nearer Luitgarde came to the miserable spot, the more her whole frame was violently agitated. Father Augustin prepared her for what she was to find; a deep, dark, subterranean dungeon,—the prisoner bound hand and foot with heavy chains, lying on his hard couch, through which the chains passed down, and were attached underneath by an enormous lock. Through long, dark passages—by close, grated apertures, out of which proceeded the clank of chains, imprecations of rage, or deep groans,—pale and tottering, she followed her leader. Now the way led down a narrow staircase; the turnkey opened, with a rustling noise, a creaking iron door,—and they were on the spot.

An ice-cold current blew from the damp and gloomy abode. The father went forward; he addressed the captive, who, lying on his face, did not even once turn his eyes towards the persons entering, and said to him in a friendly tone,—*"Fritz, thou hast longed to see the well-known person; if thou wilt be persuaded of her innocence—here she is."*—At these words, he seized the veil, which Luitgarde from anguish and sorrow had forgotten to raise up.

"Art thou she?" exclaimed the prisoner. "Thou comest into this abode of horror and wretchedness!" He gazed on her awhile, half tranquil, half irritated; gradually his features took a darker expression, and with a laugh of bitter mockery, said he,—*"Art thou meditating some new deceit? Wilt thou draw out still more from me, in order to betray me to my torturers? It is not necessary; I am ready to die, I have no wish to escape."*

"Thou art silent!" continued the captive; "thou art silent! I see how it is with thee." And now he broke out into bitter scornful reproaches against her for her falsehood, while a strange passion, partly furious and overbearing, partly tender and fervent, unveiled itself in these complaints, and allowed Luitgarde to see to the very bottom of a heart which was entirely given up to her, and which had for a long time been dear to her. She wept gently, which gradually disarmed him; and, as he became calm, she drew near to him, and said, "Victorin, I am still innocent, however appearances may be against me; listen to me!"—and she related to him now the affair of the robbers, the sensation which this story excited, and the inevitable demand of the chancellor for the ring; and while she spoke, the tears streamed from her eyes.

"Is it possible," exclaimed the captive, "that you

do not hate me? Does there still exist a voice in your heart which speaks for me?"

She raised her head, and through her tears looked at him earnestly and tenderly, while she replied, "I wish you well from my heart; it was the same from the first moment I learned to know you; and I tell you, as truly as I wish for you and for myself eternal happiness, I am innocent of your betrayal."

"Merciful God!" exclaimed he aloud—"but, alas! alas! what have I done! I have calumniated you. God cannot be merciful to me!" He fell down on his face, and his heart heaved with fearful convulsion.

Luitgarde placed her hand on his shoulder; "Victorin!" said she, with deep emotion, "believe me, God is infinitely good, and long-suffering; and if you, a weak and dying being, can forgive me by whom you believe yourself injured, shall not the all-merciful Father forgive his fallen and repentant child?"

Father Augustin now came forward; with all the force of holy truth—with all the knowledge of the human heart—and with all the persuasion of his high mission—he penetrated irresistibly into the soul of the wretched man. He struck at that heart which was still capable of many beautiful sentiments, and, at length, he succeeded in melting its hardened covering. The captive raised himself up; Luitgarde saw his face bathed in tears. "And do you believe—do you really believe, honoured father," said he, deeply affected, "that God can still pardon me—me, so corrupt and hardened a sinner?"

The worthy priest rapidly seized on these expressions; he developed the immeasurable extent of the divine mercy; he quoted all the places in holy books which promise pardon to the repentant sinner. Victorin's tears flowed more abundantly. "O God! O God!" exclaimed he at last, and flung himself on his knee, from his bed, *"canst thou forgive me?"* At this moment, the sun passed over the grating of the prison, and shot down a clear light on the kneeling captive.

"Surely, thou art heard—thou art forgiven!" exclaimed Luitgarde, in a holy inspiration.

"May God give you strength, my son!" said the priest, putting his hand on the young man's head.

Luitgarde sunk on his breast. "Ah! this angel in my arms!" said he, "do I dare presume to look at you? O God! pardon thy contrite—thy despairing child!"

A deep and holy, though humble, tranquillity lit up the countenance of a fallen sinner, on his return to his divine Redeemer. When the three persons had recovered from their emotion, Father Augustin said to Luitgarde, "Now, my young lady, I shall accompany you out of this place, for I must speak alone with him;" to which Luitgarde silently yielded.

"I dare still once more, before my death, hope to see you, noble young lady!" said the captive, respectfully, but with evident anguish.

She held out her hand to him in tears; "I shall see you again, Victorin; we are not separated." The priest led her out.

Victorin's repentance was not the passing feeling of the moment. It gradually advanced under the wise guidance of Father Augustin. His obstinate deportment towards his judge now disappeared; he acknowledged his guilt, he claimed no indulgence, he wished to die; only one goal appeared to him worth wishing for in this world,—the possession of the woman whom he loved above everything else—of her, who awoke long before in his callous heart the first movement of a nobler nature; and she was, through his guilt, for ever removed from him.

Luitgarde, like Victorin, had resigned herself to her destiny; even to her, it was clear that he must die. But, although her mind was made up for that event, yet one thing pressed anxiously upon her mind, namely, the clearing up of Victorin's birth. She admitted the priest into her secret; and, after many consultations, it

was at last decided that the latter should write to the Count von Lansky, send the ring to him, and communicate to him the recollections of the prisoner from his childhood, and other presumptions, and then await his decision. Victorin was to know nothing beforehand of this communication. The reply soon came back. Paternal anxiety and hope—paternal joy and pain, were in opposition with each other in it; still it left everything undecided, much to hope, still more to fear. But the count himself would come to Prague, and, in the mean time, Father Augustin was to examine the captive more closely, and prepare him for his arrival. He did so. All that Victorin related—all the glimmering recollections upon which he dwelt—the value the good collier's wife, his nurse, put upon the seal ring—the consideration which she secretly sought to impress him with for it, as for his most valuable possession—stray words which he heard fall from his nurse and her husband, in the Saxon mountains, all agreed completely with Luitgarde's conjectures. At length, Father Augustin ventured to disclose to him the probable secret of his birth, and of his rank.

He was beside himself at the intelligence. Pride and despair, joy and overwhelming sorrow, tore his breast; and the thought of having found, perhaps, in the last moments of a life condemned and devoted to the executioner's axe, a splendid birth, a father, and a noble lady, dear to his heart—in short, everything which can give value to existence, to lose all these blessings in a few days, was a greater burden than his mental and bodily strength could endure. He fell under it; a wasting fever seized him, and the worthy father saw, not without a mixture of satisfaction, the approach of a welcome death, which should spare the captive the last soul-harrowing steps, and the open disgrace.

At the priest's earnest solicitations, the patient was brought into a healthier room, the heavy bonds were changed for lighter, and he was attended to with greater care; his well-preserved youth withstood the violence of disease, and, as his strength returned, the impetuosity of his spirit was subdued. As soon as he came to himself, capable of some recollection, and saw the priest enter, he held out to him his hand, with a quiet and gentle mien, and spoke; "Now, Father Augustin, I have found it; now I am at rest! O, pardon the pain, the sorrow I have caused you!"

"And, my child, what have you found?" asked the holy man.

"Ah! a thread which shall lead me, honoured father, from the labyrinth of my despair, and of my corruption!" And he went on to develop, with a kind of noble elevation, the thought that God had so wonderfully led him, and brought him back to himself at the very end of his earthly career.

Joyous and tranquil, the good old man proceeded by his exhortations to strengthen his disciple in his pious thoughts and resolutions, and presently repaired to Luitgarde, in order to make her a report of all. Scarcely had he arrived, when the door opened, and a man of middle age, of tall and noble presence, entered the room.

"Gracious heavens! Count Lansky!" exclaimed Luitgarde.

The count stood still with amazement! "You know me, noble lady? I do not know that I ever—"

Luitgarde blushed deeply. "Pardon, count, we presumed—we knew—"

"Is my friend Martinitz at home?"

"He has gone to meet his son, who is expected in a few days; I am his niece, and this clergyman is Father Augustin."

The count went up to the father, and silently, but with great emotion, shook him by the hand. He then looked fully at Luitgarde—"Tell me candidly, how you recognised me at the first glance."

"If I am to tell the truth, an evident unerring resemblance—"

"With the robber chief?" said the count, warmly. "Oh so then, it must indeed be true! Am I then to have found a long-bewailed and only son for no other purpose than to see the disgrace of my family in him."

The priest came forward, and sought to alleviate that painful sentiment, whilst he represented to the count the admirable deportment, the pious devotion, of the unhappy man. He listened, absorbed in deep reflection; then he turned towards Luitgarde, and said, "And you, young lady, what may be your name?"

"Luitgarde Branow—"

"This cannot be! Surely everything unites to drive me to despair! You are Miss Branow, the daughter of the sister of Count Martinitz?"

Luitgarde bowed affirmatively.

"Yes, these are her eyes! so looked Adelheid, such was her stature. O, heavens! and do you know what fate was intended for you?"

She replied with a heavy sigh, and said, "I know, count; I have long had some knowledge of it."

"And do you abhor him whom the wretched parents had destined for you?"

Luitgarde's tears burst out, but, presently composing herself, she related to the count everything, from the first occurrence on the banks of the Moldaw, up to her last visit to him in the dungeon. Count Lansky listened to her with nervous agitation; by degrees, his indignant spirit melted into tenderer sentiments; paternal sympathy, and a deep sorrow at the noble qualities which a hostile fate had destroyed, took their place in his heart. At last he rose up with tears in his eyes, and said, "Now, if it then be true, and I am to find again in the prisoner my lost child, let us go to him. Of all things, a torturing uncertainty is borne with the greatest difficulty; and I do not know whether I should fear most at having no son, or at seeing him again such as he is. Conduct me to him, Father Augustin; and you, noble lady, daughter of the unforgotten friend of my youth, are you still so kind as to accompany us?"

They went; Father Augustin opened the door of the high-vaulted, fast-grated apartment, in which, however, cleanliness and friendly daylight agreeably greeted them as they entered. Luitgarde, with a high-beating heart, remained outside the half-opened door, in order not to interrupt the affecting scene. The captive stood up from the table, at which he was reading a pious book. He went to meet the priest, as far as his chains permitted, and kissed him with respectful joy. The paleness of his features, the slowness of his movements, bore testimony to what he had suffered, and drew towards him the sympathies of the beholders.

"This is an envoy from the Count von Lansky," said the priest, "who is come to ask you for the circumstances of your early history, and your recollections; you know of what importance the truth of your declaration is in this matter."

Victorin bowed in silence, whilst he placed his hand on his breast; and a sudden emotion appeared to seize him, at the look of the stranger, and at the name of his supposed father.

Even the old count regarded him with evident embarrassment. When he began to speak, he scrutinised him severely, and even with some hardness in his tone and look. The captive replied respectfully and gently. The harshness in the count's manner diminished gradually, as his attention became fixed on the wretched man, in whose form and deportment no common mind, nothing ignoble was expressed; but his embarrassment augmented with every proof which the prisoner exhibited, and at last he gave way to a deep internal struggle.

"All, all is accurate," he exclaimed, sorrowfully; "still one only mark remains to decide on the misery and shame of an aged nobleman."

Victorin became pale, and retreated.

"The lost son of the Count Lansky must have a scar

on his forehead, from a heavy fall he had in the fourth year of his age. Have you that?"

A rapid glow passed over the countenance of the victim; he drew, with trembling hand, the dark lock of hair from the upper part of his forehead, and the scar appeared.

"Just heaven, it is he! he is my son!" exclaimed the count, with heart-piercing accents; raised both his hands before his face, and, with violent emotion, turned away from his now discovered son.

"My father! oh, my father!" exclaimed Victorin; he stretched out his arms, and pale, with faltering steps, retired, as he saw his repugnant gesture. Father Augustin went up to him to support him; but, at that moment, Luitgarde, who, at the last words, unobserved, had approached nearer, sprang forwards. She embraced him with both her arms, and exclaimed, "And if your father rejects you, if all the world abandons you, I do not abandon you! I am yours—unalterably yours!"

The unhappy man gazed at her with looks of deepest tenderness, and sunk powerless in her and Father Augustin's arms; they placed him on his bed of straw, they exerted themselves to arouse his still living spirit. The old count sternly turned towards the group; he saw the death-pale youth who bore his features, who was his only son, as one dying in strangers' arms. The father's heart was deeply affected; he ran towards him, embraced him in tears, and exclaimed, "He is still my son! my only, my beloved child! Awake, awake, my Victorin, my son!"

The count leant forward to raise him up, and pressed him in his arms, to his paternal heart. Luitgarde and Father Augustin remained stationary, weeping and praying in silence; but after some time the storm of excited feelings was allayed, and they were able to converse together upon their position. Victorin related calmly and frankly his history. When he came to the period of his robber life, he implored his father to permit him to pass it over; and he ardently protested that, since he saw Luitgarde the first time, his hand had shed no blood, and a resolution to separate himself from his associates, to renounce the life of a bandit, and to render himself worthy of the object of his affections, had grown up powerfully in his breast.

His father, deeply moved, listened attentively to the recital; the thought, whether it might not be possible to save the only child, in whom a noble and now repentant heart was mirrored, awoke in him with greater force, and increased with every evidence of the altered mind of the prisoner. He would go to Vienna, throw himself at the feet of Ferdinand, and implore from him the pardon of the victim. Victorin, however, rejected this proposal—he had no wish, he said, to live; the recollections of his breast were too painful; he looked on death as but the just award of God's offended justice, and of outraged social duties. But he implored his father to avail himself of his rank and connexions to procure for him a more speedy and less opprobrious death, without torture, and by the sword of the executioner of justice.

When Count Lansky and Luitgarde came to the house, the uncle and his son had also arrived. Martinitz met the early friend of his youth with joy and surprise. Explanations took place. The unhappy circumstance of Luitgarde's position between Frederick and Victorin—the destruction of hopes, which were long and ardently nourished—sympathy with his son's unfortunate position, at first produced discontent in the heart of Martinitz. But his better judgment gradually gained the ascendancy. He recognised the influence of a higher destiny, which mocks at the plans and hopes of men; he had nothing to object to the validity of Luitgarde's first engagement, which was the ardent desire of his dying sister; he could not condemn the force of a passion which showed itself true and steady from the first moment of recognition, amidst dangers, suspicion,

and separation, and as one which had been preserved in the hearts like a pre-ordained union.

Thus did he yield to Count Lansky's representations; he himself spoke to Frederick, and represented to him as decided what he had already on his journey here thought it right to prepare him for.

Meanwhile, Victorin's sentence was passed; and it was announced to him that he was to die on the third morning. Luitgarde was informed of it with discretion. At this moment her long-supported strength gave way; she recovered late from a deep swoon, but she became acquainted with the short time she had to enjoy with her friend on earth: she exerted all her strength, and implored from her uncle only the permission to pass the last days with the beloved of her infancy, with the man to whom her blessed mother destined her, in the society of Father Augustin.

Count Martinitz shook his head. Victorin heard of this project with ecstatic gratitude. His father, in tears, embraced Luitgarde, and Count Martinitz allowed himself to be persuaded to accompany his niece, and at the same time make the acquaintance of the unhappy son of his friend, who had caused in the world, and in his house, so much disturbance.

He entered the chamber of the prisoner with a pre-determined constraint. Victorin was now, since his condemnation, better and more kindly treated, according to his usual habits, and dressed, according to his wish, simply but suitably to his birth and station, in which the humility of the repentant sinner was mixed with the sense of noble rank. The quiet deportment, the bearing of the contrite and unhappy man, touched even him; he embraced the once-hated person with a hearty warmth, and assured him of his full pardon. Luitgarde, Count Lansky, and Father Augustin passed this and the following day entirely with Victorin.

Luitgarde held up with all her strength, although internally she felt too well the influence of the long and harassing excitement, and foresaw what would happen when the decisive moment should arrive. On the second evening—it was that before the day of execution—after she and Count Lansky had taken the last farewell, and Victorin, like a dying man, dismissed her, calm, pious, and resigned, she sank down in the passage, before his door. She was carried, without consciousness, to her home, to her bed, and did not recover during the whole frightful night from her swoon.

Next morning Father Augustin, with deep sorrow and holy tenderness, accompanied his converted son upon the last sad journey. Victorin was prepared—occupied with God and the momentous event now near at hand, he advanced tranquilly and steadily through the staring multitude, who, by words and tears, showed their sympathy for him, on account of his beauty, his youth, and his evident repentance. At the place of execution he gave to his spiritual father the last holy kiss for his father and for his beloved, his eyes were bound, and in a few minutes his soul stood before God, who penetrates the acts and intentions, circumstances and relations of mortal man, more clearly than weak human beings can, and for His Son's sake judges them in mercy.

At the same moment Luitgarde recovered from her swoon. "It is passed!" she exclaimed: "O, Victorin, let me come to thee!"

Her heart was broken; she lingered some time longer—but, in a few weeks, sorrow had slowly snapped all the threads of a blooming, youthful life. About two months after Victorin's death, and about the same hour of the morning in which he died, she gently and serenely expired, the pious father having administered to her the last consolations of the Church, and having strengthened and supported her to the last with his holy counsels.

THE ASCENT OF THE JUNGFRAU,

ONE OF THE BERNESE ALPS.

PART II.¹

THE party left at The Repose the greater part of their provisions, and carried with them only a little bread and wine, some meteorological instruments, and articles of different kinds; amongst others, a ladder, a hatchet and a cord. At 10 o'clock they set foot on the first plateau of snow, and were disappointed to find that it was neither sufficiently compact, nor covered with a crust thick enough, to bear walking on, so that they sunk very deep, in some places up to the knee. The fissures were frequent where the declivities were steep. Some of them were nearly a hundred feet wide, but not very continuous, so that our travellers were able to go round them; or they were concealed beneath the snow, in which case the greatest caution was required to avoid danger. On this account they advanced slowly, and, in spite of all precautions, some of the party sank down, but without sustaining any injury. In this way they scaled many terraces, and always directing their course westward, arrived at a vast expanse, commanded on all sides by mighty peaks, the highest of which was the Jungfrau. "Here," M. Desor remarks, "we saw nothing but insurmountable difficulties on all sides; on the right, vertical precipices; on the left, masses of ice which threatened to crush us by their fall; and in front the great fissure, to all appearance impassable, so widely did it yawn. I could not avoid asking Jacob in what direction we were to ascend; but he refused to answer my question, contenting himself with saying, that we had only to follow him with all confidence, and that, for himself, he already saw the road we should take."

It was nearly mid-day when the route was resumed. The heat was excessive, and the guides, in order to refresh themselves, placed handfuls of snow on the napes of their necks. Many of the party did the same, and found benefit from it, notwithstanding the apparent danger; but in these elevated regions the body is much more independent of hurtful influences than in the plain. The reflection of the light from the snow was so intense as to be almost insupportable without wearing a veil; but this renders the footsteps less secure, and increases the heat of the face. The party reached the great fissure above referred to, after surmounting a fourth terrace. It is a gulf of unknown depth, opening upon the declivity of the last terrace but one, and penetrating somewhat obliquely into the snow; its breadth is nowhere less than ten feet, so that a ladder is required for crossing it. Immediately above the great fissure the terrace was fearfully steep for a space of about thirty feet; and the snow which had hitherto been very loose, now became so hard that the guides were obliged to cut steps. Jacob and Jann ascended first, and then let down a rope to the rest of the party to assist them in mounting this perilous path. In this way they all arrived safely at the upper terrace, where they were able to walk with comparative ease.

They had not advanced far before another fissure opposed their progress. It penetrated like the

former obliquely into the mass of snow, so that one of its walls was thinner than the other, and ran beneath it, a circumstance which rendered the passage more difficult. A new danger here met them, which is thus described. "As Agassiz, Jacob, Jann, and I, had gone a little in advance, while our companions were still engaged in climbing the first ascent, I proposed that we should wait for them, that we might at least get the rope. Jacob thought we could pass it well enough without this precaution. In fact, he found a place where the fissure was sufficiently narrow to allow him to stride over it; after having done so, he stretched out his hand, and assisted us to do the same. While three of us were standing on the edge of the northern lip of the fissure, we suddenly heard a dull crackling noise beneath us; at the same time the mass of snow on which we stood sunk about a foot. The guide Jann was at this moment on the other side, and upon seeing what had happened, he was so alarmed that he cried out to us—'For heaven's sake, return quickly!' Jacob, on the contrary, far from allowing himself to be disconcerted, told him instantly to hold his tongue, and making a sign to us to follow him, he continued the ascent at a quickened pace, repeating in his Haslian dialect—'It's nothing at all; always go forward!'

"Although we had great experience in glaciers, and were familiarized with the dangers they present, I must, however, confess that at this moment I felt my heart beat quicker than usual; but such was our confidence in our guide, that we hesitated not an instant in following him." Jacob afterwards explained the cause of their alarm to be nothing more than a layer of fresh snow sinking down upon an older layer, and mentioned more than one example of his having found the surface sink many feet under him.

At two o'clock the party arrived at the Col de Rott-thal, a wild, disrupted valley, covered with mists, which prevented them from noticing its features, celebrated as it is over the country as the abode of turbulent spirits, known under the name of *Seigneurs du Rott-thal*. The party rested for awhile before they encountered the last peak, which seemed likely to be the most difficult of ascent. From the Col where they stood, its height was estimated at from 800 to 1,000 feet. The ground was covered with compact ice, in which the guides were obliged to cut very deep steps, so that the progress was slow, sometimes not amounting to more than fifteen steps in a quarter of an hour. The cold was here very severely felt, and in the most difficult part of the ascent they were suddenly enveloped in a thick mist. The precipices were frightful, and the path was well calculated to alarm every one who had not full confidence in his head and legs; for the uppermost ridge is nearly in the form of the section of a cone, with vertical sides. They ascended in a straight line without any zig-zag, so that if by mischance one of them fell down, it would not have been impossible for the others to draw him up. They walked on the edge of the ridge, because the ice in that place was less hard; but by this arrangement they had the precipice constantly under their eyes, being separated from it only by a slanting roof of snow, the breadth of which varied from one to three feet. The poles of the travellers often penetrated through this snow roof, and they were thus enabled, every

¹ (1) Concluded from page 36.

time the fog dispersed for a moment, to look down through the hole made by the pole into the bottom of the great circus at their feet. Far from dissuading them from this, the guides encouraged all to do it who were free from giddiness, as an excellent means of giving them confidence. All at once the veil of clouds which concealed the mountain rose, as if touched by the perseverance of the party, and the Jungfrau displayed itself to their admiring eyes in all the beauty of its wild and majestic forms.

After ascending for some time in the same direction, the party suddenly turned to the left, traversing the inclined surface of a semi-cone until they arrived at a place where the naked rock was exposed, and where they saw, as if by enchantment, at the distance of a few paces, the summit of the mountain, which hitherto seemed to recede in proportion as it was approached. Of the thirteen who formed the party on leaving the cottages of Mæril, eight reached the top of the mountain. These were Messrs. Agassiz, Forbes, Du Châtelier, and Desor, accompanied by four of the guides. About ten feet below the highest peak is a small elbow, and on reaching this they saw, with some alarm, that the space which separated them from the real summit was a sharp ridge, in some places ten, in others eight, or six, inches broad, by a length of about twenty feet, while the declivities on the right and left had an inclination of from sixty to seventy degrees. Nearly all the party except Jacob were of opinion that the actual summit could not be reached, but, laying aside the articles he was carrying, Jacob began to advance, passing the pole over the ridge, so as to have the latter under his right arm, and walked along the west side, where he endeavoured to make solid steps by treading down the snow as much as possible with his feet. A few minutes were sufficient to enable him to gain the summit.

So much assurance and coolness gave courage to the party, and, when the guide returned, no one any longer thought of staying behind. Jacob took M. Agassiz by the hand, and conducted him without difficulty to the summit. It is a kind of triangle, about two feet long by a foot-and-a-half broad, which has its base turned towards the Swiss plain. M. Desor thus describes the feelings of the party on actually attaining the summit:—

"As there was room for only one person at a time, we went by turns. Agassiz remained upon it for nearly five minutes, and when he rejoined us, I saw that he was greatly agitated; in fact, he confessed to me that he had never experienced so much emotion. It was now my turn: I found no difficulty in the transit; but when I was on the summit I could not prevent myself, any more than Agassiz, from giving way to great emotion at a spectacle of such overpowering grandeur. I remained only a few minutes; long enough, however, to remove any fear that the panorama of the Jungfrau will ever be effaced from my memory. After examining attentively the most prominent points of this unique picture, I hastened to rejoin Agassiz, for I feared lest an impression so powerful should deprive me of my usual confidence. I had need of grasping the hand of a friend, and I venture to say that I never felt so happy in my life as when I had seated myself by his side on the snow. I believe that both of us would have wept had we dared; but a man's tears ought to be modest, and we were not alone; and such is the strength of the

habits which society makes us contract, that, at twelve thousand feet, there was still a regard to etiquette. Messrs. Forbes and du Châtelier visited the summit in their turn, and I have reason to know that they were not less touched than we. Indeed, he who could remain indifferent at such a spectacle would be unworthy of contemplating it."

"Amid yon mountains far descried,

With ice eternal crown'd,

'Mid glaciers spreading far and wide

A frozen ocean round;

'Mid floods that from unfathom'd caves

Sent up the voice of viewless waves,

Where at the thunder's awful peal

Th' o'erheating avalanche bursts, and rocks beneath it reel.

"Mid these, that spake Jehovah's might,

Where nature felt her God,

My spirit wing'd a loftier flight,

My foot devoutlier trod,

Than where ambitious art display'd

Her pomp, her pillar'd colonnade,

And genius, 'mid adoring Rome,

Earth's stateliest temple crown'd, and pois'd in air the dome."

From the summit of the Jungfrau the outlines of the distant mountains were by no means accurately defined; but, had they been so, they would probably not long have engaged the attention of our travellers, so fascinated were they by the spectacle presented in the immediate neighbourhood. Before them lay extended the Swiss plain, and at their feet the anterior chains were piled up in stages, and seemed, by their apparent uniformity, still further to increase the size of the mighty peaks which rose almost to the level on which the observers now stood. At the same time the valleys of the Oberland, which shortly before were shrouded in thin mists, could be descried in many places, and thus, to a certain extent, the lower world could be contemplated through the openings. On the right the valley of Grindenwald, with its glaciers, could be distinguished; on the left, in the depth, an immense crevice, and at the bottom of the latter, a shining thread which followed its windings; this was the valley of Lauterbrunnen, with the Lutschinnen. But, above all, the Eiger and Mönch attracted attention. It was difficult to form an idea as to what these summits were, which seemed nearer heaven than earth, when seen from the plain. Here the observers looked down upon them from above, and from no very considerable distance. Opposite, on the western side, rose another peak, less colossal but more beautiful; its sides, entirely covered with snow, obtained for it the name of Silberhorn, or Silverpeak. In the same direction were observed many other peaks, alike crowned with snow. These summits, many of which have as yet obtained no name, form, as it were, the immediate attendants upon the Jungfrau, which rises like a queen in the midst of them.

In an eastern direction were mountain-masses of great extent, and more savage character, one of which, the Finsteraarhorn, (13,428 feet,) is the highest mountain in Switzerland, and the only one which rose above the level of the Jungfrau (12,870 feet).

On the southern side the view was intercepted by the clouds, which had been collected for some hours on the chain of Mount Rosa. But this disappointment was more than compensated by a very extraordinary phenomenon, thus described:—

"We were beginning to fear that the mists would

envelope us a second time, when they suddenly stopped at some feet from us, no doubt from the effect of a current of air from the plain, which prevented them from extending further in this direction. Thanks to this circumstance, we found ourselves suddenly in the presence of a vertical wall of mist, the height of which was estimated at 12,000 feet at least, for it penetrated to the bottom of the valley of Lauterbrunnen, and rose many thousand feet above our heads. As the temperature was below the freezing point, the minute drops of mist were transformed into crystals of ice, which reflected in the sun all the colours of the rainbow; one would have said that it was a mist of gold sparkling around us. It was a spectacle at once terrible and attractive."

On returning to the elbow or projecting angle already noticed, Jacob poured out a glass of wine for each one of the party, and they drank with great feeling "to the welfare of Switzerland." The party then reposed for a short time on the snow in order to contemplate, as naturalists, the surrounding spectacle. The Jungfrau, apparently so compact when viewed from Berne and Interlaken, does not form a continuous mass, but is composed of a series of ridges drawn up one behind another, and separated by deep cuts or valleys. These ridges are arranged according to their height, so that the first, or that nearest the plain, is the least elevated, and the last the highest.

A number of observations were made respecting the forms and other characters of the neighbouring mountains. The thermometer indicated 26° Fahr. in the shade, but so engrossed were the observers with their subject, that they did not feel the cold.¹ The sky above was perfectly clear, and of so deep a blue that it approached to black; they endeavoured to discover the stars which at great heights are said to be visible during the day, but they did not succeed. They were much surprised to discover on the surface of the exposed rock, as well as on the fragments detached from it, many lichens in a very fresh state, some of which occupied a surface of many inches in diameter. A hawk was seen hovering in the air above the heads of the party, whose presence apparently excited its curiosity, for it described many circles around them.

Many discordant accounts have been given respecting the influence of the air, in elevated situations, on the human frame. M. Desor says:—"During the whole time we were on the summit, and also during the ascent, we experienced none of those occurrences, such as nausea, bleeding at the nose, ringing of the ears, acceleration of the pulse, and so many inconveniences which those who have ascended Mont Blanc tell us they were subject to. Must we ascribe this to the difference of 1,500 feet which there is between the height of Mont Blanc and that of the Jungfrau? Or, rather, should we not seek the cause in the habit we had contracted while living for many weeks at the height of nearly 8,000 feet? But it ought to be remarked, that M. du Châtelier, who had been among the mountains for only a few days, was not more affected than we." M. Desor is inclined to believe that there is some degree of exaggeration in all that has been said on the subject; and that some travellers

have, perhaps, allowed their imagination to deceive them, like those medical students who fancy themselves every day to be affected with the malady their professor has been describing.

"We could not quit the summit of the Jungfrau without leaving some traces of our visit; and, as we had not brought a flag with us, it was determined that we should employ M. Agassiz's pole for this purpose, as it happened to be the longest. For my part, I was willing to sacrifice my cravat, and was about to attach it to the end of the pole; but one of the guides, lamenting the fate of the cravat, which he doubtless thought too pretty to be delivered up to the fury of the tempests, asked leave to substitute his pocket-handkerchief for it. We thus managed, by means of a travelling-pole of fir and a purple-coloured rag, to manufacture a flag, which Jacob fixed on the summit we had just left. He drove the pole nearly two feet into the hard snow, so that it rose only two feet and a half above the surface."

At four o'clock the party were ready to descend. The ascent had been sufficiently painful, and it was feared the descent would be still more so. The slope was too great to admit of walking in the usual manner, and the party were forced to descend backwards. "I confess," says M. Desor, "that the first few steps gave me some uneasiness; for, as Agassiz and I had no guides before us to direct our feet, we were obliged to look constantly between our legs to find the steps, which made the steepness appear much more giddy. But in a few moments we recovered ourselves: and such was the regularity of the steps, that, after a few hundred paces, we knew them by the touch of our legs, and had no need of looking at the place where we set our feet. The slope, however, was always nearly the same, varying between 40° and 45°, according to Mr. Forbes's repeated measurements; that is to say, nearly equal to that of the roofs of our Gothic cathedrals." In spite of this excessive steepness, the party reached the Col de Rott-thal in about an hour. They crossed in safety the crevice near which the sinking of the surface took place during the ascent, and also the great fissure. They had only some platforms of snow to descend in order to rejoin the rest of the party at The Repose. They had now gained so much assurance in the descent that they ran rather than walked; no longer paying any regard to fissures, although they were perhaps more treacherous than in the morning, for the sun had softened the snow during the day. Jacob did not cease to recommend caution, repeating, "Gently, gently," with the same calmness as when he ascended.

They reached The Repose at six o'clock, having accomplished in two hours a distance which it had occupied six to ascend. They all sat down on the snow with a vigorous appetite, to refresh themselves with some meat and wine. The first glass was offered by Agassiz to Jacob, the captain of the party; his health was drunk by every one in turn with much heartiness, for it was obvious to all that without him they would never have reached the summit.

Six leagues were still between them and the cottages, and that part of the glacier most abounding in fissures had to be crossed after nightfall; but no one seemed to be annoyed at this; and besides, the moon was about to rise, and the clouds had almost entirely disappeared from the horizon.

(1) The party were forced to set out without taking that most essential instrument, the barometer. During their abode on the glacier of the Aar they had broken three barometers; the fourth was imperfect, and they had no means of getting them repaired.

They traversed with accelerated pace the three leagues of névé which succeed the plateaux of snow, for the surface was smooth and regular. Scarcely had night fallen when the moon rose opposite to them, directly in the axis of the glacier, so that the whole of this great river of ice was uniformly illuminated, and reflected a light so much the more pleasant after the painful light of the sun by day.

On entering the region of fissures, the party formed into a file by means of the rope, for, although the moonshine was very clear, the light was not sufficient to enable them to distinguish with certainty the old snow from that recently fallen. At each step one or other of the party was obliged to retire from a crevice, and, after a few slight accidents, they succeeded in getting over this unpleasant part of the course.

At about nine o'clock they suddenly heard the cry of a shepherd. "Bravo! it is our Valaisan!" exclaimed they. This man had been ordered, on leaving the cottages, to start at six o'clock with provisions to meet the party. After having exchanged with him some of those shrill and piercing sounds which the mountaineers can make to penetrate to the distance of leagues, the party perceived that he was on the left side, so that before they could join him they had to cross a considerable part of the glacier. The brave fellow was laden like a mule; for, in addition to the provisions which he was told to carry, he had brought a quantity of excellent new milk, still warm. "This was unquestionably the most delightful refreshment that he could have offered to us, and almost every one left the wine for the milk. We seated ourselves in a circle round our Amphitryon, taking draughts in turns from his immense vessel, till it was nearly empty. This was the most picturesque repast, and at the same time one of the most grateful, I have ever enjoyed."

Nearly three leagues remained to complete the journey; but, with the exception of some fissures, the road was easy, and the party at length arrived on the banks of Lake Mairil. Here they made their last halt, in order to admire a singular spectacle. The blocks of floating ice which swam on the surface had a most alluring effect when seen by the beautiful light of the moon. At the same time the section of the glacier in the back-ground appeared like an immense wall of crystal; and what further added to the beauty of this spectacle was, that the observers arrived just at the moment when the moon was passing behind the mountain-mass which overlooks the lake, and they saw in a quarter of an hour the most varied effects of light, and the most striking and interesting contrasts. It was a finale worthy of such a day.

At half-past eleven o'clock they re-entered the hospitable roof of the Valaisan shepherds, after a journey of upwards of eighteen hours. "As for fatigue, we did not feel it even now, so pre-occupied were our minds with all the things that had passed under our eyes and moved our hearts during the day." Next day they descended to Viesch, where the guides left them. The two days which the guides occupied in their return home were a continual triumph to them, for there was not a hut in the valley of Conches, from Viesch to Obergesalp, which they did not enter and proclaim their success.

POPULAR YEAR BOOK.

November 25.—*St. Catharine's Day.*

St. Catharine is commemorated on this day in the Calendar of the Church of England. She was born at Alexandria, and "of so wonderful a capacity," that having, soon after her conversion to Christianity in 305, disputed with fifty heathen philosophers, she not only vanquished them by the strength of her reasoning, but also persuaded them to embrace the true faith. For this offence, the Tyrant Maxentius caused her to be cast into prison, where the Empress and one of the principal generals, who visited out of curiosity, were likewise converted by her eloquence and learning. This was deemed so great an aggravation of her crime, that the Emperor not only condemned the Virgin Saint to a cruel death, but caused the fifty philosophers to be burnt alive. According to Alban Butler, St. Catharine was beheaded. He adds—"She is said first to have been put upon an engine made of four wheels joined together, and stuck with sharp-pointed spikes, that when the wheels were moved her body might be torn to pieces. The Acts add, that at the first stirring of the terrible engine, the cords with which the martyr was tied, were broke asunder by the invisible power of an angel, and the engine falling to pieces by the wheels being separated from one another, she was delivered from that death. Hence the name of St. Catharine's Wheel."

OLD AND POPULAR CUSTOMS.

The author of the "Popish Kingdom" says, "What should I tell what sophisters on Catharine's Day devise, Or else the superstitious joys that masters exercise."

Whence it would seem that there were public scholastic disputations on this day before the Reformation. A writer in 1730 observes, "St. Catharine is esteemed in the Church of Rome as the saint and patroness of the spinsters; and her holiday is observed, not in Popish countries only, but even in many places in this nation: young women meeting on the 25th of November, and making merry together, which they call *Cutharning*." Formerly women and girls in Ireland kept a fast every Wednesday and Saturday throughout the year, and some of them also on St. Catharine's Day; nor would they have omitted it though it happened on their birth-day, or they were ever so ill. The reason assigned for this custom was, that the girls might get good husbands, and the women better ones, by the death or desertion of their living spouses, or at least by an improvement in their manners. About six o'clock on the evening of this day a man, dressed in woman's clothes, to represent St. Catharine, with a large wheel by his side, and seated on a wooden chair, was, till within the last few years, brought out of the royal arsenal at Woolwich, by the workmen there, and carried round the town with attendants, &c., similar to "Old Clem's." The procession stopped at several houses, at each of which a speech was recited.

November 29.—*Advent Sunday.*—(1846.)

The term *Advent* denotes the coming of the Saviour. In ecclesiastical language it is the denomination of the four weeks preceding the Feast of the Nativity. This season is set apart by the Church to the duties of devotion and penitence: anciently it was kept as a rigorous fast. Advent-Sunday, or the first Sunday in Advent, depends upon the Festival of St. Andrew, and is always the Sunday nearest to the feast of that Saint, whether preceding it, on the day itself, or on that following it.

November 30.—*Feast of St. Andrew.*—(1846.)

St. Andrew, the patron of Scotland, is one of the twelve Apostles. He suffered martyrdom by crucifixion, in the year 69, at Patras, in Achaia. The cross upon which St. Andrew suffered was different in form to that of the Passion, having been made of two pieces of timber driven into the ground, in the shape of the

letter X, styled a *cross decussate*. Hence this Apostle is represented in all pictures and sculptures as bearing a cross of that description. His festival was instituted A.D. 859. "This saint's day," says Bishop Sparrow, "is the first [in the Christian era] that is kept solemn, because he first came to CHRIST, and followed Him before any of the other Apostles; he brought his brother Simon to CHRIST; he it was that said, 'We have found the Messiah,' and therefore his day is rightly set at the beginning of Advent for ever, to bring news of the Advent, or coming of our LORD."

OLD CUSTOMS.

Barnaby Googe remarks,—

"To Andrew all the lovers and the lusty wooers come,
Believing, through his aid and certain ceremonies done,
(While as to him they presents bring, and conjure all the night.)

To have good luck, and to obtain their chief and sweet delight."

Probably allusion is here made to some such observances as are described by Luther, who relates that, on the evening of the feast of St. Andrew, the young maidens of his country strip themselves naked, and each repeats a prayer that she may obtain a worthy helpmate, and may know that night what sort of person he will prove. In an account by Hasted of the parish of Eastling, Kent, it is stated that on this festival there is yearly a diversion called squirrel-hunting, in this and the neighbouring parishes, when the labourers and lower kind of people, assembling together, form a lawless rabble; and being accoutred with guns, poles, clubs, and other such weapons, spend the greatest part of the day in parading the woods and grounds with loud shoutings; and, under the pretence of demolishing the squirrels (some few of which they kill), they destroy numbers of hares, pheasants, partridges, and, in a word, whatever comes in their way; breaking down the hedges, and doing much other mischief.

SCENERY OF THE GREAT WESTERN RAILWAY.

No. IV.

THE Railway now passes through a rich pasture country by Cocklebury, Christian Malford, and Sutton Benger; the two latter villages having Decorated churches. Draycot, the next village, is rich in the tombs of the Cernes, and their descendants the Longs, cadets of Long of Wraxall, of whose baronial state John Aubrey gossips so pleasantly; they married the heiress of Tylney, and are now represented by the Long Welleseys. Langley Burrell church, very near the Railway, has some curious decorated work, "especially a hagioscope, or opening between the chancel and body of the church, for the convenient exhibition of the *host* to the people."

The Chippenham Station, ninety-three miles and three-quarters from London, and twenty-four and a-half from Bristol, is next reached; where the line passes from cutting into embankment, and a lofty viaduct of Bath stone, over which the Railway crosses the Malmesbury road. Chippenham was a market-town in the Saxon times: it has a cloth-manufacture, and a fine market for the rich dairy produce of Wilts. The church has a noble Norman arch, with a Decorated hagioscope.

We now arrive at the Corsham Station, ninety-eight miles from London, in cutting; and next a tunnel in the great oolite, the celebrated Bath stone. At Corsham, the cutting is crossed by a single arch of stone, ninety feet span, by twenty-one rise. The town is not seen from the Railway; it is said to have been a royal "vill" in the times of the Saxon Ethelred; and is, therefore, styled Corsham Regis. The Methuens have held the manor since the seventeenth century.

The last Railway work named, is the celebrated Box Tunnel, the longest work of its class—3195 yards, or

nearly one and three-quarter miles in length; and ventilated by six shafts, each twenty-five feet in diameter, and varying from seventy to 300 feet in depth. The quarries on the rock above are very curious: "a shaft is sunk through the forest marble and rubble beds, and the excavation is then carried in every direction; the chambers are sometimes of great extent, and from twenty to fifty feet in height. The stone is cut out with a saw, and blocks, containing 200 cubic feet, are sometimes raised to the surface; the quarrymen allow about sixteen cubic feet to the ton." It is but justice to mention that the stupendous Box Tunnel was superintended throughout its formation by Mr. W. Glennie, the assistant engineer to Mr. Brunel, upon this part of the Railway.

The Box Station, a hundred and one miles and three-quarters from London, and five from Bath, at the foot of the Box inclined plane, is reached by a short tunnel through the marle of Middle Hill. From the clay rise two mineral springs, which the colonists of Britain used many centuries since, Roman baths having been found here; and the architect to the Railway has very fitly constructed the faces of the tunnel of Roman design.

Bathford is next reached, where the Railway crosses the Avon by a beautiful stone bridge, of one elliptic arch, fifty-four feet span, and twenty-seven feet rise. Farley Down and Claverton Down, and Bathford church lying between them, are finely seen from this point. The Railway then passes close by Bath Hampton church, which has a very good Perpendicular tower; and the line then enters Bath by Sydney Gardens, the Vaux-hall of the city, which it intersects; the communication between the two parts of the Gardens being by two bridges, so that this interference improves rather than detracts from the attractions of the pleasure-place. The line then passes westward, beneath several houses and a street; and on emerging, the first view of Bath is very striking. The line crosses the Avon by an iron bridge, at the end of the North Parade. At a few yards east of the Station, the Avon is again crossed by a handsome Bath stone bridge, with a principal arch and two roadways; the arch being elliptical, eighty-eight feet span, and twenty-eight rise. At length, we reach the Station, lying obliquely to the continuation of Pierpoint-street, along which is carried its chief communication with the city.

The Bath Station is, architecturally speaking, of the age of James I., with debased Gothic windows and Romanesque ornaments. "The peculiarity of this Station," says the *Railway History*, "lies in its roof, which is sixty feet span, without buttress or tie of any description, either vertical or horizontal; the ribs or principals being, in fact, the long arms or jibs of a series of cranes, of which the side-columns represent the upright parts. These jibs meet in the middle, and are still further steadied by the cross diagonal planking of the roof." This is a very beautiful, yet simple, construction.

The Railway works between Bath and Bristol were of great difficulty and expense, and occupied four years; whereas, the whole line required but five years and four months in completion.

The Railway leaves the Bath Station by an oblique wooden two-arched bridge, of very peculiar construction; so that, although the river is but eighty feet wide, the space traversed by the railway is 161 feet. From the line there is a fine view of the crescents and the upper part of Bath, ascending to Lansdown.

The line passes through the suburb of Bath upon a viaduct; the bridges between which and Tiverton are in the Perpendicular style of Gothic architecture. The Tiverton Station and tunnel are next passed, and we reach the Newton coal-pit, yielding very fine coal for coking. A fine view of Lansdown is enjoyed here; and Kelston House and park are seen to advantage on a steep bank of the river: this property was long the inheritance of the Harringtons, and here the witty Sir John Harrington received a visit from his godmother, queen Elizabeth, in 1591.

The Saltford Station, four miles and three-quarters from Bath, is next reached; and in the centre of a cutting is the Saltford tunnel. At the Keynsham station-house, six miles and three-quarters from Bath, one of the chambers is floored with a tessellated pavement, removed from a Roman villa at Newton Saint Loe. It represents Orpheus playing upon his lyre amidst a circle of leopards, stags, bulls, &c., within a deep square border, with spandrels filled with a wreathed pattern. The white tessere are white lias, the red tessere, baked earth. Of St. Keyn, after whom Keynsham is named, some amusing legends are related. Like other holy persons, on the lias formation, he is said to have turned snakes into stone, as the ammonites in the neighbouring quarries are, by the credulous, believed to prove. This is also reputed to be the village in which the leprous Bladud met the swineherd, who hired him and whose pigs he drove to Bath by way of Swineford.

There is little noticeable further until the Railway approaches the coal-field of Bristol, and passes the seat of various manufactures, to which the presence of fuel, and the vicinity of the port of Bristol, have given rise. From this point to Bristol, much of the line lies through rocky cuttings, galleries, and tunnels, which have a wild and savage effect in comparison with the neat masonry of other portions of the works. In one instance, the course of the Avon is diverted to nearly half its breadth, and thus a shelf is gained upon the hill side of sufficient breadth to carry the Railway. Further, on the right bank of the river, are the fine sandstone cliffs and quarries of Hanham. Some of the tunnels have noble castellated fronts, embattled and corbeled, of grand dimensions, and extreme simplicity of design; and, in combination with the scenery above and around them, very picturesque. The next great work is a fine Gothic bridge, crossing the Avon, with three arches, of which the central one is 100 feet span; harmonizing with the architectural character of the Bristol terminus, which we are now fast approaching.

The engine-house is first reached, and then the coke-ovens, which supply the whole Railway consumption of about 450 tons weekly.

The Bristol Terminus comprises a passenger station, with a depot for goods; it communicates with the Bristol and Exeter Railway, and will in a short time join the Bristol and Gloucester line. The passenger station is 408 feet by 114, up the centre of which the Railway passes. The west-end, 184 feet in length, forms the principal front, and faces Temple-street. It consists of a centre, two wings, and two flanking gateways. Over an oriel in the centre are the arms of the cities of Bristol and London, being the arms used by the Company; and below is the motto of the City of Bristol, "VIRTVTE ET INDUSTRIA," the style of the Company, and the date of its incorporation. Over the archways appear the royal arms, on one side, and a turret clock on the other. The architecture of the station is Elizabethan, with some modification; the material, chiefly Bath stone. The roof has a truly noble appearance, being seventy-four feet span, without cross tie or abutment: it is composed of ribs, constructed like the jib of a crane, springing from iron columns, which divide the central space from the aisles; each jib rising to the centre and ridge of the roof, and there meeting its fellow, from the opposite side; while the short arm of the crane is carried backward to form the roof of the aisle, and is strongly tied to the outer wall. The whole is then planked diagonally.

The goods-shed is 326 feet by 138 feet; and, with its vast roof, supported on iron columns, its numerous trucks, turn-tables, and rolling platform, is a striking scene. The contrivance for raising and lowering the trucks from the level of the rails to that of the railway is ingeniously effected by a couple of alings, or scales, into which the trucks are run; and which are then alternately lowered and raised by the exertion of a water-power, obtained by the regular working of a small

hydraulic machine. In this way, loads of ten tons are raised or lowered twelve feet in about half a minute.

We find in the *Railway History* these judicious remarks on the style of architecture employed generally upon the line:—"At Hanwell, the viaduct and bridge are decidedly of an Egyptian character. As we advance further west to Chippenham, we reach the Roman style, which is seen in the viaduct there, and in the tunnel fronts and bridges towards Bath. The St. James's Bridge is Italian; and towards Bristol the buildings are wholly Gothic, one of the tunnel fronts being Norman, and the Bristol station and its approaches the later Gothic, or Perpendicular. We believe this to be the only Railway in which the advantage of using the local building material (as clay or stone found upon the line) has been combined with a considerable approach to general unity of design; and the works of which may be appealed to, to show how much real architectural beauty depends upon the proportion of the parts, and how little upon ornament, and to how great an extent a sound economy of design is compatible with the exercise of a pure taste."

The several great works on the line are illustrated in Mr. Bourne's admirable drawings on stone, which are appended to the folio *History*. Each of these views is thirteen by sixteen inches, so that there is ample space to give the massive grandeur of the works, and the picturesque beauty of the country in which they are placed; and the brilliancy and artistical spirit in which all this is done, aided by the fine "lithotint" working of Mr. Cheffins, has rarely been equalled, and never surpassed. The drawings of Church Antiquities in the Appendix are alike distinguished by their characteristic breadth and beauty.

We may briefly mention that the traffic on the Great Western Railway is altogether of a superior class to that on other lines: its principal stations are centres of districts abounding in landed gentry; and Bath and Cheltenham are supported by persons living on their own resources. The population on the line is estimated at 910,000; added to which is the population of West London, about 1,500,000. The income of the Company for six months of 1842 was 302,084*l.* 0*s.* 5*d.* This, however, is but an approximation to the probable returns of the Railway when the continuations and branch lines are completed.

The cost of the Great Western Railway (118 miles) has been five millions and a half of money; and so rapidly were the works carried on, that between 6,000 and 7,000 persons were constantly employed upon the line.

The Great Western Railway indisputably, in respect of speed, has stood first in the world, going over 118 miles twenty chains, uninterruptedly, in less than four hours and a half!

It is useless to compare this speed with the rate of the best appointed coaches that ever travelled on the Great Western road. The "long coach" system is swept away; and on September 19, 1846, the "Rival" Cheltenham coach, left the Belle Sauvage Inn, on Ludgate Hill, for the last time; this being, we believe, very nearly the last four-horse coach remaining in the metropolitan lists.

In this gossiping *iter* of the Great Western line we have attempted to present the reader with a picture of the railway system, and the mighty changes which it is fast working in the social scheme. Throughout the line there is ample field for reflection in the picturesque scenery of its course, rich in historic associations, and beautiful visions of the past, almost beyond comparison with any other district of England. How then, too, can we express our interest in the geological structure which the Railway course itself discloses, lecturing all but the least intelligent minds with the sublime lessons of change; and rebuking the folly of man in the sacred truths which are to be read, to speak familiarly, *underground!*

In parting, we should mention in the highest terms of commendation the letter-press of this *History of the Great Western Railway*, after reading which we have perused these few pages. The authors have acquitted themselves admirably, in the introductory chapter, the history of the railway, its general topography, geology, and general antiquities, as well as the description of the scenery and works on the line; to which is added an Appendix of "Church Notes," describing the most important ecclesiastical antiquities of the district. All these are detailed with an amount of industry and intelligence such as had not hitherto been displayed in any similar task.

STORIES FROM THE DRAMATISTS.

NO. I.—THE VIRGIN MARTYR. (*Massinger.*)

THE last, and most terrific, storm of persecution which swept over the early Church, broke out in the nineteenth year of the reign of Dioclesian, in the beginning of the fourth century. Every torture which the utmost refinement of cruelty, inflamed by bigotry and hatred, could invent, was inflicted upon all, without distinction of age or sex, who dared to avow themselves disciples of the Christian faith, or refused to join in the public worship of the gods. The powers of darkness seemed to have concentrated all their energies into one grand effort, more vigorous than they had ever before employed, for the destruction of the Church, but only to be still more signally defeated by that "unresistible might of weakness," with which she had risen victorious from every former conflict.

In no part of the empire did the persecution rage more furiously than in Cæsarea. The governor, Sapritius, was no whit behind the other instruments of imperial tyranny in persecuting zeal: but the chief minister of vengeance against the rising sect was an officer of high rank named Theophilus, who was expressly charged by the Emperor with the duty of enforcing the execution of the laws against them. This Theophilus was a man well advanced in years,—not naturally cruel, nor one who took pleasure in the infliction of pain or suffering for its own sake; but he hated the Christians, whom he regarded as the most impious of blasphemers, and he devoted himself to their extermination, as to a labour of love, with all the ardour of a zeal which no consideration of pity, remorse, or even natural affection, could stay in its course.

Theophilus had a secretary named Harpax, whose zeal for the destruction of Christians was even greater than his own,—who was his instigator to every extraordinary act of severity,—and by whose subtle and sarcastic reasonings the occasional relentings of his spirit were checked, and his heart closed against the persuasions of those feelings of compassion which he could not altogether subdue. There was something fearful and mysterious about this man. No one knew whence he had come, nor of what nation he was. Accident had thrown him in the way of Theophilus about the time he received his commission from the Emperor; and, in a short time, by his extraordinary activity, his sagacity, his wonderful power of diving into all men's secrets, and tracing with unerring certainty their most concealed actions,—above all, by his burning zeal for the worship of the gods, and hatred of Christianity and Christians,—he so recommended himself to the favour of Theophilus, and became so necessary to him, that he made him his secretary, kept him continually beside himself, and took no step of any importance without his advice.

Theophilus had two daughters, named Calista and Christeta. They were young and beautiful, and regarded by him with the fondest affection; for their mother was dead, and he had no other child but them. It may be judged, then, with what dismay he received the intelli-

gence, brought to him by his vigilant secretary, that these two, so dear to him, had apostatized to the Christian faith. In an agony of conflicting emotions he flew to them, hoping that for once his hitherto unerring intelligence might prove to have been misled. But there was no mistake. The two maidens had forsaken the gods whom their fathers worshipped, and they gloried in having done so. Neither prayers, nor tears, nor reproaches, nor threats, could move them to disavow the apostasy; and there seemed to remain no alternative, but that Theophilus should sacrifice his own children, as he had done so many others, with all imaginable torments, as victims to the insulted majesty of the gods. In this fearful strait, Harpax came to his aid; and, not because he was touched by the youth and beauty of the threatened victims, nor by the grief and perplexity of the father, (for, the costlier the sacrifice, the more highly did he relish it,) but because he should have in their return to idolatry, if that could be accomplished, a more signal triumph over the object of his hatred—the Church—than he could have in their death, which he well knew (for he was one of those who believed and trembled) would heap treble vengeance on his own head,—suggested to Theophilus a course by which he might show to the world that nothing would induce him to spare a Christian, and yet might stop short of the sacrifice of his children's lives. Telling him, that, were he to put them to death, the patient constancy with which they would endure martyrdom would be rather a triumph than a discouragement to the Christians, he advised him to deal with them with the utmost severity short of death, assuring him that the result would be in conformity with his warmest wishes. Theophilus followed this advice. He delivered his daughters over to the torture, which with what constancy they endured, until at length, yielding to his agony and tears, what no sufferings of their own could wring from them, they consented to renounce their Christian faith, and return to idolatry, we shall now tell in the words which the dramatist puts into Theophilus's mouth, while he recounts to the Emperor's daughter, Artemia, the success of his magisterial and paternal discipline.

On these, when they fell from their father's faith,
I used a judge's power, entreaties failing
(They being seduced) to win them to adore
The holy powers we worship; I put on
The scarlet robe of bold authority;
And, as they had been strangers to my blood,
I presented them in the most horrid form
All kind of tortures, part of which they suffer'd
With Roman constancy.

Artemia. And could you endure,
Being a father, to behold their limbs
Extended on the rack?

Theophilus. I did; but must
Confess there was a strange contention in me,
Between the impartial office of a judge,
And pity of a father. To help justice
Religion stopt in, under which odds
Compassion fell; yet, still I was a father.
For e'en then, when the flinty hangman's whips
Were worn with stripes spent on their tender limbs,
I kneel'd and wept, and begg'd them, though they would
Be cruel to themselves, they would take pity
On my gray hairs. Now, note a sudden change,
Which I with joy remember; those, whom torture
Nor fear of death could terrify, were o'ercome
By seeing of my sufferings: and so won,
Returning to the faith that they were born in,
I gave them to the gods.

In the excess of his joy and gratitude for his daughters' reconversion, Theophilus devoted them to the service of the gods, placing them in the temple of Jupiter, where they were initiated into the mysteries of pagan worship, and signalized themselves by the zeal with which, on every occasion, they argued against the Christianity they had begun to profess, in support of the idolatry to which they had returned.

There dwelt also in Cæsarea, at this time, a lady of great beauty and noble birth, named Dorothea. She was the daughter of a Roman senator, who, in dying, had left her the heiress of all his wealth. With such attractions, of course there were not wanting many suitors for her hand. Among these, the most devoted, and the most favoured by her, was Antoninus, son of the governor Sapritius, a youth of merit equal to his exalted rank, and who had greatly distinguished himself in fighting under the imperial banner. But, while he was absent at the wars, a different object had gained possession of her heart; she had been converted to the faith of Christ; and his return found her deaf to those protestations of love to which she had before listened favourably, fixed in resolve to devote her life in stainless virginity to the service of Him in whom she had learned to believe, and admitting into her breast no feeling regarding her lover, but an earnest desire that he should become a partaker of her faith and hope, even at the cost of his shiring in that martyrdom which she knew of a certainty lay before her. It was by her example and conversation that Theophilus's daughters, who were her intimate friends, were led to make their short-lived profession of Christianity.

Dorothea was daily strengthened and encouraged in her holy resolutions by the conversation of her page, Angelo, a youth of most engaging aspect, full of wisdom beyond his years, ripely instructed in all the mysteries of the faith, and in whose society she found herself, as it were, surrounded by an atmosphere of holiness, in which her love and faith, and every Christian grace, burned brighter and purer than at any other time. This page had been a beggar boy, who had some time before asked alms of her as she was coming out of the temple. Struck with something, she could not well say what, in his appearance, and in the tone of his voice, she took him home, clothed his half-naked limbs, and caused him to wait upon her as her page; while, before long, he became her spiritual counsellor and director. The following conversation will show the singular relation which subsisted between mistress and page:—

Dorothea. My book and taper.

Angelo. Here, most holy mistress.

Dor. Thy voice sends forth such music that I never was ravish'd with a more celestial sound. Were every servant in the world like thee, So full of goodness, angels would come down To dwell with us. Thy name is Angelo; And like that name thou art. Get thee to rest; Thy youth with too much watching is oppress'd.

Ang. No, my dear lady; I could weary stars, And force the wakeful moon to lose her eyes, By my late watching, but to wait on you. When at your prayers you kneel before the altar, Methinks I'm singing with some quire in heaven, So blest I hold me in your company; Therefore, my most lov'd mistress, do not bid Your boy, so serviceable, to get hence, For then you break his heart.

Dor. Be nigh me still, then. In golden letters down I'll set that day Which gave thee to me. Little did I hope To meet such worlds of comfort in thyself, This little, pretty body, when I, coming Forth of the temple, heard my beggar boy, My sweet-faced, godly beggar boy, crave an alms, Which with glad hand I gave—with lucky hand! And, when I took thee home, my most chaste bosom Methought was filled with no hot wanton fire, But with a holy flame, mounting since higher On wings of cherubims, than it did before.

Ang. Proud am I, that my lady's modest eye So likes so poor a servant.

Dor. I have offer'd Handfuls of gold but to behold thy parents. I would leave kingdoms, were I queen of some, To dwell with thy good father; for, the youth Bewitching me so deeply with his presence, Who calls him son must do it ten times more.

I pray thee, my sweet boy, show me thy parents; Be not ashamed.

Ang. I am not: I did never Know who my mother was; but, by yon palace, Fill'd with bright heavenly courtiers, I dare assure you, And pawn these eyes upon it, and this hand, My father is in heaven: and, pretty mistress, If your illustrious hour-glass spend his sand No worse than yet it does; upon my life, You and I both shall meet my father there, And he shall bid you welcome.

Dor. A blessed day! We all long to be there, but lose the way.

Dioclesian had returned in triumph from a war with the kings of Epiro, Pontus, and Macedonia, in which he had defeated their best troops, and taken themselves captive, and paid a short visit to Cæsarea, in company with his daughter Artemia. Antoninus came in his train, having gained the highest honours in the war, and having taken prisoner the king of Epiro, one of the greatest soldiers of the age, in single combat at the head of his troops. Dioclesian had no sooner arrived at Cæsarea, than he summoned the captive kings before him in the presence of all his court, and called upon them to say why they should not suffer to the utmost rigour the punishment due to rebels against the sovereign majesty of Rome. Boldly and regally they each answered him, asserting their right to freedom and independence, which they had only now lost by the fate of war, and defying the utmost extremity of his wrath. Then Dioclesian, full of admiration at their courage, took them by the hand, tendered them his friendship, and declared his intention of restoring them to their kingdoms, and conferring upon them the perpetual friendship and alliance of the Roman Empire.

Next, turning to his daughter, Artemia, (for his heart was overflowing with the sense of his good fortune, and he felt unwontedly desirous to bestow happiness upon all about him,) he invited her to look around upon the kings and nobles who were present, engaging that, if there was one among them to whom her heart inclined, and upon whom she was willing to bestow her hand, his will should ratify her choice. Many a heart fluttered high at this announcement, for the princess was young and lovely. With much dignity and modesty she thanked the emperor for a favour so seldom shown to ladies of princely rank; then, saying that, as Cæsar's daughter, she was too great in herself to be influenced in her choice by the title of queen, because whosoever she should marry, though of the highest rank, she should bring honour to him, but could receive none from him; and that, therefore, she preferred rewarding the honour and virtue of a subject, by raising him to her own rank, to sharing her dignity with a prince—she turned to Antoninus, and made him the offer of her hand. Confused and alarmed beyond expression, he stammered out a hurried declaration of his conscious unworthiness of such an honour, and urged the princess to turn her eyes more worthily upon one of the kings beside her, with so much earnestness, that her pride became alarmed; and she coldly and haughtily withdrew the offer she had made, telling him she was not so far gone in fond affection for him but that she could retire with honour; and bidding him remember, when at some future time he should feel inclined to envy the good fortune of him upon whom her hand should be bestowed, that it had been within his own reach, and that he had scorned it.

Alarmed at the tone of pique with which this was spoken, Antoninus hurriedly excused himself; attributed his hesitation to the astonishment he had felt at receiving so unexpected an honour; pled for a little delay, that his mind might become somewhat more reconciled to the idea of embracing such a dignity, and that he might be able to look upon his offered bride with more familiar eyes than his duty would yet allow. Artemia, somewhat mollified, replied that it was yet in his power

to redeem the error into which he had fallen. And Dioclesian, to afford an opportunity for their coming to an understanding, left Artemia as his substitute in Cæsarea, investing her with full imperial authority, and then departed with his train.

No sooner was Antoninus freed from the restraint of the emperor's presence, than, disregarding every consideration of interest or safety, he hastened to Dorothea, to prefer his hopeless suit to her. Harpax, ever on the watch, detected his purpose, and announced it to Theophilus, by whom it was communicated, without loss of time, to Artemia. Burning with the sense of injured affection and insulted dignity, she hastened with Sapritius and Theophilus (Harpax excused himself from accompanying them, for he had an extraordinary dread of encountering the presence of the page, Angelo) to Dorothea's house, and was privately introduced into a gallery, where, without being seen, she witnessed the interview, and heard the conversation, between Antoninus and Dorothea. In an ecstasy of passion Antoninus threw himself at Dorothea's feet, and entreated her to listen favourably to his suit: but she, with immovable constancy, avowed her determination to die as she lived, acknowledging no lord of her affections but One, to whose service she implored him also to yield himself.

Stung to madness with all she saw and heard, Artemia rushed into their presence, followed by Sapritius and Theophilus, and, upbraiding Antoninus with his dissimulation, commanded them both to be removed to immediate execution, with special orders that every means of torture should be exhausted upon Dorothea, before death should be permitted to come to her relief. Before her commands could be executed, however, moved with pity for the anguish of the old governor, Sapritius, who was inconsolable at the miserable reverse in the fortunes of his son, whom he had not an hour before imagined within reach of the highest dignity in the empire, and partly moved by her own not quite extinguished love, she recalled her sentence against Antoninus, directing him only to be kept in close confinement. For Dorothea, Theophilus, calling to mind the lesson of Harpax in the case of his own daughters, and the success which had attended it, suggested a bitterer punishment than death would be:—

Let not this Christian thing, in this her pageantry
Of proud deriding both our gods and Cæsar,
Build to herself a kingdom in her death,
Going laughing from us: no; her bitterest torment
Shall be, to feel her constancy beaten down;
The bravery of her resolution lie
Batter'd, by argument, into such pieces,
That she again in penitence shall creep
To kiss the pavements of our paynim gods.

"How is this to be done?" inquired Artemia. Theophilus answered,—

I'll send my daughters to her,
And they shall turn her rocky faith to wax;
Else spit at me, let me be made your slave,
And meet no Roman's but a villain's grave.

Artemia gave her consent, but, at the same time, issued her commands that Dorothea's estate should be confiscated.

In this hour of trial Angelo was not absent from the side of his dear mistress, but with words of encouragement and hope strove to nerve her spirits for the final conflict. "O, my dear mistress," he whispered into her ear, as she was carried away to prison, "quench not now the holy fire within thee, though temptations shower down upon thee. Clasp on thine armour, and fight courageously; and when the fight is over thou shalt see thy head clothed with sunbeams, and thy feet touching the stars."

The courage of Antoninus, which had been so often proved in battle, would have sustained him against any suffering inflicted upon himself; but the thought, that

by his mad passion he had been the cause of consigning his beloved Dorothea to torture and death, so preyed upon his mind, that his father, Sapritius, was filled with the most anxious apprehensions for his reason and for his life. Fearing that the death of Dorothea would bring his, as a necessary consequence, after it, Sapritius importuned his friend Theophilus to hasten the work of her conversion back to paganism, by the unanswerable reasonings of his daughters. Without delay she was sent for to her prison, and introduced into the presence of her two former friends, who received orders, as soon as their work was completed, to hasten with her to the presence of Artemia, who was that day sitting in council. Calista and Christeta eagerly entered upon their task. They painted in glowing colours the delights which the practice of heathenism so liberally showered around them, the free enjoyment which it allowed them of all their natural advantages of youth, beauty, and noble birth; and, contrasting with these the sufferings, the privations, the torments, to which the profession of Christianity exposed her, they entreated Dorothea, by the memory of their former friendship, to have compassion upon herself, and to return, as they had done, to the path in which all the enjoyments and delights of life awaited her. With noble dignity Dorothea rebuked the debased and sensual spirit which spoke in the solicitations of her friends, whose language resembled more that of a pair of wantons than of two virtuous maidens; then passing from her own case to theirs, and assuming a tone at once lofty and compassionate, as became her who had led them into the faith from which they had so miserably fallen, she implored them to consider for what they had forsaken the pure and holy service of the true God—for the worship of senseless images of gold, silver, brass, and wood, unable either to hurt or protect them, or, if there were living and powerful beings whom these images represented, yet beings so vile in character, so debased by every licentious and degrading passion, that they themselves would rather die than follow their example. The two sisters had not a word to say in reply. Conscience-smitten and ashamed, they could only plead that affection for their father had overcome their better principle; but now, fired by the inspired eloquence and noble example of Dorothea, they resolved to return at once to the fold from which they had wandered, and to submit to any extremity of suffering, and even to death itself, rather than be tempted to forsake it again.

Meanwhile Artemia and her council were consulting as to the fate of Antoninus and Dorothea. Artemia was not of an ungenerous nature: she heard with much sorrow of Antoninus's illness, and not only directed that, if it was occasioned by his imprisonment, he should be at once set at liberty, but, desiring him to be informed that she forgave his rejection of her, she gave her consent to his union with Dorothea, should she renounce Christianity, and directed that, in that case, her property should be restored to her. While the council were rejoicing at this generous proffer, a messenger arrived to announce that Theophilus's daughters had succeeded in the conversion of Dorothea, and that they were just at hand, with the image of Jupiter borne before them. Theophilus could not restrain his joy, and entreated Artemia to bestow upon his daughters, for the service they had done, some sign of her princely favour. With graceful condescension she held out her hand to them, but they remained rooted to the ground where they stood. "What!" she inquired with much surprise, "do you refuse my favour?" "Let us first deserve it," replied Calista. "Right, my dear child," cried Theophilus, thinking that she wished to give proof of Dorothea's conversion; "set down the image—prepare the incense. Now, fair Dorothea, let me support you—kneel and pay your vows." "I shall do it better by their example," said Dorothea, quietly. "You shall have it," replied Theophilus, "they are familiar with the rite. Come, my daughters." "Thus, then," they

exclaimed together; and, spitting upon the image, they threw it upon the ground.

All stood amazed at this act, so daring—so unexpected. Theophilus was horror-struck, and for a moment unable to speak; but Harpax, who stood by his side, recalled him to himself by reminding him that now it was necessary he should act with promptitude and decision; that his daughters' impious act, unless at once atoned for, must be punished with death; and that the sacrifice would be more impressive, more effectual as an example, and more honouring to the gods, if offered by his own hands. Stung by the exhortations of Harpax, Theophilus turned to his daughters, and commanded them immediately to redeem the fearful crime they had committed, by falling on their knees, and suing for pardon of the offended deity. With firm composure they refused. Maddened by the recollection of the confidence with which he had counted upon their success in converting Dorothea, to whose superior power of persuasion they had themselves yielded, he sprung upon them, and drawing his dagger, laid them dead at his feet. Dorothea was hurried away to immediate torment.

Dorothea endured her torments with heroic constancy, and at last, when the ingenuity of her tormentors was exhausted, she was led out to execution. Antoninus, who still continued in a deplorable condition, would not be restrained from being present to look for the last time upon her who was so dear to him. With sweet serenity she addressed her murderers, telling them of the bright abode to which they were hastening her, and of the heavenly fruits which grew there. Theophilus in derision begged that, when she reached the place she spoke of, she should send him some of that fruit, while Antoninus, in the anguish of his heart, implored that he might be permitted to die with her. While they were speaking, Angelo entered; no longer a boyish page, but in his true form, a bright and glorious angel. He was visible only to Harpax and Dorothea; to Harpax, who was no man, but an evil spirit, and who was smitten with the torments of hell at the sight, and rushed distractedly from his presence; and to Dorothea, who looked with amazement on the change in the appearance of her page.

"Thou glorious minister of the power I serve!"

She thus addressed him,

"(For thou art more than mortal,) is't for me,
Poor sinner, thou art pleased awhile to leave
Thy heavenly habitation, and vouchsafest,
Though glorified, to take my servant's habit?
For, put off thy divinity, so look'd
My lovely Angelo."

"Know," replied the angel, "I am the same;

And still the servant to your piety.
Your zealous prayers and pious deeds first won me
(But 'twas by His command to whom you sent them)
To guide your steps. I tried your charity,
When in a beggar's shape you took me up,
And clothed my naked limbs, and after fed,
As you believ'd, my famish'd mouth. Learn all,
By your example, to look on the poor
With gentle eyes! for in such habits, often
Angels come to mine. I never left you,
Nor will I now; for I am sent to carry
Your pure and innocent soul to joys eternal,
Your martyrdom once suffered."

He then told her that whatever she now asked would be granted. With many thanks, she preferred two requests. One, that the love of Antoninus for her, in which he languished to death, might be changed to the love of heaven; the other, that when she reached her heavenly home, she might be permitted to send to Theophilus some of that sacred fruit which he had jeeringly demanded. Angelo promised that both requests should be granted. Suddenly Antoninus feels himself restored to strength; his whole soul is filled with a glow

of sacred fire; and, walking to where Dorothea stood bound, he knelt down and kissed her hand—no longer with the feeling of earthly love, but with the reverence of a pilgrim to a shrine. By the governor's command he is pulled away from her. Dorothea's head is placed upon the block and struck off with the word. "O take my soul along to wait on thine," cried Antoninus—and with the words sunk dead by her side. * * *

Theophilus was sitting alone in his study, reflecting upon the success which had attended his efforts to put down Christianity, when suddenly a youth, in form and appearance resembling the page who had attended upon the martyred Dorothea, entered his room, and presented him with a basket full of fruit and flowers, telling him that Dorothea sent him these from the garden in which she now dwelt, and then vanished. Full of amazement, he called his attendants, and inquired how the boy had gained admittance; but none of them had seen him enter, and the doors had all been locked. The scent of the flowers was more exquisite than anything he had ever before felt; and, as he inhaled it, filled him with a peaceful serenity such as his soul had long been a stranger to. He then began to taste the fruit, when Harpax rushed into the room, not now in the humble guise of secretary, but in his true and fearful shape, a fiend, with fire all flashing around him, and commanded him to forbear; telling that he was now his slave, and must obey him. Theophilus, though sorely frightened, continued still to eat, and, as he ate, found his strength and courage increase. The fiend threatened to tear him in pieces unless he desisted, but, as Theophilus perceived, durst not approach to where the basket of flowers lay. While they were thus contending, Theophilus, thrusting his hand to the bottom of the basket, took out thence a bundle of flowers wreathed together in the form of a cross. At sight of this the fiend fell to the ground, howling with agony. Theophilus still held it up before him, until at last, unable to endure the sight any longer, he vanished away.

Theophilus now became as zealous a Christian as he had been a cruel persecutor. He sent and released from prison all who had been imprisoned by his orders, furnishing them with means to make their escape from Cæsarea. He did not himself long escape the fate which he had before inflicted on so many others. After suffering unheard-of torments, he received the glorious crown of martyrdom.

Artemia consoled herself for the loss of Antoninus by bestowing her hand upon her father's colleague, Maximinus; and Dioclesian, full of rage at the defection of his officer, issued orders for a simultaneous persecution of the Church throughout every corner of the empire.

I must repeat to you an opinion I have long held, that no man had ever more than one conception. Milton emptied his mind in the first part of *Paradise Lost*; all the rest is transcript of self. The *Odyssey* is a repetition of the *Iliad*. When you have seen one Claude, you have seen all. I can think of no exception but Shakespeare; he is always varied, never mannered.—*Archdeacon Fisher.*

N.B. The Second Volume of this Periodical is now ready; covers for binding, with Table of Contents, may be ordered of any Bookseller.

A SCOTTISH SCENE.

A SCOTTISH SCENE.—(See Illustration.)

"As they neared the land, the hills appeared to recede from them, and a little valley, formed by the descent of a small river from the mountains, evolved itself, as it were, upon their approach. The style of the country on each side was simply pastoral, and resembled in appearance and character the description of a forgotten Scottish poet, which runs nearly thus:—

'The water gently down a level slid
With little din, but couthy what it made;
On ilka side the trees grew thick and lang,
And wi' the wild-birds' notes were a' in sang;
On either side, a full bow-shot and mair,
The green was even, gowany, and fair;
With easy slope on every hand the braes,
To the hill's feet, with scatter'd bushes raise;
With goats and sheep aboon, and kye below,
The bonny banks all in a swarm did go.'—SIR WALTER SCOTT.

THE ATMOSPHERE.

IN how many shapes does atmospheric influence present itself! In the brightness of a summer's morning we feel refreshed and delighted by the invigorating buoyancy of the air, and listen to the pleasant sound of the merry breeze, as it stirs the forest leaves, or ripples the surface of the lake. The countless forms of life around us,—feathered and insect tribes making the air their home,—animals upon and in the earth, and the uncounted tenants of ocean,—all depend for existence on the agency of the atmosphere. The vegetable kingdoms, also, own their dependence on this mighty agent, which, covering all regions of the earth, is felt in every land, and by all orders of being. Let us then consider some of the most interesting circumstances connected with the atmosphere.

It is principally composed of two gases, oxygen and nitrogen; but, as two other elements, carbonic acid gas and vapour, enter into its composition, we shall consider it to consist of these four substances. The chief gas is nitrogen, as, in 100 parts of the atmosphere, nearly eighty consist of this element, which is sometimes called *azote*, a term indicating its life-destroying properties. Four-fifths of that air, without which we must all perish, is therefore a most pernicious element. Thus vital and deadly gases are so beautifully mingled as to produce that life-sustaining fluid which every where girdles the earth, and invests it with countless forms of loveliness. Carbonic acid gas is also destructive to life; but this and the nitrogen are so adjusted to and worked up with the oxygen, that we gladly breathe the pure compound, and require it more constantly than any other nourishing agent. Before proceeding further, we must give the proportions in which these four substances exist in atmospheric air.

If we take 100 cubic inches of air, and analyze the mass, we shall find it to consist of the following proportions:

Nitrogen gas	= 77.5 or 77½ inches.
Oxygen gas	= 21.0 "
Vapour	= 1.48 1½ "
Carbonic acid gas	= 0.03 ⅓ of an inch.

These are the proportions nearly, by measure or bulk; but if 100 grains of air be taken, the following table then exhibits the respective elements:

Nitrogen gas	= 75.55 or 75½ grains nearly.
Oxygen gas	= 23.32 23½ grains.
Carbonic acid	= 0.10 ⅓ of a grain.
Vapour	= 1.03 1⅓ grain.

Thus it will be seen, that both by *weight* and *bulk*, the principal elements of the atmosphere are nitrogen and oxygen gas, the vapour and carbonic acid gas forming only about one and seven-fifths of a cubic inch in 100 inches. It will be seen that the gases destructive to life are far more abundant than the vital gas; but the commingling of all produces a wholesome fluid. As we stated in the article on Water, oxygen gas is without taste, colour, or smell, and so is the atmosphere. Nitrogen possesses the same properties, though differing in other respects. Carbonic acid gas is found in mines, where it causes the choke-damp; vast quantities are also locked up in limestone, a cubic yard of which has been calculated to contain 16,000 cubic feet of this gas, which some suppose to have formerly existed in immense quantities in the ancient atmosphere of the earth. Were the air wholly composed of oxygen, animal life would be hastened in all its movements, and, probably, speedily exhausted; whilst an atmosphere of nitrogen, or carbonic acid, though favourable to some forms of vegetable and animal life, would have rendered the earth unfit for man and terrestrial beings.

The mingling of the different gases in the atmosphere is a matter calling for our attention and admiration. Were each permitted to arrange itself according to weight, we should have an atmosphere composed of three distinct strata, the lowest being carbonic acid gas, the next oxygen, and the third nitrogen gas. This is the arrangement we should have expected the fluids to take by the natural laws of gravity. In such a disposition, the earth would have been a silent expanse; vast forests might have covered its surface; but no sound of life would have arisen from vale or mountain. But this tendency to accumulate in strata, according to the weights, has been checked by another law, by which these various gases are so mingled together, that the carbonic acid, which would naturally have fallen to the surface of the earth, is diffused through the whole atmospheric mass, and does not compose more than the ⅓ part of the air. This tendency to diffusion is of vast importance in our towns and dwellings. Take a factory, with 500 men working there for eight hours; in that time 6,000,000 inches of carbonic acid is given off by respiration; were that product to accumulate, day after day, in our streets, depopulated cities would soon bear witness to its destructive qualities. The tendency of the gases to mingle prevents

these results. The gaseous proportions given above are nearly the same in every part of the globe,—a fact illustrated by the experiments of the most eminent scientific chemists, who have analyzed the atmosphere in different climates, with the same general result. Some, however, have supposed that oxygen is more permanently abundant in some places; an opinion which has not been confirmed by experiment. But it may be said, that, if the atmosphere is every where composed of the same proportion of its gases, it ought to be equally healthy in all places, and the air of Sierra Leone as bracing as that of Devonshire. It must be remembered, however, that many circumstances combine to prevent, in some regions, the natural diffusion of the gases, or *retard* their mixture, from which it follows that some disturbances must happen in the animal economy. Thus, in a hot and thickly-wooded country, the free circulation of the air currents will be prevented, the atmospheric tide will not, so to speak, ebb and flow with due regularity, and a deleterious gas, such as carbonic acid, will take a longer time to diffuse itself, and is in the mean time breathed by animals. But, in all such cases, the *natural tendency is to mingle* in the proportions given above; such, therefore, may be considered the proper elements of the atmosphere. Every one knows that the quantity of vapour entering into the air must vary at different times, being much greater in hot than in cold weather, the difference being as $\frac{5}{16}$ to $\frac{1}{16}$; but there is, nevertheless, an average quantity of such vapour mingled with the atmospheric gases, which is the proportion expressed in the tables. A similar remark applies to carbonic acid gas, the amount of which in the air is not always the same, being greater in dry seasons, but the moistened soil and saturated vegetation of a wet summer imbibes it largely from the air.

Was the atmosphere always supposed to be a *compound fluid*? No; men had breathed it for thousands of years without suspecting its compound character. Nor was it likely the viewless air should be deemed a complex fluid, when water, a more tangible and evident substance, was so long deemed simple.

Until the year 1774, men were ignorant of the constituents of the atmosphere; but Priestley then obtained a glimpse of the truth in perceiving that oxygen entered into its composition; whilst Scheele, Lavoisier, Berthollet, Cavendish, and a host of enthusiastic students of Nature, soon gave to the world a true interpretation of many beautiful laws relating to the atmosphere. Into the history of these discoveries we cannot enter, nor wander into the rich and wide regions which on every side present their pure beauty to the eye, but confine our observations to the facts presented to our view in the atmosphere itself.

The height of this world-belt cannot, of course, be ascertained by actual and close observation,—the loftiest summits of the Andes do but pierce through the first stratum of air; nor has any aéronaut ever penetrated to its remoter depths. We are, nevertheless, able to make a tolerable guess at the depth of this gaseous sea which surrounds us, and forty-five miles is usually regarded as the height to which our atmosphere extends. One means by which we arrive at this calculation is, the reflection of light. The process may thus be described: suppose we observe a certain portion of light from the sun arrested by vapours, and reflected to the earth, instead of passing in straight

lines through space,—and that the reflecting vapours are forty-five miles above the surface of the globe; we naturally infer the existence of a supporting fluid, where those vapours float, and therefore conclude that our atmosphere extends to such an elevation. Some give to the air an altitude of fifty miles; but nothing like exactitude can be expected in calculations respecting a fluid, the density of which is exceedingly rare at great heights. Meteors have been observed sixty or a hundred miles above the earth; but it does not follow that such bodies must always take fire in the atmosphere,—they may be exterior to it; no conclusion can therefore be formed respecting its extent from these phenomena. When, however, we represent the atmosphere as having an elevation of forty or fifty miles, it is not intended to assert that it maintains the same properties throughout the whole range; this is far from being the case. The density, for instance, must diminish with every mile of elevation, until at last a state of the greatest rarefaction is produced. Thus, at very slight heights, the air is too thin to admit of free respiration, and the discharge of a gun is scarcely heard, from the slight resistance offered to the exploded gas. If we ascend to the summits of the Andes or the Alps, and discharge a gun on the top of Chimborazo or Mont Blanc, the report is scarcely equal to that of a child's pop-gun,—so small is the resistance of the air at such heights. At an elevation of three and a half miles, the density of the air is one-half that upon the surface, a fact which can easily be tested, as aeronauts have attained to such heights; at fourteen miles it is reckoned at one-sixteenth.

Were the density preserved the same through the whole height of the atmosphere, the pressure would far exceed that which now weighs down with a force of fifteen pounds every square inch of the globe. This would occasion a corresponding change in our bodies, the temperature of our climates, the growth of vegetables, and in the whole organized world. We should be bowed down by an ever-crushing weight; no flower would raise its delicate head above the ground, whilst every gale must become a furious and destructive tempest. On the other hand, were the atmosphere at the same density from top to bottom as at the height of seven miles, we should not be able to exist; the blood must become corrupted; no refreshing breezes ever felt; and, in all probability, a perpetual winter would rule over the earth. All these consequences are prevented by the present adjustment of the atmosphere, by which the parts nearest the earth are of the density requisite for the support of animal and vegetable life, and the portions above so gradually attenuated as to keep the whole atmospheric machine in perfect order. This attenuation of the air has no assignable limits, but continues to increase the higher we go. It has been calculated that a cubic inch of our air, taken from any part of the earth's surface, would become so expanded at the height of five hundred miles, as to fill a space equal to the whole bulk of the planet Saturn. Thus the atmosphere may be described as a series of numerous air-strata, diminishing in density as they ascend.

It is, perhaps, needless to remark, that the higher we rise the less is the pressure of the atmosphere upon us, as may be proved by the gradual fall of the barometer while ascending a

mountain. Let us suppose ourselves at the foot of some lofty hill; we observe the barometer, and perhaps find the column of mercury standing at thirty inches high; we begin the ascent, and, having gained an elevation of some hundred yards, again observe the instrument; the quicksilver has fallen. We again proceed; the fluid still continues to fall the higher we rise. • This results from the diminishing pressure of each more elevated stratum of air upon the mercury in the bowl of the barometer; the metal therefore falls in the tube and rises in the bowl. If we descend, the increasing aërial pressure forces the fluid from the receptacle into the tube again. The uses of this atmospheric pressure are various: it prevents the water of seas and rivers from being too rapidly evaporated by heat, which would cause an undue saturation of the air, and the production of a perpetual rain.

It also enables us to heat water to a much higher degree than we otherwise could, as it now preserves the fluid form until heated to 212° of Fahrenheit's thermometer. Were the pressure of the atmosphere much less, water could not be raised to such a temperature, but must be turned into steam before fitted for many of its present purposes, in the preparation of food, and manufacturing operations.

The common pump depends upon this atmospheric pressure. When a child sees water issuing from the spout of a pump, he imagines that the water is *raised by the action of the handle*, drawing up the contents of the well: and such may be the notion of many very old men too. In fact the water is not drawn up at all: the air is pumped out of the pipe, and the water rushes in to take the place of this fluid. Why does the water rush up the empty pipe? It is forced upwards by the pressure of the air in the well on its surface, and rises to the height of about thirty-four feet, above which the common pump will not raise water. Thus the construction of this domestic machine depends upon the universal and unchanging laws which rule the atmosphere.

This effect of aërial pressure was long ascribed to a peculiar property supposed to belong to all matter, and which was called nature's *dread of a vacuum*. When, it was said, air is withdrawn from the pump-tube, the surrounding water rushes in to fill the vacancy, *because nature abhors emptiness*. We should say, because it is forced up by the pressure of the superincumbent atmosphere; and we are right. Let us not, however, fall into the silly habit of ridiculing the men of olden times for their ignorance in these matters; they gave the best explanations in their power of the phenomena around them, and we can do no more; but our opportunities for observing Nature working in her secret places, and dealing with her strange mysteries, are superior to theirs; let us rejoice for ourselves, but forbear from insulting those who gazed from a valley at the objects which we calmly survey from high mountain summits. The atmosphere may be reduced by means of the air-pump to any degree of rarefaction, even to three hundred times less than its usual density. This is not surprising, since if a cubic foot of air be in a vessel, and the air pump applied, 299 parts may be pumped out; when the 1-300th part will still attempt to fill the vessel. However small the quantity left in the receiver, it will attempt

to occupy the whole space, but its effects are then so trifling as to be inappreciable.

Air is not only capable of such extreme rarefaction, that no instruments can detect its presence, but will take a liquid form. To accomplish this result it must be subjected to *vast* artificial pressure, amounting to 30,000 lbs. on every square inch. This state of condensation is, however, wholly artificial, and never exhibited in any natural operation, the greatest pressure being that which we feel on the surface of the earth. Liquefaction of the atmosphere cannot therefore be a natural result.

The peculiar conformation of the atmosphere has a strong influence upon the laws of vision, and the phenomena of light. When we walk abroad in the early beauty of a summer's morning, we see a thousand objects from the hill top, which we have climbed for the sake of the prospect, and a softly-diffused light invites the eye to scan plains, hills, forests, rivers, and the distant sea, with its playfully agitated waters. The atmosphere is *fitted* to receive light; there is, therefore, a peculiar relation, a species of brotherhood, between the air and light, by which they act in concert, one adapting itself to the other. Suppose the atmosphere were so constituted as to resist light, to prevent its reflection, or refraction, or to separate it into its different colours, how altered would be the aspect of all things! A bright overpowering glare, a dazzling kaleidoscopic earth, with a sharp and painful light, would be our lot, instead of the beauties which now gladden the eye and exalt the taste.

What a powerful agent is the atmosphere in the production of *sounds*! without it the globe might abound with living myriads; but silence, the sign of death, would be the law of all existence in earth and air. Those numberless sounds from the world of rejoicing insects, the fine and touching harmonies of birds, the solemn echoes of woodland voices, and the deep tones of the water-fall, would be unknown. What a singular change in our mode of life, the matter of our thoughts, and the nature of language, does this suggest! Thus we see how closely our present mode of being is linked to certain particular arrangements of two or three invisible gases, and how fluid matter is made the medium of intercourse with our fellow-creatures, and with the most impressive forms of natural beauty. How various are the results thus produced from one agent! life supported, vegetation upheld, rivers and seas kept in their channels, light and sound made vehicles of delight and interest; all by the duly-adjusted workings of a fluid which attracts not the notice of one-tenth of those living in the very sight of its wondrous agency, and beneath the most direct manifestations of its sublime power.

This atmosphere is not a quiescent mass of stratified air, but active as the ocean, and perpetually excited by numberless currents blowing in every direction, and at all elevations. Every peasant, though bookless and unlearned—every school-boy, though regarding the rule of three as the limit of science, has a knowledge of those movements, which, in breeze, storm, or hurricane, roll their aërial waves through the lower regions of the air. But vast tidal streams—the Mississippi of the atmosphere—are perpetually flowing in the higher regions; some sweeping from the equator towards the poles, others heaving their invisible billows towards earth's central line. Besides these

movements, there are multitudes of minor ebbs and flowings, by which the salubrity of the globe is preserved, and numerous meteorological phenomena produced. When we gaze into the clear blue deeps of the sky, all seems still in that expanse; a thousand wonderful movements are, nevertheless, continually operating in these seemingly passive regions. Common observers may often notice these diverse agencies, and especially the different currents of air setting in opposite directions. Frequently, when we feel a breeze blowing towards one point of the compass, the clouds are seen to move in the opposite direction, intimating the existence of a contrary current at that elevation; whilst, higher still, other atmospheric rivers are distinguished, bearing along their light cloudy films. That all such movements are necessary to the accurate working of the great machine—that each is under the control of well-devised and harmoniously-acting laws, we cannot doubt, though such agencies are yet hidden from the scrutiny of our philosophy. When these hidden mysteries of the atmosphere become known in their full significance, we shall see the wisdom and love of the Deity as beautifully developed in the movements of the air as in the courses of the stars.

Let us now consider the atmosphere as supplying to the human frame those gases which feed the ever-active flame of life within us, by furnishing, from the first to the last moment of our earthly existence, a constant supply of air to the lungs. The vital energies in each human body may be likened to a furnace, which requires an incessant supply of fuel; part of this fuel is supplied by the oxygen extracted from the air by the beautiful agency of the lungs. This singular machine consists of two soft divisions, called the right and left lobes, and is composed of countless air-cells and blood-vessels, the latter of which penetrate every part of the former, in order to expose the blood within them to the action of the air. Were the blood injected into the lungs in *one* mass, much of it must remain beyond the influence of the air; the surface alone would experience its agency. To secure the exposure of every portion of the blood to the aerial influence, it was necessary that it should be subdivided into minute tubes, around which the freshly-inhaled atmosphere may readily press. Few are aware of the vast extent of lung-surface thus exposed to the air in consequence of its division into these passages and channels, an area which some reckon at 150 square feet. To cool such a surface requires an immense quantity of air, and the lungs are accordingly fitted to hold above 300 cubic inches, which are drawn in through the nostrils incessantly. What quantity of air is required daily for one man? Let us suppose that twenty inspirations are made every minute; that forty cubic inches are received into the lungs by each of these efforts; this will give 800 cubic inches of the atmosphere to support breathing for one minute only. Thus a man requires each day of his life 1,152,000 cubic inches of wholesome air. From this constant inrush of a cold fluid to the lungs it happens that they are the coolest part of the body. But how is this vast quantity used up? through what process does it pass? This air is but the raw material, so to speak, which is to be worked up by an elaborate system of machinery.

The air is useless to the vital system in the shape in which it exists around us, and in which it

is drawn into the lungs: it must undergo a peculiar process before it becomes fit for use. This process consists in separating the oxygen from the rest of the atmosphere, and this gas, when so extracted, is instantly mingled with the blood in the numberless vessels of the lungs, and by it carried away to all parts of the body, where it is quickly consumed by the mysterious furnace within us. The weakened blood again seeks a fresh supply of oxygen from the store-house of the lungs, and thus the circle of life moves. When the exhausted blood returns to the lungs for fresh food, it has a deep purplish hue, but, having received the oxygen, it rushes off on its errand, exhibiting a brilliant scarlet tint. How does the oxygen reach the blood? Through the thin membranes of the vessels, which are, in some cases, not more than a thousandth part of an inch in thickness. These delicate tubes are spread, like a system of the finest net-work, about the air-cells of the lungs, and by such exquisite agencies the great business of life is carried on.

The nitrogen of the air is not used by the lungs, and is therefore returned, by respiration, to the atmosphere around us; thus, with a nice discrimination, the vital gas is separated from the noxious; the former being instantly absorbed, the latter rejected. Carbonic acid gas, a fluid most destructive to animal life, is formed by breathing. For the oxygen which has been separated from the atmosphere, and united with the blood, does not return to the air, but carbonic acid gas is formed by its combustion, which is given out in large quantities by respiration, and vitiates the air around. When it is considered that 40,000 cubic inches of this deleterious gas are respired by one man every day, it will be seen how pernicious a long confinement in close rooms and crowded factories must be to the human constitution. In such places the air soon becomes noxious by the carbonic acid poured into it, and, unless a good system of ventilation exist, the lungs will be gradually poisoned, the blood deprived of its vital energies, strange diseases commence their attack on the constitution, and consumption slowly urge its victim to the grave. A man may exist in health on the simplest food, and on surprisingly small quantities; but diminish his proper supply of oxygen, and death begins to work.

All classes of the animal kingdom depend for existence upon the atmospherical influences; some requiring more air than man, as birds, others less, as reptiles. Fish procure oxygen from the water by the gills, which are complicated machines adapted for this purpose.

Some have imagined that certain reptiles are able to exist without a supply of air; and strange stories are recorded of toads, shut up for ages in the solid rock. But many of these reports rest upon suspicious authorities, and are weakened by certain experiments recently made to test this presumed vital capacity of the toad. In the year 1825, Dr. Buckland enclosed twelve toads in holes, cut in hard sandstone, but all died within a year. Dr. Macartney also found that a week's separation from air sufficed to destroy life in a toad. Thus it seems unlikely that these animals can exist for long periods without air, in the manner described by some marvel-mongers.

Our conclusion is, that the atmosphere contains an element essential to the support of life, and wherever living creatures are found, deep in the ocean-waters, or beneath the earth's surface, there

in some shape this fluid must be. Thus, let us look upon the viewless air around us in all its beautiful adaptations to human wants,—as a mighty girdle bending down by its pressure the surface of the globe—as the diffuser, by refraction and reflection, of the light from sun, moon, and the bright starry host—as the storehouse and fountain of the winds, breathing beauty in their passage over the earth—and as the great supporter of vegetable and animal life. Such is that air which the child feels stealing amid his wavy locks as he gambols over the meads, which the philosopher sees working in a thousand mysterious ways, and which is one principal cause of the sublimity and beauty visible on the face of creation.

A CHRISTMAS PARTY IN THE COUNTRY.

CHAP. I.

"SNOW, SNOW, SNOW! I can tell you, Miss Sophy, there will be nothing but snow to-day, you may depend upon it," said Charles Loraine to his eldest sister, as he looked out of the window of the saloon at Kirkfield, "so there will be no drive to R—, and Justine will be sadly disappointed. You will have to amuse her as well as you can, for Fred and I shall go down to the low-close to look after the snipes, in spite of the snow." "I am afraid you are right," replied Sophia, "the snow certainly looks set in for the day; but I have no fear of being unable to amuse my cousin at home, for we ladies always find plenty to do." "And plenty to talk about also," said Charles, laughing; "only, Justine talks so much about persons whom I do not know, and so little about things which I do know, that, pretty as she is, I should be sorry to be shut up the whole day with her."

"Why, my dear Charles, you forget that Justine has passed all her life in London and Paris, and everything in this quiet corner of the world is new to her. She has even our language to learn as well as our customs, so you should not be too hard upon her, for I doubt not, by the time she can understand our northern dialect, she will find an interest in all our pursuits. I do wish, however, that she would contrive to rise a little earlier. Every body else seems to be assembling for prayers, and the bell has been rung some time." "Yes; and there goes my father with his little 'tinkle, tinkle,' at the bottom of the stairs. Well done, 'little impatience,' as Agnes calls it, you will not rouse Justine."

Whilst the party are joining in their morning duty, let me ask my readers if they were ever at Kirkfield. I suspect not, for it is some miles distant from any of the great roads, and, though I have before intimated that it is in one of the northern counties, I do not intend to point out the exact locality. The village of Kirkfield is extremely rural, consisting of a number of cottages surrounding an extensive green, in the middle of which are two or three magnificent spreading elms. The title of cottage may properly be applied to every house there. None is so wretched as to preclude the idea of comfort. Some few of the better class are really pretty; yet even the parsonage, which is conspicuously placed at one end of the village, is still a cottage, though a cottage ornée. Peering above the profusion of lilacs and laburnums which grace the parsonage garden, rise the aristocratic gates which lead to the Hall, with a pretty low-roofed lodge, covered with climbing roses, and inhabited by old Emma, whose business it is to open the gates, and tend the chickens which are reared within the green wire fences. Old Emma! Young Emma, blooming Emma, sweet Emma, we have often heard of—but, old Emma! There seems something incongruous in those oddly joined words. Who can hear them, and see the pale, withered, time-worn face which they

indicate, without a reflection that she, too, may have been sweet Emma, must have been young Emma; and that years, which slip away so noiselessly, will at last bring to them, young though they now be, the falling step, the wrinkled skin, and the dimmed eye of age? Happy will it be for them if, like old Emma, they can look back upon a well-spent life, find their present comfort in the spectacled perusal of the word of God, and their future hope in the promises which are there held out. Few are the visitors to Kirkfield Hall who do not exchange a kindly greeting with old Emma before they proceed along the green pathway of the terrace, which leads, for nearly a mile, from the gates to the house. This terrace is beautifully planted with a variety of well-grown trees, amongst which, here and there, an opening is cut away, which allows the eye sometimes to wander over the pretty little park, dotted by fine cattle—sometimes to catch a glimpse of the bright silvery stream which runs below, and at length to rest upon the house itself, and the ancient ivy-covered tower of the church, which, placed absolutely in the grounds and close to the mansion, seems to look down upon it with a calm air of holy protection. From the north side of the house there is no view but the immediate one of the well-wooded and grassy slope of the terrace, but to the south the scene is more extended. The windows of the saloon, which, with the dining-room at one end, and the drawing-room at the other, occupies the whole of the south front, look out upon a flower-garden, with three gently declining terraces sinking to the edge of a bright sheet of water, where, as on St. Mary's lake, the swans

"Float double, swan and shadow."

A light Chinese bridge crosses this water, and leads into the park, just where the tiny lake dwindles into a stream; and along the west side of the park the great terrace extends its shelter. Far away to the south stretches a fine champagne country, whilst to the east arises a lovely range of hills, of various shapes and sizes, some low and grassy, others woody, and some few covered with purple heath, and almost claiming the loftier name of mountains.

Such is a summer description of Kirkfield; but we must not forget that it is now winter, and that we have left a large Christmas party assembled in the breakfast-room. Seldom, indeed, was Kirkfield without a large party. The Loraines were themselves a numerous family, and Mr. and Mrs. Loraine loved to assemble around them a happy group of friends, to share in the amusements of the young people.

Justine made her appearance soon after breakfast had commenced, and blushed a little when her uncle complimented her upon her early rising. Though she certainly was disappointed on finding the drive to R— must be entirely given up, she not the less cheerfully took her place with the working party round the fire at one end of the saloon, whilst another group were practising music or reading at the other end, and the younger ones ran from one fireplace to the other, keeping themselves warm by the exercise, and doing little offices of kindness for the elders. Mrs. Loraine and Sophia went to arrange the household affairs, Mr. Loraine to his cabinet and turning apparatus, and some of the gentlemen to the library. Charles and his cousin Frederic took up their guns, determined to brush through the snow, and wage war upon the snipes, accompanied by two youngsters who begged to act as pioneers. At noon came the post, that pleasant excitement in a country house, when Mr. Loraine's entrance with the letters and newspapers brought all around him full of hope—some to be gratified, some to be disappointed.

"One, two, three letters for mamma!" exclaimed Agnes, "what can they all be about? One for Rosaline, which I do believe is from Maria! One for Mrs. Barlow! There, Laura, run with it to your mother! Two for you, Justine! Only look at this

lacework border, and the direction—*a Madlle.—Madlle. L'Estrange!* that must be a French letter—” And so the merry chatterer ran on till arrested by an epistle addressed to Miss Agnes Lorraine, “from dear, dear Edmund!” when the happy sister was soon absorbed in all the details of a midshipman’s journal.

How delightful to children is the first letter they receive! How delightful, when young, is it to receive any letter at all! Who does not recollect some treasured epistle arriving on his birth-day from a kind aunt or godmother; some letter which dear papa had written during a short absence, which was handed about to all in the parlour, pressed upon the notice of every morning visitor, and read over and over again by nurse, until the proud receiver could repeat every word, and cheated himself into the belief that he was reading all that met his unpractised eye. How different his youthful feeling from that which, in after life, too often attends the receipt of a letter; when we linger with it in our hands, afraid to open it lest it should bring tidings of grief; when the postman’s horn sounds heavily to the heart of an anxious parent, and he dreads to see the handwriting of his estranged and ungrateful, though still loved child, sure that it only solicits supplies for extravagance, or speaks of the penitence which he dares not believe sincere!

The post came in good time to relieve something rather like ennui, which had been creeping over some of the party; and inquiries after absent friends, and discussions upon public events, gave a flow to the conversation until the dinner-bell brought back the shooters, wet and weary, with little booty but large appetites. Alceyn and Neville were loud in asserting the use they had been of to Charles and Fred; and both boys longed for the time when they might prove their own superior skill by handling the guns themselves, though they allowed it was hardly possible to take fair aim with a thick snow falling around.

“Only think, Frederick,” said Justine, after dinner, “I have had a letter this morning from Natalie, and she tells me there have been the most lovely things come out for *Le jour de l’an*, and they have been so busy choosing them. I do wish I had been there.”

“A very pretty compliment to the present company,” said Charles; “you would leave us all for a new-year’s gift of sugar plums.”

“A new-year’s gift of sugar plums! Justine, do grown-up people like you have sugar plums in Paris?”

“Yes, Agnes; they are so pretty you would be delighted with them if you could only walk along *Rue de la Paix*, and peep into all the confectioner’s shops. There are all sorts of things in sugar: roses with dew-drops; grapes and plums with the bloom on; and a thousand strange fantastic shapes, which none but a French *artiste* would think of making in confectionary. Quite poetical, I can assure you, when compared to the huge twelfth-night cakes, which you see stuck all over with little kings and queens in blue and red in the shops in Regent Street. Do you not remember, Fred, the splendid bouquet Madame de Bignon had last year, all presented to her by different friends on *Le jour de l’an*? M. de C— brought a crown imperial, Louis a splendid ixia, and M. de V— the most wonderful stapelia, so true to nature that it absolutely seemed to smell abominably.”

“Pugh!” said Charles, “that was not poetical, however.”

“*Mais pourquoi?*”

“*Pourquoi!* Why, because a poetical idea always seems to me to include the most beautiful view of nature; a poetical mind, to be that which will rest with most pleasure on the lovely in sights, and sounds, and smells; or if the objects it chooses to represent are not absolutely lovely in themselves, at least they recal, by their associations, those feelings which refine or ennoble our nature. But the smell of a stapelia! I dare say Don is just rejoicing over a similar treat at this moment.

Come with me, and try if the dog-kennel will remind you of Parisian joys.”

“Nay, nay, Charles,” said Mrs. Lorraine, “you are rude to your cousin. I do think a prettier device than flowers could hardly be found. What is the fashion this year, Justine?”

“I fear Charles will find still greater fault in it, for Natalie says it is insects, and tells me of some superb cockroaches and spiders.”

“Horror upon horrors!”

“Surely,” said Rosaline, “insects may fitly follow the flower. How pretty a bee would look placed upon them!”

“Where the bee sucks, there lurk I;
In a cowslip’s bell I lie.”

“Come along, Rose,” said Cyril, “I have not heard that dear old song since my return to old England, and I have been studying so hard all the morning that I feel I deserve a little treat. What has Lucy been doing? Lucy, have you copied my superb sketch of the entrance to the Hooghly, and put all the streamers flowing the same way?”

“Sophia,” said Charles, “I have had no time to ask after the Flora Kirkfieldensis which you were so busy about during the long vacation. How many more flowers have you painted? Where is your portfolio? Pray let me look at them. And how is the hortus siccus?”

“Oh, Justine!” said Agnes, “if you are fond of flowers I am sure we may look over the hortus siccus to-night, and perhaps you will assist Sophia and Lucy to arrange it, will you?”

“I am very fond of flowers, and will do my best to help them, but I am no botanist. I learned botany at school, to be sure, but the terms were so very hard I soon forgot them, and flowers are so very dear in London I never thought of it there.”

“Oh, that is a pity!” said her little cousin, “but you will stay with us until summer comes, and we have thousands and thousands of flowers here.”

“I dare say you have many, for the garden seems large, and the green-house full of plants.”

“Oh, we don’t botanize with garden flowers. Look! all Sophia’s drawings are from field-flowers, and they are very, very beautiful.”

“Indeed, some of them are very pretty,” said Justine, turning over the portfolio; “but are all these field flowers? I had no idea there were so many.”

“I have only painted about a hundred yet,” said Sophia.

“Only a hundred! I should not have believed you could have found so many. Where do they grow?”

“Everywhere,” said Lucy, laughing; “on every bank, and under every hedge-row. Only remain with us, my dear cousin, until spring brings back our pets, and you will be surprised how they spring up around us. The very first which appears in the beginning of February, just on the warm bank of the terrace, is the little celandine, opening out its pale golden petals. See, here is the drawing, and here the dried plant! The very sight of them makes me feel that first sigh of warmth which tempts the leaves of the lilacs and honeysuckles to unfurl, and fills the swelling buds of our darling horse-chestnut tree. Then, if we stroll beyond the park, we come upon the tussilage, tarfara, or coltsfoot; and, at the foot of the rocks which overhang the river below the mill, peep out the snowdrops, so tall, so elegant, so superior to those which come up in the garden, welcome though they be.”

“Lucy, you forget the beautiful tufts of snowdrops on the terrace; but I suppose those are only half wild, and have been planted there long, long ago.”

“Aunt Martha, were those snowdrops there when you were a girl?”

“I fear, my love, I must lower them in your estimation, when I confess to having planted many of them myself, though I think I love them all the better for seeing in them memorials of that happy time.”

"There," said Charles, "Aunt Martha is poetical, you see!"

"So she is," said Justine; "and I can willingly allow there is something very poetical in a snowdrop elegantly hanging its pensive head, and deserving its name by its snowy whiteness."

"Yes," said Sophia, "and how pretty its botanical name, *Galanthus*, derived from two Greek words, signifying, milk-flower."

"What do you call it in French, Justine?" asked Agnes.

"La Galatine is the proper name, but we also call it *Perce-neige*."

"How pretty! As pretty as snowdrop, for I have often watched it piercing through the melting snow, with its pale green sheath sheltering the shrinking bud."

"Well, we all agree in allowing the snowdrop to be poetical; but what can you make of coltsfoot or tussilage?" asked Frederic.

"Coltsfoot! coltsfoot! Why, what can be more poetical than a wild colt scampering about a pasture?"

"Nay, nay, Charles," laughed Sophia, "I will give up coltsfoot, for I really do not know its meaning, as applied to this plant; but I must plead a little for tussilage. Tussis signifies a cough, and the flowers boiled in milk are a very popular remedy for that complaint amongst the poor people here. I am sure you would think it poetical enough if you could see old Emma, on some fine sunny March morning, gathering its little sunlike flowers, which come up without any leaves, and stand erect, in full vigour, until their beauty fades, when they hang their heads, as if mourning for its departure. But, like a tender mother, who seems to renew her own youth in that of her children, when the seeds are matured, and ready to be dispersed, the stem rises again, exposing them to the breeze which is to waft them to a suitable soil. This is a most interesting example of the action of plants, which cannot be explained on mere mechanical principles."

"Well, with old Emma's aid, and a slight allusive glance at aunt Lorraine, Sophia has certainly made out a case for the poor plant; yet, I must confess, all these dried and shrivelled flowers have little interest in my eyes. There cannot be anything very interesting in a *hortus siccus*."

"Rosaline, when you and Cyril have lived long enough 'merrily, merrily under the bough,' pray come and hold forth on the poetical merits of a *hortus siccus*!" cried Alleyn Lorraine.

"What is that you want with Rose?" asked Cyril.

"Only some verses poor Rose wrote last year, on recovering from that very severe illness, which makes her yet look so delicate, and so unfit to sing with you much longer," said his mother. "Neither you nor Charles have heard them, I believe, so Alleyn shall read them to us, and then I have another poetical production which will be very appropriate."

"Is it Wordsworth's charming lines on my pet pilewort, the lesser celandine, as he calls it, mamma?" asked Lucy.

"No, no, Wordsworth's lines are to be found by searching his works; and I am sure Justine will allow they amply repay the trouble of the search, if she do not know them already."

"But what are the claims of Lucy's favourite to such a distinction?" inquired Frederic. "I am afraid I shall be in great disgrace; but I must say, did I not see the outlandish title of *Ranunculus ficaria* affixed to the drawing, and hear her call it celandine, which is a sweet-sounding word, I should have called it a buttercup."

"I quite agree with Frederic," said aunt Martha, "in disliking those outlandish names, and would like a buttercup to be a buttercup still."

"And so it shall, my dear aunt," said Lucy; "but this is not a buttercup, though I allow it to be of the

same species; and so is the splendid *ranunculus* of the florists, though the latter is a native of Asia. The botanical name, *ranunculus*, comes from *rana*, a frog, because many of the species grow in moist places, where those reptiles resort. One of the English names of the flower under discussion, is *pilewort*; and I believe that of lesser celandine is not generally recognised. There is another celandine, *Chelidonium majus*, which derives its name from a Greek word, signifying a swallow, as the flower is supposed to make its appearance at the return of that bird, and to continue in bloom only during its stay. But here are Rosaline's verses!"

"Alleyn shall have them to read," said Rosaline, "when I have reminded you of the many pretty names given to the common *ranunculus*—crowfoot, buttercup, kingcup, goldcup, and Shakspeare's 'cuckoo buds of yellow hue.' Nor must you forget the white water-crowfoot, with its most delicate flowers and round green leaves, floating on the pond, whilst those leaves which are below the surface adapt themselves so wonderfully to their situation, being, by the action of the water, branched out into various lobes or fibres, so as to resemble the leaves of *Hottonia*, or similar water plants."

"Come, come," cried the impatient Charles, "you are prosing, that you may not produce your poetry. Give it to Alleyn; and if he do not read it with proper emphasis, he must never presume to think of the pulpit."

Alleyn accordingly began:—

"Come from the fields and woods, sweet sisters, come!
The hours are lonely whilst your footsteps stray;
I hear your laughing voices nearing home,
I see you o'er the terrace bend your way.
Now you descend beneath the chestnut tree,
Waving the treasures you have brought for me!
What is the flower which marks your love to-day?"

"Whilst you are absent, do not think I mourn,
I have a solace 'mid my herbal's leaves,
In the flower-tokens which at each return
From your blithe rambles still my hand receives;
Yet do I watch along the park's green track,
Hailing the moment which shall bring you back
From the gay fields to which my heart yet cleaves!"

"These flowers, though dead, still speak of hope to me;
This snowdrop tells of that cold-smiling morn,
When by Sophia, in her sportive glee,
This earliest harbinger of spring was borne
To my sick chamber; a fair omen then,
That soon the vernal breeze should bring again
The glow of health to my frame, weak and worn."

"And soon I ventured in the sunny noon
To leave that chamber-prison, and descend,
Pacing with feeble foot the warm saloon,
Whilst my kind sisters on my steps attend;
And Lucy, from the verdant lap of May,
Brought the bright bird's-eye primrose, blooming gay,
Its beauty with the hawthorn bud to blend."

"Sisters, sweet sisters! I can meet you now
With firmer footsteps at the clear lake's side;
Already on my Agnes' sunny brow
The wreath of summer roses I have spied;
Her laughing eyes outrun her nimble feet;
Sisters, sweet sisters! here once more we meet,
And bless that Power who hath new strength supplied!"

"And when, to-morrow, from the ivied tower,
Which looks down blessings on our ancient hall,
Summoning the villagers at morning hour,
We hear the sabbath-bell repeat its call,
Once more I hope my voice with yours to raise,
In tones of humble prayer and heartfelt praise,
To Him who thus can re-unite us all!"

POPULAR YEAR-BOOK.

December.

DECEMBER still retains the original name assigned to it in the old Alban and first Roman Kalendar adopted by Romulus, in both which it was the tenth or last month of the year. Its appellation is composed of *Decem*, ten; and *imber*, a shower. It was consecrated by the ancients to Saturn, or, as some authors affirm, to Vesta, the daughter of Rhea; and in it the Romans held their Saturnalia. The Saxons termed it *winter-monat*, but after their conversion to Christianity, they then, "of devotion to the birth-time of CHRIST," named it *halig-monat*, or holy month, though this title, as we have before remarked, was originally bestowed by them upon September. They also called December *mid-winter-monat* and *giulerra*, i. e. the former or first *giul*. The Feast of Thor, which they celebrated at the winter solstice, was called *giul*, from *iol* or *ol*, which signified *ale*, and is now corrupted into *yule*.¹ This festival appears to have continued through part of January.

Brady remarks that the emblematical representation of December was that of an old man, with a grim countenance, covered with furs or a shagged rug, with several caps upon his head, and over them a Turkish turban, his nose red, and that and his beard "pendent with icicles;" at his back he carried a bundle of holly and ivy; and in one of his hands, which were in furred gloves, he led a *goat*, in token of the sun entering the tropic of *Capricorn*, or *wild goat*, on the 22d of this month. This was intended to mark the winter solstice, or "that period when the sun reaches its greatest decline, and is returning to its former altitude and influence," which the goat aptly typifies, that animal being not only much prone to climbing, which would denote the ascent of the sun, but his horns being, according to ancient hieroglyphics, emblematical of the heat naturally to be expected from such ascent. Spenser pictures December thus:—

"And after him came next the chill December;
Yet he, through merry feasting which he made,
And great bonfires, did not the cold remember;
His SAVIOUR'S birth so much his mind did glad.
Upon a shaggy bearded goat he rode,
The same wherewith Dan Jove in tender years,
They say, was nourished by the Idæan maid;
And in his hand a broad deep bowl he bears,
Of which he freely drinks a health to all his peers."

The alterations which occur in the face of nature during this month are little else than so many advances in the progress towards universal gloom and desolation. The day now rapidly decreases; the weather becomes foul and cold, and there are often violent storms of snow and wind, which latter sweep off the few remaining leaves from the trees. The vapourish and cloudy atmosphere warps us about with dimness and chilliness, and the fields are too damp and miry to pass, except in sudden frosts, which begin to take place at the end of the month. Amid all December's sombreness there are, however, some "lively spots and cheering aspects." "The furze," in the words of a pleasant writer, "flings out its bright yellow flowers upon the otherwise bare common, like little gleams of sunshine; and the moles ply their mischievous night-work in the dry meadows;

and the green plover 'whistles o'er the lea;' and the snipes haunt the marshy grounds; and the wagtails twinkle about near the spring-heads; and the larks get together in companies, and talk to each other, instead of singing to themselves; and the thrush occasionally puts forth a plaintive note, as if half afraid of the sound of his own voice; and the hedge-sparrow and tit-mouse try to sing; and the robin does sing still, even more delightfully than he has done during all the rest of the year, because it now seems as if he sang for us rather than for himself—or rather to us—for it is still for his supper that he sings, and therefore for himself."

The 21st of December is the shortest day of the year, when the sun is rather less than eight hours above the horizon. The grey plover leaves us on the first of this month. Such of the squirrels, water-rats, hedgehogs, and field-mice, as have not become torpid in November, now retire to their holes. The evergreen trees, such as firs and pines, with their beautiful cones, are now particularly observed and valued. Besides a few of the flowers of last month, there are the aconite and hellebore; and in addition to some of the flourishing shrubs, is the famous Glastonbury thorn, which puts forth its blossoms on the Festival of the Nativity. The scarlet berries of the holly, the branches of pyracantha, and the laurustinus, are now in great beauty. The mosses offer a most curious spectacle to the botanist. Lichens cover the ditch banks, and other neglected spots, with a leather-like substance, which in some countries serves as food both to men and quadrupods. Cattle and sheep require great attention in feeding and sheltering; sheep are usually left out in the fields, and, without care, might be smothered in the snow. The farmer is employed in thrashing, winnowing, sacking, and carrying the corn to market; and the gardener, in matting and protecting trees and plants from the cold, and preparing the ground for the toils of spring.

In the Alban Kalendar, December consisted of thirty-five days; Romulus reduced it to thirty, and Numa to twenty-nine; Julius Cæsar restored the day of which Numa had deprived it; and Augustus added to it another, which it has retained until now.

December 5.—St. Nicholas' Eve.

AN old writer relates that, in many places, it was usual for parents, on the vigil of St. Nicholas, to convey, secretly, presents of various kinds to their little sons and daughters, who were taught to believe that they owed them to the kindness of St. Nicholas and his train, who, going up and down among the towns and villages, came in at the windows, though they were shut, and distributed them. The author of the "Popish Kingdom" makes the following allusion to this usage:—

"Saint Nicholas money used to give maidens secretly,
Who, that he still may use his wonted liberality,
The mothers all their children on the Eve do cause to fast;
And when they every one at night in senseless sleep are cast,
Both apples, nuts, and pears they bring, and other things beside,
As caps, and shoes, and petticoats, which secretly they hide,
And in the morning found, they say, that this Saint Nicholas
brought:—
Thus tender minds to worship saints and wicked things are
taught!"

"St. Nicholas," remarks Brady, "was venerated as the protector of virgins;" and there are, or were until lately, numerous fantastical customs observed in Italy and various parts of France, in reference to that peculiar

(1) Brady remarks upon *yule*, that it is a word "of which there seems nothing certain but that it means Christmas."

tutelar patronage. "In several convents," he adds, "it was customary, on the Eve of St. Nicholas, for the *boarders* to place each a silk stocking at the door of the apartment of the abbess, with a piece of paper inclosed, recommending themselves to '*Great St. Nicholas of her chamber*;' and the next day they were called together to witness the Saint's attention, who never failed to fill the stockings with sweetmeats, and other trifles of that kind, with which these credulous virgins made a general feast."

A correspondent in Hone's *Every Day Book* gives the following account of the curious customs (of which he was an eye-witness) connected with St. Nicholas' Eve, in Holland. "Imagine," he says, "a group of happy youngsters sporting around the domestic hearth, in all the buoyancy of riotous health and spirits, brim-full of joyous expectation, but yet, in an occasional pause, casting frequent glances towards the door, with a comical expression of impatience, mixed up with something like dread of the impending event. At last, a loud knock is heard; in an instant the games are suspended, and the door slowly unfolding, reveals to sight the venerated Saint himself, arrayed in his pontificals, with pastoral staff and jewelled mitre. Methinks I see him now! yet he did '*his spiriting gently*,' and his tone of reproof '*was more in sorrow than in anger*!' In fine, the family *peccadillos* being tenderly passed over, and the more favourable reports made the subject of due encomiums, good Father Nicholas gave his parting benediction, together with the promise, (never known to fail,) of more substantial benefits to be realized on the next auspicious morning! So ends the first act of the farce, which it will be readily anticipated is got up with the special connivance of papa and mama, by the assistance of some family friend, who is quite *au fait* to the domestic politics of the establishment. The concluding scene, however, is one of unalloyed pleasure to the delighted children, and is thus arranged:—Before retiring to rest, each member of the family deposits a *shoe* on a table in a particular room, which is *carefully* locked, and the next morning is opened in the presence of the assembled household; when, lo! by the mysterious agency (doubtless) of the munificent Saint, the board is found covered with *bon bons*, toys, and trinkets. It may not be deemed irrelevant to add, that, on the anniversary, the confectioners' shops display their daintiest inventions, and are gaily lighted up and ornamented for public exhibition, much in the same way as at Paris on the first day of the new year." All the above customs appear to have originated in imitation of a practice of St. Nicholas, who, it is related, used in the night time to throw purses in at the windows of poor maidens, for their marriage portions.

THE TRUE HISTORY OF THE ROUND TABLE AT WINCHESTER.

CONSPICUOUSLY upon the interior eastern wall of the County Hall, at Winchester, hangs the celebrated Painted Table of King Arthur, the true history of which has long been a *quæstio vexata* with antiquaries. However, last year, when the Archaeological Institute met in the time-honoured city of Winchester, one of the leading members of that Association read a very interesting inquiry into this very popular object of antiquity. This paper, from the pen of Mr. Edward Smirke, has

been printed in the Proceedings of the Institute, lately published; and our purpose is to present to the reader Mr. Smirke's ingenious conjectures and conclusions, divested of certain minute and literal evidence, the omission of which will not affect a reply to the popular question—"What is King Arthur's Round Table?"

It appears that, in 1788, Dr. Milner published in the *Gentleman's Magazine* some papers on the antiquities of Winchester, containing a statement that the celebrated Round Table was shown to Charles V. at Winchester, in 1522, when it was for the last time newly painted; and that it had been reported to be the genuine table of Arthur as early as the twelfth century, having been seen by John Lesley, Bishop of Ross, in 1137.

Subsequently, Dr. Milner corrected this statement by altering the date of 1137 to 1539; also by adding, that the Table was for the first time painted on the occasion of the Emperor's visit, and that the present one was probably the work of King Stephen. Mr. Smirke correctively adds that the Bishop assigns no date to his visit, but merely informs us that he had seen the Table "not long before" he wrote his book, which is dated 1578. The passage shows that the names of Arthur's knights were then inscribed on the circumference of the Table.

Mr. Smirke is not aware of any distinct reference to this Table before the reign of Henry VI. or Edward IV., when the poetic historian, Hardyng, who lived in both reigns, alludes to the Table of Arthur as "hanging yet" at Winchester; but it is somewhat unfortunate for the history of the table that the verse which mentions it is not to be found in the earliest manuscript copy of Hardyng. Giovinio, usually called Paulus Jovius, in a passage referred to in Warton's Description of Winchester, informs us that the Table was shown to Charles V. on his then recent visit to Winchester; but that the marginal names, having been corroded by decay, had been restored unskillfully, and with so little respect for the venerable antiquity of the original work, as almost to impair its character of genuineness. Jovius is, for various reasons, not likely to have been himself at Winchester during the visit of the Emperor in 1522, yet his account is probably correct; for the Table had certainly been repaired not long before that year; as we learn from the entry in the foreign accounts of Henry VIII., of 66*l.* 16*s.* 11*d.* for the repair of the "*aula regis infra castrum de Wynchestre et le Round Tabyll ibidem.*"

A Spanish writer, who was present at the marriage of Philip and Mary, is the first Mr. Smirke knows of who describes, or intends to describe, with some minuteness, the painting on this Table; the author is Diego de Vero, and the passage, in a MS. in the Royal Library at Madrid, is as follows: "*Lors du mariage de Philip II. avec la reine Marie, on montrait encore à Hunscriit la table ronde fabriquée par Merlin: elle se composait de 25 compartemens teints en blanc, et en vert, lesquels se terminaient en pointe au milieu, et allaient s'élargissant, jusqu'à la circonférence, appelé place de Judas, ou siège périlleux, restait toujours vide.*" The description is certainly not quite accurate, unless the painting has been altered since; and the name of *Hunscriit* is a greater departure from the orthography of the word *Winchester* or *Hamshire*, than is usually permitted even to a foreign writer. Yet, when it is recollected that the occasion on which the writer saw it was an event which certainly took place in Winchester, can it be doubted that he spoke of this Hall and Table?

To what period the identical names now on it are to be referred, Mr. Smirke leaves those to decide whose critical acquaintance with the cycle of the Round Table Romances will enable them to state the source from which the names are borrowed. But there is no doubt that, whatever retouching it may have undergone, (especially in the royal figure, which Mr. Smirke believes to have been repainted within the time of living memory,) the form of the letters, and general decorations of the Table, even if we had no extrinsic evidence, would indicate a date not later, nor much

earlier, than, the reign of Henry VIII. It was then that the black letter, approaching the time of its disappearance from inscriptions and architectural legends, began to grow fanciful and extravagant in its forms.

We may here interpolate, that the Table consists of a circle, divided into twenty-five green and white compartments, radiating from the centre, which is a large double rose. In the middle of the upper half of the circle, resting upon the rose, and extending to the double edge, is a canopied niche, in which is painted a rogal figure, bearing the orb and sword, and wearing the royal crown: this is reputed to represent King Arthur; and the modern reparations in the rose and the crown have been attempts, with more or less success, to adhere to the original design. Around the centre rose is a circle inscribed with black letter, except where it is broken by the base of the niche and the sitting king. There are also names inscribed on six of the white compartments, as well as in the circle around the compartments, of which, however, this circle is rather a continuation, in colour and form corresponding to the several divisions, each bearing a name. Aubrey, by the way, reports that, in his time, the name of Sir Gawain was in the "limbe" of the Round Table in the "Castle Hall."

Ashmole, in his History of the Order of the Garter, published shortly after the Restoration, speaks of the Table as having "no show of antiquity," and as having been "broken to pieces (being before half ruined through age) by the Parliament's soldiers in the beginning of the late war."

If Ashmole's account be literally true, the identity of the Table is in danger, and we must assign a very late date both to the fabric and the superficial embellishment; but it would seem that he spoke carelessly, and from report only.

Still, whatever be the date of this identical Table and its paintings, there is reason to think that, if it be not substantially one transmitted to us from the first renovation of the Hall by Henry III. it is, at all events, a Table of ancient lineage, the surviving representative of a very venerable work of art which once occupied its place.

Mr. Smirke adds, that, having met with the entry in the Chancellor's roll, 20 Henry III. of the "*Rota Fortunæ*," which had then been painted in the gable of the Hall at Winchester, towards the east, he was strongly impressed with the opinion that this wheel of fortune was the predecessor of Arthur's Table; and when he found among the Liberati rolls of the same reign, in the Tower of London, a commission by the king to paint a "*mappa mundi*" in the same Hall, it occurred to Mr. Smirke that an order to delineate a chart of the world had been figuratively executed by painting an emblem of its vicissitudes.

The pagan goddess was, indeed, a favourite with our Christian ancestors, and familiar to them long before this Hall was built; and the form has been correctly described as "a large wheel, with a crowned female in the centre, some rising, others falling from it." There are also various examples of it in churches, both at home and abroad.

The conversion of such a wheel into the subject now painted on the Round Table, was obvious and easy: Fortune, by a revolution of her own wheel, might have been deposed, and Arthur made to reign in her stead.

Unfortunately for this theory, Mr. Smirke found, on examination, that the order to paint the map of the world was issued three years, at least, after the Wheel of Fortune had been painted. It is, therefore, clear that, though this wheel may have been the foundation of the present picture, it could not have been painted in pursuance of the order to execute a "*mappa mundi*."

In what form, then, was this second order complied with? and where is the "*mappa mundi*" to be found? A recent publication of the Camden Society appears, at first sight, to supply an answer to these questions.

In the Thornton romance of Sir Degrevant, we are told that, in consequence of his valour and merit, he was made by King Arthur a Knight of the Round Table; and the poet vouches the "*mappa mundi*" in proof of the fact:—

"For thy they name hear that stounde
A knight of tabulle round,
As maked is the mappe mound
In storye full ryght."

The Editor of the romance is inclined to consider the allusion here to the "*mappe mound*" as "altogether fanciful;" and it certainly is extremely obscure, unless the expression has a much wider import than that of a geographical chart or map, in the usual sense of the word. The Editor, however, has himself noticed an example of its use in the larger sense of a written description of the "*miracula mundi*." It is, indeed, impossible to suppose that a *tabula rotunda* is synonymous with a *mappa mundi*; yet, among the "*miracula*," or memorabilia "*mundi*," suitable to the embellishment of a princely hall of the thirteenth century, our ancestors would, doubtless, have given place to Arthur and his knights.

A great and undefined antiquity is now generally allowed to the romances of the Round Table. They were, at all events, current in the Norman-French of Chrestien de Troyes, Manessier, and others, at the close of the twelfth century; and from Warton we learn that Henry was conversant with the romantic fictions of the age. Is it, therefore, unreasonable to suppose that, in pursuance of the king's order, Elias of Burham selected from the memorable things, of which the stories were then current and popular, the subject of a fabulous institution intimately associated by tradition with the castle of Winchester? If such was the fact, it was no unwarrantable deception, but a pleasant conceit, to delineate his subject on a circular board, purporting to be the very Table at which the king and his paladins were wont to sit.

Mr. Smirke, however, in the purity of antiquarian conscience, questions the admissibility of this tempting hypothesis. The *mappa-mound* of the Thornton romance-writer he believes to have been an historical and descriptive work, or "*storye*," such as Sir John Maundeville mentions in his *Travels*. The *mappa mundi* at Winchester was, probably, a geographical chart of the world, according to the notions prevailing among the learned of those days. There is, indeed, reason to believe that it was a familiar domestic ornament. Waltham abbey is known to have possessed one; there still exists one belonging to Hereford Cathedral; and, what is more in point, there was a *mappa mundi* of some celebrity at the royal palace at Westminster in the fourteenth century. The map varied in its shape; but, when it represented the entire globe, it was circular.

It ought not, therefore, to surprise us to find a chart of this kind in the hall of Winchester castle; and it is a curious confirmation of this view, that a manuscript, formerly belonging to St. Alban's abbey, of a date not very different from that of the hall itself, contains, among other circular diagrams or "*schemes*," representing various cosmographical theories, one which purports to be after the design of the architect of this very hall—"*Secundum magistrum Elya de Derham*."

The *mappa* at Hereford, being intended for an altar-piece, represents the day of judgment on its margin. That of Winchester may, possibly, have contained some marginal illustration, of which the subject was Arthur and his knights. In place of this, Mr. Smirke suspects the Table to have been substituted upon the occasion of subsequent repairs. Thus, the "*pictures*" of the hall were repainted in 44 Henry III.; and, in 1285, Edward I. celebrated the creation of many Knights at Winchester, when we observe that extensive repairs were executed.

Still, Mr. Smirke leaves the determination of the precise date to those whose curiosity and leisure may induce them to search for decisive evidence among the records of the Exchequer.

In the mean time, Mr. Smirke concludes, we must be content to assign to this curious work of art a respectable, but moderate, antiquity. With some allowance for repainting and reparation, it is, at all events, impossible to deny it an age of about four centuries:—it is possible that it may be extended to as many as six;—but, the chances in the present state of the evidence are in favour of some early, intermediate date.

By way of note, we may observe, that there is an old practice which may have originated in Arthur's Round Table. This is the "Round Robin," a circle, divided from the centre, like the famed Round Table; and in each compartment is a signature, so that the entire circle, when filled, exhibits a list without priority being given to either name.

Reading for the Young.

LOUISE, OR THE FAIRY WELL.

LOUISE ADELBERG was the only daughter of Carl Friedrich, a wood-cutter, who, with Gertrude his wife, dwelt in a hut, on the borders of the Schwarzwald, or Black Forest. Several families, who pursued their daily labour in the forest, were collected together, and formed a little colony, upon a spot which, though naked and barren in appearance, wore an air of sublime grandeur, such as the eye loves to dwell upon, after having feasted for some time on tracts more cultivated and verdant. It seemed as though, in this region, nature had succeeded in resisting the encroachments of man, and held her undisputed sway in one bleak and barren spot, amid all the changes that had been wrought on the face of the surrounding country, by the gradual development of civilized life. The foreground exhibited a rough broken surface, planted with oats, which sprang up in patches here and there, owing to the sterility of the soil. Behind, in the distance, dark pine-trees and firs frowned; and so thickly did these grow, that the forest was, in many parts, impervious to everything but sun and wind, which moaned in repeated gusts through the branches. In the centre stood about a dozen huts, each containing but two rooms; one was built of better material, and fenced round with stakes. This was the dwelling of the Aufseher, or Inspector of the District, to whom was delegated the office of arbitrator in all the domestic feuds of the little settlement; his duty also it was to keep an exact account of the timber cut, and to forward it in rafts down the Rhine, to its destination. These poor wood-cutters lived together a life of peace and harmony, which promised to be of lasting duration, from the habits of intimacy, founded upon good feeling, which existed among all the children of the colony. One of the men was left from day to day to guard the settlement, while the others worked in the forest; and the various children were allowed to mingle together, and to enjoy their favourite sports, under the control of this daily guardian.

Louise was naturally of a thoughtful turn of mind, which had been fostered from her cradle by the legendary accounts of elves and fairy-spirits

with which the whole country abounded. There was not a chain of mountain, or a gloomy forest-shade, that was not associated in her memory with the spell of some superhuman power, its own peculiar inhabitant. She never entered into the frolics of her companions with the spirit that might have been expected from a blooming girl, who had not yet seen her tenth spring; and, if she joined in the sport, her mind was continually wandering from the game. "There! Louise has missed the ball again," was the constant cry of her young friends; "she is losing what little skill she once possessed." Such speeches Louise bore in good part, but still she never tried to conquer her feelings, so that the ball which fell at the beginning of the game, was rarely found in her hand once ere the sport was over. If she could steal away unperceived from the little band, she would choose out some spot from which she could gaze undisturbed upon the dark forest, and lose herself in wonder as to the spirits who made it their abode; for their absence from so congenial a home was to her incredible. She further believed that the agency of all spirits was exerted for the benefit of mankind, and that all instances, in which their operation had proved injurious to their visitants, were but the punishments inflicted upon man for some signal and heinous crime. With these sentiments, she never feared to enter the forest at nightfall, though her companions would often endeavour to dissuade her from her rambles. She would sometimes even quit the beaten track, and make her way through the briars till she met with another path, though the children were never allowed to wander far from the huts, for fear they should not discover the route back. During her forest rambles, Louise would occasionally allow her thoughts to flow forth in words of invocation. She would seat herself on a mossy bank, and, repeating from memory the spells which she had learned of old, summon the spirits from their forest-lair. The wind came whistling through the branches; deeper and deeper still it sounded; could it be the voice of the wald-genie—the forest-king, riding over the pine-tops? The wind fell, and a calm stillness succeeded; in the silence of the scene around her, she heard a faint whisper, and rose from her seat, and by her side stood her little brother, calling her by name.

"Louise," cried the child, twining his little arms round her neck, "you never stay to play with us now, but forget your brother, who loves none so dearly as you; why should you leave us, to sit in the dark forest? You are sad and silent, dear Louise; you must rest in the hut to-morrow, and I will stay and amuse you; and you will love me again, wont you, Louise?" said the child, raising his pretty blue eyes, till they met those of his sister. Louise kissed the little fellow tenderly, and they left the forest, hand in hand. A merry shout greeted them as they emerged from the wood into the open space, and Louise, yielding to the affectionate entreaties of her brother, accosted all the little ones warmly, and, for the first time, evinced a degree of spirit and animation in entering into the sport.

The evening meal of warm milk and oaten cake was prepared, and the family were seated round a log fire, which blazed cheerily, and lighted the hut—

"Louise, my child," said the wood-cutter, "you have been in the Schwarzwald to-day, but never

again leave the beaten track, or you will be lost in some of its dark recesses."

"She is going to stay in the hut with me, to-morrow," said her little brother; "I am going to amuse her."

The children then retired into the inner chamber for the night, and soon slept in each other's arms. Louise was speedily wrapped in pleasant dreams, the visionary creations of her wakeful hours. She seemed to have become suddenly dead to all the feelings of mortality, and to have entered into a new existence of exquisite bliss, clouded by no shade of misery, calm and serene as the state of the happy departed. She felt a degree of buoyancy of spirit which she had never known before; and the sense of the beautiful seemed to steal insensibly over her frame, and was heightened by the winning graces of the scene in which she moved and breathed. The dark forest was exchanged for a bright unbounded space of flower-garden; the dark pines were lost in the foliage of mighty cedar-trees, and delicate willows, overhanging a bubbling stream of crystal water. There were no huts to be seen, but in the centre stood a circular edifice of shell-work, presenting a green exterior, from the moss with which it was covered, relieved by the more lively tints of wild-flowers that clung to it. Bees, of an unusual size, whose downy bodies were tinged with all the rainbow hues, hovered over the flower-beds; birds, of the most delicate form, hopped from spray to spray, making sweet music from their quivering throats: and, as the breeze kissed the opening rose, and gracefully bent the lily bell, their perfumes, mingled with the treasures of a thousand odoriferous shrubs, steeped the senses of the little slumberer in new delight. Several airy forms flitted about the garden, concealed beneath light blue silk draperies, gathered in at the waist by a delicate circlet of white coral; a silver band was fastened round their brow, set in the centre of the forehead with a precious stone, either a diamond, ruby, emerald, or sapphire.

The sleeping child gazed silently around her, and heard a voice sweet and soft as a silver-tongued bell, saying—

"Come hither, child of mortality! here is balm for the wounded spirit; here is rest from the strife and turmoil of the world. Come hither, maiden! the plague-spot of sin hath not marred thy brow; come hither, pure and spotless as thou art, ere the chilling breeze, or the noxious blight, taint thee. Here is a well of water to revive the lustre of the sunken eye, and the bloom of the faded cheek; here is a stream to wash away the stain of earth, and to render thee a creature of undying beauty. Here the fierce passions that wage unceasing war in the mind of gross mortality dare not enter; here jealousy, hatred, and revenge are lost in one stream of boundless love, that binds the holy of earth with the sainted of heaven." "I come, beautiful spirits!" murmured Louise from her half-closed lips, and in a few moments the morning sun that darted through the window, roused her from her dream. She rose and dressed her little brother, and the two children entered their parents' chamber hand in hand, where the woodcutter was preparing for his morning labour. The children sat down to their repast of milk and cake, and Louise said to her father as he was leaving the hut, "Father dear, I shall bring your dinner into the forest at noon, for I know where to find you by the trees that were felled yesterday."

"No, rest thee to-day, my darling," said her father, kissing her forehead, "your mother will attend to me." "Yes, and I will attend to Louise," said her little brother, taking her hand, "and we shall be so happy here to-day, without going into that gloomy forest." "May that love of yours continue, my children," said the woodcutter, as he shouldered his axe and went forth to work. The children listened to the sound of his footsteps as he tracked the nearest forest-path; soon his morning song burst merrily forth—

"How happy is the woodman's lot!
In the wild and tangled wood,
Where the broad green boughs give a shady cot,
And a gleaming axe his food!
Then fall beneath his sturdy stroke
The plant ash and the mighty oak.

His axe rings well in the merry wood,
At the early prep of day,
In the spot where the monarch oak hath stood
For ages past away;
And when the shades of eve steal o'er,
The sound of his axe is heard no more.

When death shall fell the parent tree,
The younger shoot shall stand;
In the forest-depths his grave shall be,
When stiff the woodman's hand.
And the axe of the son shall be heard once more,
In the wood where his sires have worked before."

"Aye, that it shall," exclaimed the little fellow, as he caught the last few words of the song, "it shall work for Louise, and hard too."

When the bright sunshine called forth the children from the various huts to enjoy their usual sports, there was a general cry of "Where is Louise and little Carl;" and many of the young ones dispersed themselves, and went in search of the truants. They sought her in her usual haunts, but to no purpose; and they were just giving over the pursuit as useless, when Carl's little rosy face was seen peering out of the door of the hut. "Come, Carl, we wait for you and Louise, to make some new game for us, for we are all tired of our old sports," said a little neighbour.

"We cannot play with you to-day," said Carl, "for we shall not leave the hut, and I am going to nurse Louise."

The news of their intended absence soon spread among the children, and Carl returned to his sister, and endeavoured to amuse her by the recital of the last legend which their father had told him; but, though he ran on from the denizens of air to the spirits of flood and fire, and told how elves and genii had mingled with mankind in curious guises, and the good effects they had wrought by their mystic spells,—though he painted in vivid colours the appearance of the wald-genie himself, a theme of general interest to the mind of childhood, she paid but little attention to his innocent prattle. She was fully absorbed in a day-dream of beauty, the reflection as it were of the night's vision. The gems that decked the brows of her fairy visitors were still glittering before her eyes, and the echo of the words so lately addressed to her had not died away. The day seemed to her too lengthened, she longed eagerly for the approach of night; and, when the deepening shadows told of its approach, she wished for sunrise, that she might again enjoy a ramble in the forest. Day dawned upon her once more, and at noon she tripped out of the hut towards the forest, taking with her a basket containing her father's dinner. She threaded her accustomed path, occupied in mind with her fanciful vision, and observed, for the first time, some

large flowers growing on a mossy bank. Their shape was so delicate, and their colours so inviting, that she stayed her pace to admire them sufficiently. "Surely it would not delay me long to gather a few, they will make our little chamber quite charming." Such were her thoughts: but the little voice within her would be heard, and urged her to hasten to her father. "Only let me gather one," said she, "and then I will redouble my pace;" but it knew of no course but the direct path, and would suffer no deviation from it. "On, on," it seemed to say, and her heart throbbed wildly within her. She stood for a moment more in suspense, wavering between her desire and her duty, but the claims of the latter proved impotent, and she laid her basket down and began to pluck the flowers. When she had gathered a few, she saw at a little distance some of superior size and brilliancy. She darted off in the direction, and at the moment she was breaking the tiny stalk, a large bee issued from the flower, and hovered about her, telling by his buzzing voice of the spoil he had found. "Oh, what a lovely creature!" thought Louise, "exactly like those I saw in my dream; I must try and catch it, to show little Carl." With these words she let fall the flowers out of her apron, and ran after the bee, endeavouring every moment to envelope it in its folds. Onward flew the bee, no longer staying to sip the sweets in his path; behind ran the panting child, laughing at her vain attempts to get him into her power, till, from her eagerness and her fear of losing the prize, she forgot the cause of her visit to the forest, and the request of her parents not to advance too far into its depths. The bee alighted at length upon a wallflower, which sprang from the crevices of some old brick-work before her. "One effort more, and I shall have it," said Louise, as she hastened to throw her apron over the flower; but the bee had flown, and Louise found herself at the brink of what had apparently been an old well, though its ruinous condition seemed to indicate that a long period had elapsed since it had been visited for its water. The edge was covered with grasses and moss; part of the rope was still remaining: but the bucket to which it had been attached was missing. Louise knew not to what part of the forest she had wandered. The well was a novelty to her; and, to increase her dismay, her eye failed in discovering the path by which she had reached it. Then the still small voice of conscience began to blame her for gathering the flowers. She upbraided herself for her folly, and burst into a flood of tears. She was naturally an affectionate child, so that the idea of being parted from all who were dear to her was painful in the extreme; the despair of her father was presented to her eyes, the mute anguish of her mother, when she returned not from the forest, and the sorrowful tone in which little Carl asked, "Where is my sister? Where is dear Louise?" fell heavily upon her ear. Then she attempted to find a pathway, but brambles and briars stayed her progress on all sides; twilight came on—one star burst forth—soon a faint streak of light assured her of the presence of the moon; a chill air blew upon her; yes, night was indeed drawing on apace, and she in the forest, without light and without shelter! She threw herself down upon the brink of the well, and, as the moonbeams fell upon it, she descried, several feet below her, the clear glassy surface of the water. While gazing intently upon the clear crystal, her

imagination traced out for itself beautiful pinnacles and towers in the water; two bright beings, such as she had seen in her dream, seemed to stand as wardens upon the summit, and she heard the same silver tones she knew so well, singing

"When the chaste moon-beams
O'er the waters play,
Our guard we keep,
And watch and pray;

Watch that the foe may ne'er alarm thee;
That sin and sorrow ne'er may harm thee;
Pray that thy voice be rais'd to bless,
Thy bosom glow with holiness.
Strive, oh, strive, and thou shalt be
A child of spotless purity,
A beacon bright, 'mid sin and woe,
'Mid the last wreck of bliss below."

As the last words swelled louder forth, Louise sank into a gentle slumber. She lost in her repose all remembrance of her folly, and felt a more pleasant sensation of calm security than she had ever experienced in her former dreams. She seemed to have been lightened of her load of mortality, to be dead to all other feelings but those of unbounded bliss. Her sleep was unbroken during a long series of hours, but at times she murmured forth, "I come, beautiful spirits! I come." She was awakened by a sense of some most delicious odours, delicate as the perfumed treasures of the most choice flower-bells. She opened her eyes, and in a transport of bliss exclaimed, "My wishes are at last crowned, I have come to join you, beautiful spirits! and, oh, what a life of joy it must be, to roam free and fearlessly amid such scenes as this!" She found herself upon a couch of ebony, inlaid with silver, but of such light structure and tiny dimensions, that it seemed hardly strong enough to support her frame. The linen in which she was wrapped was of the finest texture, and the coverlet of dark purple velvet with a broad fringe of gold. The hangings were of a pale primrose tint, which contrasted well with the darker shades which the carpet wore, which consisted of the furs of various animals wrought into various patterns; it appeared almost too delicate for the foot, and Louise thought it a luxury to walk upon it. There was a mirror of burnished silver, encased in a framework of tortoise-shell, projecting from the wall, so as to allow her a sight of her whole form. In the centre of the chamber stood a vase of crystal, upon a pedestal of frosted silver, and the wreathed columns that issued from it were of a most delicious perfume. As Louise had been accustomed from her infancy to paint in her own mind the beautiful dwellings of the spirits, and to feast on her creations with all the ardour with which the young heart clings to its dearest treasure, she did not exhibit any feeling of awe, which might have been expected from her realizing for the first time her visions on earth. Still she wandered on from object to object, and explored the whole chamber with a gay spirit that only longed to know more of so charming a habitation. One circumstance, certainly, puzzled her for some moments—the loss of her clothes. Her blue woollen frock, with its snow-white boddice, was missing; her little straw hat had disappeared too. This made her uneasy for a short time, but she soon dismissed the subject altogether from her mind, with this reflection, "If there be so beautiful a chamber and so richly furnished as this, it will not be a hard matter to find a simple frock."

"Not for such as thee," replied a soft voice near her. Louise turned round instantly, but there was

no one in the chamber; but on the couch was laid a delicate white robe, ready for use, with a circlet of oak leaves twined with acorns for her hair. She immediately put on the robe, and, binding her hair off her forehead with the green chaplet, stood before the crystal mirror surveying her figure in her new and delicate costume. The sight charmed her amazingly, and the flush of health and beauty mantled in her cheek as she exclaimed, "Oh, that my father and mother could see me now! how little Carl would wonder at me, and love me too!" She then felt a strong desire to explore the fairy regions, and to see whether there were other fairer scenes than that around her. She passed out by a curious archway of stone-work, upon which the chisels of the sculptor had been employed so successfully, that the most minute flowers, with their tiny petals and fibred foliage, were executed with a degree of nicety almost incredible. Each flower bore its own natural colour, and the beautiful effect was considerably heightened by the judicious taste which had grouped them together. There were three scrolls over the archway, bearing in antique characters the following inscriptions:—

On the right:—

Life is but a trial at most.

On the left:—

Happy they who use it well.

And in the centre:—

Fear not, and thou shalt win.

(To be concluded in our next.)

THE ECCENTRIC NATURALIST.

"WHAT an odd-looking fellow!" said I to myself, as, while walking by the river, I observed a man landing from a boat, with what I thought a bundle of dried clover on his back. "How the boatmen stare at him! Sure he must be an original." He ascended with a rapid step, and, approaching me, asked if I could point out the house in which Mr. Audubon resided. "Why, I am the man," said I, "and will gladly lead you to my dwelling."

The traveller rubbed his hands together with delight, and, drawing a letter from his pocket, handed it to me without any remark. I broke the seal, and read as follows: "My dear Audubon, I send you an odd fish, which you may prove to be undescribed, and hope you will do so in your next letter. Believe me always your friend, B."

With all the simplicity of a back-woodsman I asked the bearer where the odd fish was, when M. de T. (for, kind reader, the individual in my presence was none else than that renowned naturalist) smiled, rubbed his hands, and, with the greatest good humour, said, "I am that odd fish, I presume, Mr. Audubon." I felt confounded, and blushed, but contrived to stammer out an apology.

We soon reached the house, when I presented my learned guest to my family, and was ordering a servant to go to the boat for M. de T.'s luggage, when he told me he had none but what he brought on his back. He then loosened the pack of weeds which had first drawn my attention. The ladies were a little surprised, but I checked their critical glances; for the moment the naturalist pulled off his shoes, and while engaged in drawing his stockings, not up, but down, in order to cover the holes about the heels, told us, in the gayest mood imaginable, that he had walked a great distance,

and had only taken a passage on board the *ark* to be put on this shore, and that he was sorry his apparel had suffered so much from his late journey. Clean clothes were offered, but he would not accept them; and it was with evident reluctance that he performed the lavations usual on such occasions, before he sat down to dinner.

At table, however, his agreeable conversation made us all forget his singular appearance; and, indeed, it was only as we strolled in the garden that his attire struck me as exceedingly remarkable: a long loose coat of yellow nankeen, much the worse of the many rubs it had got in its time, and stained all over with the juice of plants, hung loosely about him, like a sack; a waistcoat of the same, with enormous pockets, and buttoned up to the chin, reached below over a pair of tight pantaloons, the lower parts of which were buttoned down to the ankle; his beard was as long as I have known my own to be during some of my peregrinations, and his lank black hair hung loosely over his shoulders; his forehead was so broad and prominent, that any tyro in phrenology would instantly have pronounced it the residence of a mind of strong powers; his word impressed an assurance of rigid truth, and, as he directed the conversation to the study of the natural sciences, I listened to him with as much delight as Telemachus could have listened to Mentor. He had come to visit me, he said, expressly for the purpose of seeing my drawings, having been told that my representations of birds were accompanied with those of shrubs and plants, and he was desirous of knowing whether I might chance to have in my collection any with which he was unacquainted. I observed some degree of impatience in his request to be allowed to see what I had. We returned to the house, when I opened my portfolios, and laid them before him.

He chanced to turn over the drawing of a plant quite new to him. After inspecting it closely he shook his head, and told me no such plant existed in nature; for, kind reader, M. de T., although a highly scientific man, was suspicious to a fault, and believed such plants only to exist as he had himself seen, or such as, having been discovered of old, had, according to Father Malbranche's expression, acquired a "venerable beard." I told my guest that the plant was common in the immediate neighbourhood, and that I should show it him on the morrow. "And why to-morrow, Mr. Audubon? let us go now." We did so; and on reaching the bank of the river, I pointed to the plant. M. de T. I thought had gone mad: he plucked the plants one after another, danced, hugged me in his arms, and exultingly told me that he had got not merely a new species, but a new genus. When we returned home the naturalist opened the bundle which he had brought on his back, and took out a journal, rendered waterproof by a leather case, together with a small parcel of linen, examined the new plant, and wrote its description. The examination of my drawings then went on. You would be pleased, kind reader, with his criticisms, which were of the greatest advantage to me, for, being well acquainted with books, as well as with nature, he was well fitted to give me advice. It was summer, and the heat was so great that the windows were all open. The light of the candles attracted many insects, among which was observed a large species of scarabæus. I caught one, and, aware of his inclination to believe only what he should himself see, I showed him the insect, and assured him it was so strong, that it could crawl on the table with the candlestick on its back. "I should like to see the experiment made, Mr. Audubon," he replied. It was accordingly made, and the insect moved about, dragging its burden, so as to make the candlestick change its position, as if by magic, until coming to the edge of the table, it dropped upon the floor, to wit, to wing, and made its escape.

When it waxed late I showed him to the apartment intended for him during his stay, and endeavoured to render him comfortable, leaving him writing materials

(1) From Audubon's Ornithological Biography.

in abundance. I was indeed heartily glad to have a naturalist under my roof. We had all retired to rest: every person, I imagined, in deep slumber save myself, when, of a sudden, I heard a great uproar in the naturalist's room. I got up, reached the place in a few moments, and opened the door, when, to my astonishment, I saw my guest running about the room naked, holding the handle of my favourite violin, the body of which he had battered to pieces against the walls, in attempting to kill the bats which had entered by the open window, probably attracted by the insects flying around his candle. I stood amazed, but he continued jumping, and running round and round, until he was fairly exhausted, when he begged me to procure one of the animals for him, as he felt convinced they belonged to "a new species." Although I was convinced of the contrary, I took up the bow of my demolished cremona, and administering a smart tap to each of the bats, as it came up, soon got specimens enough. The war ended, I again bade him good night, but could not help observing the state of the room: it was strewn with plants, which it would seem he had arranged into groups, but which were now scattered about in confusion. "Never mind, Mr. Audubon," quoth the eccentric naturalist, "never mind, I'll soon arrange them again. I have the bats; and that's enough!"

Several days passed, during which we followed our several occupations: M. de T. searched the woods for plants, and I for birds. He also followed the margin of the Ohio, and picked up many shells, which he greatly extolled. With us, I told him, they were gathered into heaps, to be converted into lime. "Lime! Mr. Audubon, why they are worth a guinea a-piece in any part of Europe." M. de T. remained with us for three weeks, and collected multitudes of plants, shells, bats, and fishes. We were perfectly reconciled to his oddities; and finding him a most agreeable and intelligent companion, hoped that his sojourn might be of long duration. But, one evening when tea was prepared, and we expected him to join the family, he was nowhere to be found. His grasses, and other valuables, were all removed from his room. The night was spent in searching for him in the neighbourhood. No eccentric naturalist could be discovered. Whether he had perished in a swamp, or had been devoured by a bear or a garfish, or had taken to his heels, were matters of conjecture; nor was it until some weeks after, that a letter from him, thanking us for our attention, assured me of his safety.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title, in Selections, it is printed in Italics at the end.]

THE LITTLE BELL.

FROM THE GERMAN OF SCHÜD.

THE King is on his death-bed, he bids them call his son,
He grasps the stripling by the hand, and, pointing to the throne,
"My son," he feebly faltered forth, "yon royal seat is thine,
Yet, ere thou donn'st thy father's crown, think on these words
of mine:

Fancy perchance hath pictured fair this vain weak world of ours,
Alas for Fancy's dreams! too soon thou'lt find how few its
flowers!

Howard drops it yields its bliss, in swollen streams its woe;
How scant drops 'mid thousand streams have been thy sire's
know."

He died and slept for aye—the youth his words hath heeded
not;

Fair as the rose which blooms in May deems he his lovely lot.

He mounts the throne, whilst scornful smiles athwart his features played,

"Now will I prove how sickly dreams my doting sire betrayed!"
High o'er the loftiest pinnacle that crowns his hall of power,
Where wasail, rest, or reverie disputes the passing hour,
A bell, a little bell he hangs, its brazen chimbs to breathe,
Each time it listeth him to touch the cord that sways beneath.
That will he sound, that thro' his realm the news may spread
abroad

How cankering care forsakes his couch, how blissful is its lord.
Fondly he deems no day shall pass, but, that that little bell,
Touched by his willing hand, the tale of cloudless bliss shall tell.
And brightly dawneth day by day, yet ere that day is o'er,
The hopes that morning ushered in, at sunset smile no more:
Oft towards the cord the princely youth his eager glance hath
flung,

Yet something stirs within his breast—the bell remains unring.
Now deems he his a well-proved friend, what gift with that can
vie?

"Sound forth, thou brazen herald thou, for who so blest as I?"
But an envoy stands before him—tears with his tidings blend—
"Basest than basest foe is he, whom thou hast called thy friend!"
Again a fond, fond dream is his! he deems *her* heart his own!
"Now let my bliss, my matchless bliss, to all the world be
known!"

But lo, his minister draws near, with face foreboding wo:
"Alas, my liege, and is it thine, nor truth, nor trust to know!"
Sorely his soul is chafed, yet hath he not his land,
With many a princely treasure there, and many a gallant band?
Fairer, I ween, no realm than his o'er pranked beneath the sun,
For God and man, to do it grace, their goodliest had done.
He hies him to the lattice, and he looked far and wide,
And his royal eye is flashing, and his bosom swells with pride.
Now will he joyous to the cord, now will he sound—but lo,
Within the hall are hurried steps—a messenger louts low:
"Sir King, see there, see there, yon flames that riseth high and
clear,

Our dwellings burn, our maidens flee, before the foeman's spear!"
"Ah, traitor slaves!" bursts forth the King, and stead of silken
cord,

He snatches up his trusty mail, and buckles on his sword.
Already care hath thinned his locks and dimmed his eagle eye,
Yet ever silent rests the bell, the little bell on high.
And should a transient gleam of bliss illumine his withered brow,
Scarce thinks he to awake its tones—it aways unnoticed now—
He feels his sands are fleeting fast—he lays him down to die;
When from without unceasingly he hears a wailing cry.

"What mean those sounds of sorrow, what means that note of
woe?"

"Ah, Sir, our father leaveth us—his children weep below!"
"My children, bid them enter!—lov'd they their lord so well?"
"Oh, Sir, could life but ransom life, their ready blood would
tell!"

But many a stout and sturdy heart is eager thronging in,
Once more to bless his dying lord,—once more to see his King—
"Ye lov'd me then, my children?" and thousands faltered
"Aye!"

The dying monarch caught the word—he raised himself on high,
And seized the cord—to Heaven one prayer his upturned eyes
addressed,

Then bade the bell peal loud and long, and, smiling, sunk to
rest.

STAMPED, 2½d.]

Seckford's Almshouses, Woodbridge, Suffolk.

Among the numerous charitable foundations existing throughout this part of the kingdom, those are generally the most wealthy and flourishing which have some connexion with the metropolis. The immense increase in the value of property within the ever-widening bounds of London, causes a bequest of land in that city, (however small that bequest may have originally been) to become a fruitful source of wealth to the institution with which it is connected. Thus, in 1567, the bequest of a few acres of pasture land, called the Conduit Close, half-a-mile from the city of London, and then yielding a rent of only ten pounds a year, was the means of raising to wealth and importance that well-known establishment, Rugby School. This Conduit Close (now Lamb's Conduit-street, and the streets adjoining) yields at the present time an income of many thousands per annum a fact that would have appeared utterly incredible to the original founder of the charity. Similar instances are common; among which, we may here particularly notice that of an endowment made in 1587, of a moderate estate in Clerkenwell, yielding at that time a yearly

rent of about one hundred and twelve pounds. This estate was generously devoted by its owner, Thomas Seckford, Esq., to the support of certain alms-houses built by him in the town of Woodbridge, a few miles from Ipswich, Suffolk, where his own property lay. The original alms-houses comprised seven tenements, with land adjoining, for the residence of thirteen poor men; six of the houses being fitted each for the residence of two pensioners, and the seventh for the remaining pensioner, who was to be called the Principal. Each inmate had a yearly supply of fuel and clothing, and a stipend of five pounds, except the Principal, who had six pounds thirteen shillings and fourpence yearly. The founder of this charity also gave another tenement, and two acres of land for the use of three poor widows, to be nurses to such of the poor men as should be sick and infirm, and to have each a yearly stipend of two pounds thirteen shillings and fourpence.

In the course of time, the Clerkenwell estate rose immensely in value, and the governors of the alms-houses improved the property in London, by taking

down many old buildings, and laying out new streets. The charity estate now comprises Seckford-street, Woodbridge-street, Suffolk-street, one side of St. John street, Aylesbury-street, St. James's-walk, Prison-walk, and Corporation-row, and the whole is said to yield a yearly rental of more than 4,000*l*. During the progress of all these improvements, the funds of the charity were expended in obtaining acts of Parliament for the contemplated changes, and in paying for their execution, so that in 1830, when the Commissioners of Charities inquired into the affairs of this institution, it appeared that no alterations had been made in the allowances to the alms-people, or other payments since 1768, when the rental of the estate was only 563*l*. per annum, but that it was the intention of the governors, as soon as the building ground was let, to apply for an act of parliament for the future regulation of the charity funds. The yearly sums paid out of the rents at that time, and for some years afterwards, were to the principal, 27*l*.; to each of the twelve almsmen, 20*l*.; to each of the three nurses, 12*l*.; to an extra nurse, 13*l*.; to the minister of Woodbridge, 10*l*.; to the churchwardens, 10*l*.; to the receiver of the rents, 12*l*.; to the poor of Woodbridge, in clothes and coals, about 152*l*.; to the parishes of Woodbridge and Clerkenwell, for distribution among the poor, each 10*l*.; with about 50*l*. for the repairs of the alms-houses, for medical attendance, &c.

In 1838, the governors of this charity were enabled to enlarge it altogether, by doubling the number of almsmen and women, who were to receive its benefits, and by building a new hospital befitting the increased wealth of the institution. This handsome edifice is in the Elizabethan style, and comprises two wings, with a chapel in the centre, and has two entrances, with massive bronze gates, and a porter's lodge. The whole was raised at the cost of fifteen thousand pounds, from a design by J. Noble, Esq. In this extensive hospital there is ample accommodation for the twenty-six almsmen and six nurses; each being provided with two rooms and a small garden. The almsmen have a yearly stipend of 25*l*., the Principal has 80*l*., and the nurses have each 20*l*. All are supplied with coals, clothing, and medical attendance. The Principal has the superintendence of the other inmates, under the direction of the minister and churchwardens of Woodbridge. Since the erection of this new building, the old alms-houses have been let at very low rents to poor widows.

The founder of this excellent charity lies interred in a private chapel adjoining the north side of the chancel of the parish church of St. Mary Woodbridge. He was one of the Masters of the Court of Requests, and Surveyor of the Court of Wards and Liveries in the reign of Elizabeth. His remains were deposited under a large altar-tomb in this chapel; but the brass inscriptions and ornaments, &c. were stripped from the tomb in 1643, by Dowsing, the parliamentary visitor. Seckford is said to have been distinguished in the polite accomplishments of the age in which he lived, as well as learned in the law. To his patronage of Christopher Saxton, the public was indebted for the first set of country maps, which were engraved at his expense. This benevolent individual died without issue in 1588, aged 72, having represented Ipswich in three parliaments, and earned to himself the character of a general benefactor to his own town of Woodbridge.

SOME THOUGHTS ON THE PRESENT CONDITION OF SOCIETY.

It does not usually fall within our province to notice newspaper articles: politics are not our vocation. But attention has recently been directed to some remarks on a matter altogether removed from political controversy, in a newspaper whose influence over the public mind on every subject which it touches is de-

servedly very great; which remarks, partly for their intrinsic interest, and partly on account of the train of thought which they have suggested to our own minds, we venture here to lay before our readers, deeming the subject sufficiently catholic in its character to involve in its treatment no violation of our rule of abstinence from controversial topics. Our remarks will, perhaps, not be very closely connected with the text on which we found them, but sufficiently so, we trust, to excuse us for placing them together.

The newspaper we refer to is *The Times*, which, in a late number, devotes a leading article to some observations upon a meeting of the Bradford Mechanics' Institute, at which that amiable and accomplished statesman, Lord Morpeth, attended, and delivered a very interesting address. We extract the most striking passages in the article:—

"Without giving our adherence to the creed of those who believe that Mechanics' Institutes are to be the means of redeeming the human race from ignorance and barbarism to knowledge and refinement, we must admit that, under certain conditions and certain management, they may be productive of real good. But they require this certain management—they ought to be governed by these certain conditions—to prevent them from being perverted into ridiculous, if not pernicious, exhibitions. There is, perhaps, no temptation more alluring to the indulgence of froward self-conceit or impertinent garrulity, than that which is presented to a fluent but ill-informed speaker by the opportunity of addressing a worse-informed and illiterate audience. In such a case, vanity fans the flame of presumptuous sciolism, and the follies or prejudices of the many are fostered by the self-complacency of one. The flippant speaker and the heedless audience react upon one another to propagate and promote erroneous opinions, or inaccurate conjectures, which are more dangerous than utter ignorance. But the case is far different when the teacher is able, erudite, and impartial—the audience docile, confiding, and unprejudiced. And there are few more graceful kinds of intellectual condescension, than that which is manifested by a man of cultivated taste, who courts the opportunity of instructing the uneducated, refining the unpolished, and correcting the prejudices of the half-learned, amongst his less fortunate neighbours. Nor will such an effort, in itself generous and kind, be maimed of its strength or deprived of its reward, if he who makes it add to the natural gifts of talent and of taste the artificial advantages of birth and rank. Those who detest toadying, and despise 'flunkeyism,' will yet reserve a proper admiration for him who makes rank and birth instruments for raising noble aspirations, and encouraging exalted pursuits. And even those who profess a political detestation of all class distinctions will become reconciled to them in the person of one who not only does not disclaim, but proudly avows, his connexion with and devotion to the humanities of science, of literature, and of art.

"Associations of this kind have become among the facts of the day. They exist, and they will continue to exist. The tone which they take, the spirit by which they are guided, the maxims which they evolve, pass into other assemblies, and animate other associations. They are only one form of that federal propensity which is amongst the characteristics of our time. The advantage, then—nay, the necessity and the duty—of giving them certain tendencies, of infusing into them certain principles, must be too obvious to require any lengthy inculcation. When we recollect the facility with which men are now-a-days leagued together for purposes either social or political—either of good or evil—it is not unimportant that in the minds of the masses the idea of combination should be associated with the example of at least one society where good order is observed, sound

knowledge imparted, and party prejudices repudiated. As Lord Morpeth said, 'It is most salutary to have some common neutral ground, where all can equally at times meet together without any restraint, save that of mutual self-respect.' * * * * *

If they merely bring together persons of different stations and occupations—if they lead the man of rank, the student, and the philosopher, into the haunts of busy industry—they will have done much to consolidate the various elements of our system, and to destroy the too frequent, but not inevitable, causes of repugnance and antagonism. And when once the ice is broken, literature, or science, or music, or amusement, will, at least, have the opportunity of proving their legitimate influences. We can easily understand the Eton aspirations of Lord Morpeth, when he looks forward to the time that some scholar will introduce to the knowledge of the Bradford mechanics 'the blind old bard of Scio's rocky isle.' Without, however, anticipating that period—perhaps not a distant one—we may profess ourselves content with hearing the 'bard of all time,' and 'the minstrel of the North' well read and well criticised in an assembly of men who live by the labour of their hands. A multitude which can applaud Shakspeare, and appreciate Scott, must cherish feelings of kindness and humanity far higher and stronger than the passions of party, or the jealousies of caste. A peer or a doctor of laws expounding the philosophy of Hamlet and the pathos of 'Midlothian' to a congregation of mechanics, would present a study worthy of remark alike to the admirers and the assailants of our social system.

* * * * *

"We will not pass over Lord Morpeth's advice, that those amongst the busy folks of a busy town who have the opportunity should study the history and constitution of their native land. This advice applies to men higher in the social scale than the simple artisan. How many men are there, well to do and living at ease, who know literally nothing of their country's history! It was a remark of Coleridge, that the Reform Bill would give influence—not individual votes, but the command of votes—to the most ignorant portion of the community. Master builders, owners of small houses, public-house keepers, &c. used generally, a few years ago, to harangue their operatives and tenants with a violence which could only be exceeded by their ignorance. And this mischief passed from words to actions. Perhaps the inhabitants of no other country in the civilized world are so utterly ignorant of their own history and institutions as Englishmen. Foreigners generally remark this. It applies even to professional men and fellows of colleges, but more particularly to the lower part of the trading body. From men of this class come the gross and ridiculous misstatements, the perverse notions, and the shameless lies, which, in times of political excitement, sway the feelings of our mobs. And it is from such men as these—men of uncertain fortunes and unfixed principles—that that very noisy faction, the Anti-Anglican party in America, is continually recruited. It is by men who hate their country, because they are unworthy of it; who libel its institutions, because they know nothing of them; and misinterpret its history, because they never learned it—it is by these that England is dishonoured and calumniated to the world. And so long as our different ranks of society remain apart—so long as there is no common pursuit to bring them together; no common study to humanize their sympathies and harmonize their affections—so long will this be so;—so long must England continue to be a nation of castes, classes, and factions, instead of an empire bold in the confidence, and strong in the might, of undivided and invincible unity!"

"That strain I heard was of a higher mood,"

pitched to a higher key than we usually hear from such a quarter, though we know no good reason why it should

be so. The encountering of a passage like this, amid the stormy columns of a political journal, comes upon us with the same feeling of refreshing relief with which we step aside from a hard dusty road to a grassy path, from whose elastic turf our step springs more lightly, over whose green bosom the air breathes more freshly, and where every object meets the sense through a subduing and softening medium, relieving the glare, and stilling the noise, which had oppressed and wearied us. We wish it were oftener the case, that the conductors of our more influential journals of all parties, than whom there can be none better qualified by talent and education, and who occupy a position so secure that they incur little risk in leading, rather than following, the popular taste, indulged themselves in the relaxation of writings addressed more to men, in their widest and most enduring relations, and less to mere political partisans or opponents; that they sought to redeem from the service of party, and restore to their rightful employment, those talents and acquirements which were meant for mankind; that they threw themselves open to the ambition of being writers, not for a day or for an age, but for all time. There would be nothing in this inconsistent, so far as we can see, with the most zealous fulfilment of their duties as exponents and defenders of the views of the great parties in the state, as long at least as those duties continued to be worthy of having the energies of honourable and independent men employed upon them; while the good effect resulting from impregnating with the loftier elements of thought, a stream whose flow is so unintermitting, and which penetrates so deeply into every nook and corner of society, would be beyond our utmost power of estimating it.

We are not going to comment upon the article of *The Times* which we have quoted, but rather to follow out a train of thought of our own which it has suggested. We therefore do not here enter on the general question of the utility of Mechanics' Institutes and similar associations further than to express our agreement with the opinion of *The Times*, that everything in regard to them depends upon the conditions under which they subsist, and the management by which they are regulated. In themselves they are nothing more than a mere guarantee for a certain amount of mental activity, which may be valuable or mischievous according to the direction which is given to it. To deery them as necessarily and incurably mischievous, or to hold them up as the grand and unfailing instrument of social renovation, were equally unreasonable and untrue. Abstracted from their conditions and management, they can scarcely be said to have any moral quality at all; they have little or no spontaneous tendency either to good or to evil; they are but instruments—most powerful, it may be irresistible, instruments—but the effects of which are entirely dependent upon the manner in which they are employed. But this is not the subject upon which we wish at present to dwell.

There is no more indispensable qualification for the man who desires, in whatever sphere, to exercise a moral influence over society—whether as statesman, preacher, politician, or public writer—than the capacity to discern, and the disposition to recognise and acquiesce in, the inevitable facts of our condition, so that his efforts may be directed where they can be available for good, not wasted upon that which they are altogether powerless to affect. What Burke says of statesmanship, that it is the most eminent criterion of a wise government "well to know the best time and manner of yielding what it is impossible to keep," applies with equal truth to every mode of dealing with men in society. Natural forces may be directed and regulated—guided into channels in which their operation may be made subservient to the designs of the most enlightened philan-

thropy; they cannot with safety be compressed or imprisoned. It is in this view, we think, that they are most apt to err, whose opinions lead them to apprehend danger to society from the increasing strength and influence of those classes of the people among whom the greatest amount of ignorance prevails regarding the right uses to which strength and influence should be applied. They are not wrong in thinking that it were well for society if the wise and well-instructed only were strong; if none had influence over the current of events but those who understand aright in what direction the current ought to flow. They are quite right in desiring to separate power from ignorance; but, in their endeavour to do so, they often pull at the wrong end, because they do not sufficiently consider which of the two they can succeed in moving—that the one is the result of a natural progress, moving onward as steadily and irresistibly as the earth round its axis, while the other is a blot, a defect, not necessary or inevitable, but the simple consequence of neglect or evil training. A father who allows his son to grow up from infancy without putting himself to any trouble to cultivate his affections or moral principles—whose only instrument of parental discipline is a blow—who has instilled into him no motive to obedience but fear, finds it, no doubt, a very inconvenient and troublesome thing, that the young man at last becomes too strong to be struck with impunity, and that thus his only instrument of control has slipped from his grasp. He feels it to be an overturning of the moral arrangements of nature, that a violent and unprincipled youth should be able to set his father at defiance, and even to terrify him into submission—to command where he ought to obey; but he did not reflect, while the matter was in some degree under his control, that though he could not prevent the boy from growing up to be a man, nor his limbs from hardening into strength, he might have so trained him to habits of obedience and filial duty, and, by the exhibition of his own character as an object of esteem and veneration, have so laid up for himself in the young man's mind a store of love and reverential affection, that the strength, which now beats down and destroys all his comfort in life, might have been the stay and support of his advancing age.

There can of course have never been a period in the history of society in which there were not many such inevitable facts as we have referred to—circumstances in the condition of mankind, and affecting the mutual relation of the different orders of the people, which flowed from causes operating in entire independence of any individual or collective will; but we do not believe that any point in past time can be indicated in which these facts were so numerous—so widely diffused—and so uncontrollable in their development, as at the present day. The popular destinies are becoming, whether happily or unhappily it is to little purpose to inquire, every day more and more emancipated from the government of any modification of human will, and are being committed to a stream, the sources of which lie deep in the unchangeable laws of nature. Progress—a word expressive of a truth so plainly written up before us wherever we turn, and therefore so universally acknowledged, that it is in imminent danger of degenerating into the hackneyed valueless counter which cant passes upon us for the genuine coin of thought—is the great law of the present condition of society. At the remotest extremities of the body the moving principle is at work; the progressive energy is felt from the heart to the finger points; the whole system is pervaded by a living and germinating power, which at every point is shooting forth into blossoms fast ripening into fruit. We are every now and then startled by some opening in our field of view suddenly revealing to us the rapid strides with which the whole of society is moving onward to some unknown goal. Time, the greatest and most effectual of innovators, but who usually, according to the aphorism of Bacon, so slides in his innovations as to

elude the sense,¹ would appear almost to have changed his character, and to be now hurrying them on so rapidly that the hand can be seen distinctly moving over the dial.

We have said that it is vain to inquire whether it is happily or unhappily that the destinies of mankind are becoming every day more committed to the operation of the natural law of progress; not that we do not consider it a very interesting speculative inquiry, or that it is not one which is capable of being solved, but that it is out of place in any discussion whose objects are practical, because it cannot lead to any practical results. Whether it be desirable or not, it is a *fact* which we cannot control. We cannot cause it to be otherwise. We cannot bid the world stand still, or retrace its steps, whatever we may think of the road on which it is travelling. But something we may do, and that is what it is important for us to inquire into. We may do much to determine the direction of the progress, and to impart their character for good or evil to its results.

The true modes of giving to the intellectual activity, which is so distinguishing a characteristic of all classes of the people at the present day, a safe and beneficial direction, are perhaps many and various; but one most effectual mode does certainly appear to us to be indicated in the concluding sentence of the passage we have quoted from *The Times*. We feel assured that the writer of the article is not mistaken when he says that it is only by "our different ranks of society ceasing to remain so much apart,"—by "there being some common pursuit to bring them together,—some common study to humanize their sympathies and harmonize their affections,"—that we can feel any reasonable assurance that we shall continue to be "an empire bold in the confidence, and strong in the might, of undivided and invincible unity."

The truth of these statements is almost self-evident. So long as the bulk of the people remained a comparatively inert mass, exhibiting the development of no independent energies, but passively submitting to be borne along in obedience to the impulses of the smaller portion of the social body, in which mainly its whole vitality resided, so long it was of little consequence how far any real sympathy subsisted between the two. Where there is no effective will, it matters little how the affections tend. But, when the vital energy is diffused over every portion of the body—when everywhere, to the furthest extremity, there is separate independent action, the preservation of anything like unity or coherence in the whole can only be secured by an entire sympathy between all the parts,—by identity of desires, feelings, and objects,—by "the harmony of their affections." Whether noble or plebeian, rich or poor, illustrious or obscure, there is scarcely a man among us whose separate energy does not constitute a unit in the vast aggregate of power in obedience to which the wheels of society are moved; whose voice does not contribute to swell the grand chorus which, under the name of public opinion, promulgates the law, more powerful than any act of any legislature, to whose decisions every other authority, however high, must ultimately bow. It is therefore now more indispensable than ever, that, throughout all the necessary diversities of circumstance and position which must have place in a large society, and which of themselves tend to create corresponding diversities of feeling and aim, there should be caused to flow a stream of common sentiment and affection, binding all the parts together, by a tie all the more powerful that it is linked around the first and inmost springs of feeling and action.

Let it not be supposed that it is necessary, for this end, that any man should forget or disregard the duties or conventional proprieties of his position in society; that we should cease to select our intimates and asso-

(1) Novator maximus tempus: quidn igitur tempus imitemur, quod novationes ita insinuat, ut sensus fallat?

ciates from among those placed on the same social level with ourselves; or that we should attempt to cure the too great separation of the different classes of society, by mixing them all up together in one discordant and incongruous hash. It is not by abolishing social distinctions, or by attempting to override and crush down the natural feelings which they generate, that we can unite all classes in an harmonious whole. The value of the fusion of sentiment and feeling which we long for, depends entirely upon those distinctions being preserved, and the feelings which they generate respected. They constitute the grace and beauty, as well as an indispensable condition of the stability, of the social edifice. The relation which they establish is one which has its peculiar and appropriate virtues, for the exercise of which, without them, there would be no place, and the observance of which constitutes the strongest cement by which society is bound together. By them "we give to our frame of polity the image of a relation in blood, bind up the constitution of our country with our dearest domestic ties, adopt our fundamental laws into the bosom of our family affections, keeping inseparable, and cherishing with the warmth of all their combined and mutually-reflecting charities, our state, our hearths, our sepulchres, and our altars."¹

For the very reason for which a closer harmony of feeling between the different classes of society is necessary to the general safety of all, is the creating it a work which cannot be got up when we please, or to meet an emergency. It is not a thing to be done by associations and subscriptions, or any such mechanical device. The agency to be employed is entirely moral in its character, and must act upon, and find a re-acting response in, the heart and the affections. But the higher classes—the more educated—those whose position surrounds them with circumstances which vividly impress the imagination, and give, consequently, a weight and influence to every thing connected with them, are those from whom the influence must first emanate. If they wish to infuse generally among those placed beneath them in the social scale a respect for their rights, an attachment to their persons, a faith in the excellence of those social arrangements which have given them their high place, an acquiescence in the justice of those inequalities of condition by which they are so greatly favoured, they must not imagine that they can accomplish this by any kind of agency except that which is fitted by its nature to produce respect, attachment, and submission, in the hearts of free and reflecting men. They must begin, not by professing or simulating,—that will never do,—but by cherishing in their own breasts, and by exhibiting in active operation, that sympathy which they wish to be reflected back upon themselves. *Si vis amari, ama*, is the great and only law of attraction between one man and another.

It will be a happy day for society when we come all thoroughly to understand that the true way to secure our rights from others is carefully to perform our duties to them; that the way to impress the character we want upon those who stand in any relation toward us, is to cultivate in ourselves the corresponding qualities of our relative position. The virtues which make a society happy are not to be produced in obedience to any word of command, or by any mode of persuasion, how eloquent and impressive soever; they will grow only under the genial warmth which is reflected from the growth of corresponding virtues in that quarter towards which their exercise must tend. It is kind masters who make good servants; liberal landlords who make industrious tenants; a paternal aristocracy which makes a contented and respectful people; and, on the other hand, the poorer classes can in no way so surely secure from the rich a generous consideration for their interests, an anxiety for their welfare, and a disposition to uphold their rights, as by excluding from their own minds

those weeds which choke the growth of the social virtues.

Thus, while it is the manifest duty of every one of us to use his utmost efforts to keep the stream of common sympathy and affection in a continuous flow through all the veins and arteries of the social body, the sphere of our exertions is just that precise place in the body which we ourselves occupy. We exercise the most powerful, as well as the most wholesome influence upon society, when we keep ourselves right. The most effective missionary we can send into the lanes and alleys, where the poor are crowded together in festering heaps, is the man who can make his counsels effective in the saloons of the rich. A word spoken there with effect will have a more beneficial influence upon the character of the outcasts of society than a hundred, though conveying the wisest counsels, urged however impressively upon their own ears. A few kind deeds, performed in an earnest spirit, with true sincerity of heart, will do more to make good members of society than a hundred exhortations. How much more sweetly, and we venture to say quite as effectually, would the evils of society be remedied, if, on all sides, when we found anything going wrong in another quarter, we were to look for its cause and its cure among ourselves.

NOTICES OF SOME ANCIENT CUSTOMS OF ENGLAND.¹

WE have already wandered far away from our subject, yet can we not forbear a few more remarks on the "words of power," and of the magical effect ascribed to these ancient forms amongst the Scandinavians, the progenitors of our Anglo-Saxons, amongst whom they were in a considerable degree retained, and even amongst the Anglo-Normans, with whom, we are told, the peculiar forms were so scrupulously observed that "the variance of a word, or the lapse of a syllable, annulled the entire proceeding."

In the learned and most interesting work to which we have been so much indebted, we read that amongst the Scandinavians the law embraced all living things; that, for instance, the beaver had "his house even as his bonde," and if a person accidentally killed the animal, he was bound to make compensation to the lord of the soil, not as indemnification for the loss of the fur, but in consideration of the beaver's "rights as an inhabitant." Ferocious wild beasts were out of the pale of the law, which decreed that "bears and wolves shall be outlaws in every place;" and yet even these animals seem on occasion to have been treated with chivalrous courtesy, and the learned editor of an ancient Saga says, that the opinion that "bears have a reasonable knowledge of Danish is yet prevalent in Norway." It is very certain that forms of law (the words of power) were recited against the animal creation with as much formality and solemnity as even against the human race; and it was supposed in the Middle Ages, that noxious vermin, rats, mice, and even insects, would obey the decree of a civil tribunal, by which they were frequently excommunicated according to law. Nay,

(1) Concluded from page 48.

(2) We might almost suppose that a similar opinion prevails in India regarding the animal which Thomson calls "wisest of brutes;" for Bishop Heber, in his journal, writes, when speaking of the elephant on which he rode with Lord Amherst, "I was amused with one peculiarity which I had never before heard of; while the elephant is going on, a man walks by his side, telling him where to tread, bidding him 'take care;' 'step out;' warning him that the road is rough, slippery, &c., all which the animal is supposed to understand, and take his measures accordingly."

(1) Burke.

even in the proceedings which the superstition of the Scandinavians impelled them to take against disembodied spirits, vampires, demons, &c., we are told that "le seul remède contre ces apparitions est de couper la tête et de bruler le corps de ceux qui reviennent. Toutefois on ne procède pas sans forme de justice; on cite et on entend les témoins; on examine les raisons," &c. &c.

For this vampire, continues our author, feared not holy water, fled not before the hallowed relics, defied bell, book, and candle; exhumation, and burning alone, could quiet him; yet was this proceeding not resorted to until, upon *legal evidence* of the vampire's crimes, the magistrate issued a formal decree to that effect. Even in bargains with the Tempter, concludes he, we always find a valid, if not a good consideration, and a bond, signed and sealed in *due form of law*.

It is probable that the difficulty of obtaining the requisite number of compurgators, even in cases where there could be little moral doubt of the innocence of the accused party, led originally to that "appeal to heaven," which, in the various ordeals into which it branched, forms so picturesque a feature in the legal proceedings of the Middle Ages.

And it was not merely a task of immense expense and labour to the reputed criminal, to obtain these oaths, where a great multitude of compurgators was required, but it was a wearisome task on the patience and penetration of the judges, to sift the conflicting testimonies, and to ascertain the worthiness of the compurgators. Therefore, they seldom opposed the "appeal to heaven," which a harassed defendant might propose; and the clergy, from obvious motives, supported ordeals, which were always under their peculiar inspection, and added much to their influence in judicial matters. Therefore, about the time of the Conquest, though the compurgation was by no means extinct, indeed was assuming more of that character which afterwards became the law of the land in the trial by jury; still, about this time, the various ordeals were universally appealed to.

They were very various; but those most used in England were the ordeal of cold water—of hot water—of hot iron—of the corsned—of the cross—and finally, of the judicial combat.

These ordeals, though appearing to us rude, barbarous, and cruel, were, nevertheless, imposingly solemn in their details; and we must not forget that they were a solemn appeal to heaven, and that the result was *fully believed* by the people, to be the especial judgment of the Almighty. Therefore was every due preparation made by fasting, by prayer, and by other religious ceremonies. Mass was performed, the Eucharist administered, and the most earnest appeal that could be framed, was made to the party *not* to undergo the ordeal, unless his conscience acquitted him of the crime.

In the cold water ordeal, the accused person being thrown into a well or pool, with his limbs bound, was, if he sank, pronounced innocent, and rescued before he could receive material injury. Did he float, which, in the natural order of things, and before cork jackets were invented, was scarcely possible, he was pronounced guilty, and treated accordingly.

In the ordeal of hot water, the accused person plunged his arm into boiling water, and drew out a

stone placed therein for the purpose. The arm was instantaneously enveloped in a wrapper by the attendant priests, and not opened for three days, when if no marks of scalding appeared he was acquitted.

In the hot iron ordeal, the criminal either carried a ball of hot iron in his hand for the distance of nine feet, or walked blindfolded and bare-footed, over nine burning plough-shares, placed at equal distances. The scorched limb was instantaneously enveloped, as in the former ordeal, and not opened for three days. There is no doubt that much collusion was practised with regard to these hot water and hot iron ordeals, and that they *might* be performed, were the officiating priests so disposed, with almost perfect safety.

The corsned was a piece of consecrated bread and cheese, swallowed at the altar; an appeal having previously been made to heaven to cause the attestator to be choked, should he really be guilty. It is this ordeal to which Earl Godwin appealed in testimony of his innocence of the lady Emma's death, when, as our story-books tell us, he was choked at the banquet.

There were various modes of applying the ordeal of the cross. In criminal trials, the ceremony was usually thus conducted. When the prisoner had declared his innocence upon oath, and appealed to the judgment of the cross, two sticks were prepared exactly like one another in all respects, save that on *one*, the figure of a cross was cut. They were severally folded in white wool, and laid on the altar, or on the relics of the saints; after which, a solemn prayer was put up to God, that he would be pleased to discover, by evident signs, whether the prisoner was innocent or guilty. These solemnities being finished, the priest approached the altar, and took up one of the sticks. If it proved to be the one marked with the cross, the accused person was pronounced innocent, if it were the other, he was declared guilty.

The appeal in civil cases was disgusting and absurd.

Being assembled in a Church, each party chose a priest, the youngest and stoutest that he could find, to be his representative in the trial. These representatives were then placed on each side of some marked or famous crucifix; and, at a signal given, they both at once stretched their arms at full length, so as to form a cross with their body. In this painful position they continued to stand while divine service was performing; and the party whose representative dropped his arms first, lost his cause.

The judicial combat, though one of the most ancient and universal ordeals, is not mentioned in the Anglo-Saxon laws, and seems to have been not much appealed to in England until after the Conquest. It is so familiar to all readers, that it is quite unnecessary to dwell on it; but it may not be so well known that the fair sex, who in our own country were ever permitted a champion, were accustomed elsewhere to "do battle" for themselves. There is a duel of this sort quoted in an ancient German Customal, quoted by Sir F. Palgrave, in which we find that, in order to equalize the strength of the combatants, the hero was placed in a circular pit, in which he stood as low as his girdle, armed with an oaken club or staff, of the length of a good cloth ell. The heroine was furnished with a sling or rope of equal measure, at the end of

which was tied a heavy stone. With this weapon she endeavoured to fell her antagonist, whilst he, on his part, sedulously tried to twist his club in the sling; for, if he did this, as the sling was tied fast to her arm, the fair one would be at his mercy. Sorry are we that our author omits to relate the event of this peculiar "joust à l'outrance."

However well suited to the exigencies of a rude and semi-barbarous people the judicial combat might be (and there appears to be little doubt that under the strict regulations to which it was subjected it was well adapted), still does it seem lamentable that, stript of all its most ennobling adjuncts—the fair trial of skill, the masterly exercise of noble weapons—for not then was it the death-giving stroke of the murderous pistol—it does seem sad that thus degraded, thus brutalized, the judicial combat should yet remain; should yet remain in that existing abuse by which every domestic charity is broken; every holy feeling of parent, or kindred, or friend, is despised; every ordinance of God is sacrificed; and every decree of heaven contemned—the DUEL.

A more unequivocal and decided advantage than the judicial combat is attributed to the Norman Conqueror, viz. the Trial by Jury. The Anglo-Saxon trial by compurgators offered, however, a strong resemblance to a jury; and though a rule more defined and arranged was introduced by the Conqueror, it was not established by statute, and came into common use by very slow degrees; not perhaps till the reign of Henry the Second, when a law was made allowing a defendant to prove his innocence either by battle, or "by a jury of twelve men." For to each department of government may be applied the definition given by Sir James Mackintosh to government itself:—"A bundle of usages, the object of respect and the guide of conduct long before it is embodied, defined, and enforced in written laws."

One of the most remarkable and most efficacious of William's acts was the compilation of the Domesday Book—a book invaluable as a reference even at this day, and characterised as "if not the most ancient, yet, without controversy, the most venerable, monument of Great Britain."

As such, a few brief remarks on it can hardly be deemed out of place here.

The volumes are preserved with the greatest care; no person is allowed to touch the writing. There are various copies extant.

It is a general survey of the country. Alfred had made such a one, which was extant so late as the reign of Edward the Fourth; but it is probable that his was by no means so minute and particular as the one which William made; and it is certain that the Saxon monarch's details of lands and property were nullified during the Conqueror's reign, when all the estates of the country passed into Norman hands, to the prejudice, and almost to the extinction, of the native owners of the soil.

"Therefore," says the Saxon Chronicle, "the king had a large meeting, and very deep consultation with his council about this land; how it was occupied, and by what sort of men. Then sent he his men over all England into each shire, commissioning them to find out 'how many hundreds of hides were in the shire, what land the king himself had, and what stock upon the land, or what dues he ought to have by the year from the shire.' Also

he commissioned them to record in writing 'how much land his archbishops had, and his diocesan bishops, and his abbots, and his earls; and though I may be prolix and tedious, what, or how much each man had, who was an occupier of land in England, either in land or in stock, and how much money it were worth.' So very narrowly, indeed, did he commission them to trace it out, that there was not one single hide, nor a yard of land; nay, moreover, (it is shameful to tell, though he thought it no shame to do it,) not even an ox, nor a cow, nor a swine was there left, that was not set down in his writ."

The excellent plan which was devised for the compilation of this survey, and the perfect consistency and regularity with which its details were executed throughout every township, hundred, and shire, afford satisfactory proof that the business of government at this period was conducted with much less rudeness than is usually supposed. It has been found that false returns were made in some particular instances, but its authority, nevertheless, was never permitted to be called in question. Its decree was irreversible; from it there could be no appeal. And this authority, definitive as that of the day of *dome*, or judgment, is said to have given title to the book. It gave deep offence to the people; for not only did it record so irrevocably the deposition of thousands of the sons of the soil from their native roof-trees, but it was looked upon with the deepest suspicion as predicative of some further, and as yet undreamt of, oppression. This, however, if he meditated it, the Conqueror's death prevented.

The Domesday Book consists of two volumes of very unequal size—one folio, the other quarto. They are written on vellum in small clear characters, much intermixed with red ink, and form "the first of the unrivalled series of territorial records which enable us to trace the history of landed property in England from the settlement of the Anglo-Norman monarchy."

A great deal of odium has been popularly attached to William on account of his institution (or rather of his adoption, for it was used elsewhere) of the Curfew Bell.¹ It is probable that the observance of the rule to extinguish fire and candle at a certain hour, was on many occasions too rigidly enforced, and entailed suffering and privation on many persons; but, as a general rule, it was a most highly beneficial one. Almost all the dwellings in the kingdom were at that time of wood; great numbers of them had no more scientific chimney than a hole in the roof, which was usually closed up when the inmates retired to rest; consequently, not merely individual fires, but wide-spreading conflagrations, were of constant occurrence. It was to prevent as far as possible these desolating fires, that strict rules were ordained for extinguishing lights and fires before the usual hour of repose. Another imperative motive, certainly, was the prevention of those secret meetings for "redress of grievances," ending usually in rebellion, which were of almost nightly occurrence in the early part of the Conqueror's reign.

(1) Wordsworth has adopted the common prejudice:—
"Hark! 'tis the tolling Curfew!—the stars shine; . . .
But of the lights that cherish household cares
And festive gladness, burns not one that dares
To twinkle after that dull stroke of thine,
Emblem and instrument, from Thames to Tyne,
Of force that daunts, and cunning that ensnares!"

It is well known that William's death was caused by an accident whilst he was engaged in the burning of Caen. The historians have put a dying confession into his lips, by which "he admonished all those that were present in sayings worthy to be remembered, mixed sometimes with tears;" but as this is in all likelihood entirely apocryphal, we will not introduce it here.

Scarcely had the king yielded his last breath ere all the nobles around him took horse and hastened away. The inferiors, with brutal rapacity, snatched away the armour, vessels, apparel, linen—everything, indeed, that could be removed—and absolutely left the royal corpse untended on the ground.

But the dishonour offered to his remains did not terminate here; for even at the moment of interment, Anselm Fitz-Arthur forbid the burial, because the land in which the grave was prepared had been forcibly and unjustly wrested from his father.

The clergy around the grave instantly offered a reasonable compensation, and the solemnity was concluded.

HELEN WALKER.

It is to be regretted that no fuller account has been preserved of the act of high-minded, persevering courage by which Helen Walker, a simple Scotch maiden, saved her sister from a shameful and unmerited death; voluntarily encountering untold difficulties and dangers rather than speak the one word of untruth, by which she might so easily have gained the same end.

An outline, all that could then be learnt of her adventures, came many years after to the knowledge of a lady, who had the penetration at once to perceive how well fitted was such a history for the powers of the greatest novelist of this or any age. She wrote to the author of *Waverley*, at first anonymously, recounting the story, and the circumstance through which she had learnt it. Subsequently her name was made known to him as Mrs. Goldie, of Craigmure, near Dumfries.¹ He entered as warmly as she expected into the beauty and the merits of her history; and, not long after, the world was at once benefited and delighted by perhaps the most interesting of his romances, "*The Heart of Mid Lothian*," of which this incident forms the groundwork. Helen Walker herself suggested the beautiful character of Jeanie Deans.

Subsequent inquiries have added little that can be depended on to the original account; but we have gratefully to acknowledge the kind and willing exertions of a lady, whose near connexion with Mrs. Goldie best qualifies her for the task, to furnish us with any fresh circumstances which time might have brought to light, correcting, at the same, the misstatements which others have fallen into from the wish to amplify and enlarge on insufficient data.

Helen Walker was the daughter of a small farmer of Dalwhairn, in the parish of Irongray, in the county of Dumfries, where, after the death of her father, she continued to reside, supporting her widowed mother by her own unremitting labour and privations. On the death of her remaining parent she was left with the charge of her sister Isabella, much younger than herself, and whom she educated and maintained by her own exertions. Attached to her by so many ties, it is not easy to conceive her feelings when she found this sister must be tried by the laws of her country for child-murder, and that she herself was called upon to give evidence against

her. In this moment of shame and anguish she was told by the counsel for the prisoner, that, if she could declare that her sister had made any preparations, however slight, or had given her any intimation on the subject, such a statement would save her sister's life, as she was the principal witness against her. Helen's answer was: "It is impossible for me to swear to a falsehood, whatever may be the consequence; I will give my oath according to my conscience."

The trial came on, and Isabella Walker was found guilty and condemned. In removing her from the bar she was heard to say to her sister: "O Nelly, ye have been the cause of my death;" when Helen replied—"Ye ken I bute speak the truth." In Scotland six weeks must elapse between the sentence and the execution; and of this precious interval Helen knew how to avail herself. Whether her scheme had been long and carefully considered, or was the inspiration of a bold and vigorous mind in the moment of its greatest anguish at her sister's reproach, we cannot tell; but the very day of the condemnation she found strength for exertion and for thought. Her first step was to get a petition drawn up, stating the peculiar circumstances of her sister's case; she then borrowed a sum of money necessary for her expenses; and that same night set out on her journey, barefooted and alone, and in due time reached London in safety, having performed the whole distance from Dumfries on foot. Arrived in London, she made her way at once to John, Duke of Argyll. Without introduction or recommendation of any kind, wrapped in her tartan plaid, and carrying her petition in her hand, she succeeded in gaining an audience, and presented herself before him. She was heard afterwards to say, that, by the Almighty's strength, she had been enabled to meet the duke at a most critical moment, which, if lost, would have taken away the only chance for her sister's life. There must have been a most convincing air of truth and sincerity about her, for the duke interested himself at once in her cause, and immediately procured the pardon she petitioned for, with which Helen returned to Dumfries on foot just in time to save her sister's life.

Isabella, or Tibby Walker, thus saved from the fate which impended over her, was eventually married by Waugh, the man who had wronged her, and lived happily for great part of a century, in or near Whitehaven, uniformly acknowledging the extraordinary affection to which she owed her preservation. It may have been previous to her marriage that the following incident happened:—A gentleman who chanced to be travelling in the north of England, on coming to a small inn, was shown into the parlour by a female servant, who, after cautiously shutting the door, said—"Sir, I am Nelly Walker's sister;" thus showing her hope that the fame of her sister's heroism had reached further than her own celebrity of a far different nature; or, perhaps, removed as she was from the home and the scenes of her youth, the sight of a face once familiar to her may have impelled her to seek the consolation of naming her sister to one probably acquainted with the circumstances of her history, and of that sister's share in them.

The manner in which Sir Walter Scott became acquainted with Helen Walker's history has been already alluded to. In the notes to the *Abbotsford* edition of his novels he acknowledges his obligation on this point to Mrs. Goldie, "an amiable and ingenious lady, whose wit and power of remarking and judging character still survive in the memory of her friends." Her communication to him was in these words:—

"I had taken for summer lodgings a cottage near the old abbey of Lincluden. It had formerly been inhabited by a lady who had pleasure in embellishing cottages, which she found, perhaps, homely and poor enough; mine possessed many marks of taste and elegance, unusual in this species of habitation in Scotland, where a cottage is literally what its name declares. From my cottage door I had a partial view of the old abbey before men-

(1) Wife of Thomas Goldie, Esq., Commissary of Dumfries.

Helen Walker.

tioned; some of the highest arches were seen over and some through the trees scattered along a lane which led down to the ruin, and the strange fantastic shapes of almost all those old ashes accorded wonderfully well with the building they at once shaded and ornamented. The abbey itself, from my door, was almost on a level with the cottage; but on coming to the end of the lane it was discovered to be situated on a high perpendicular bank, at the foot of which ran the clear waters of the Cluden, when they hasten to join the sweeping Nith,

'Whose distant roaring swells and fa's.'

As my kitchen and parlour were not very far distant, I one day went in to purchase some chickens from a person I heard offering them for sale. It was a little, rather stout-looking woman, who seemed to be between seventy and eighty years of age; she was almost covered with a tartan plaid, and her cap had over it a black silk hood tied under the chin, a piece of dress still much in use among elderly women of that rank of life in Scotland; her eyes were dark, and remarkably lively and intelligent. I entered into conversation with her, and began by asking how she maintained herself, &c. She said that in winter she footed stockings; that is, knit feet to country people's stockings, which bears about the same relation to stocking-knitting that cobbling does to shoe-making, and is, of course, both less profitable and less dignified; she likewise taught a few children to read; and in summer she 'whiles reared a wheen chickens.'

"I said I could venture to guess from her face she had never married. She laughed heartily at this, and said: 'I maun hae the queerest face that ever was seen, that ye could guess that. Now do tell me, madam, how ye came to think me?' I told her it was from her cheerful, disengaged countenance. She said: 'Mem, have ye nae far mair reason to be happy than me, wi' a gude husband, and a fine family o' bairns, and plenty o' every-

thing? For me, I am the puirdest o' a' puir bodies, and can hardly contrive to keep myself alive in a' the wee bit o' ways I hae tell't ye.' After some more conversation, during which I was more and more pleased with the old woman's sensible conversation, and the *matvets* of her remarks, she rose to go away, when I asked her name. Her countenance suddenly clouded, and she said gravely, rather colouring, 'My name is Helen Walker; but your husband kens weel about me.'

"In the evening I related how much I had been pleased, and inquired what was extraordinary in the history of the poor woman. Mr. ——— said, 'There were perhaps few more remarkable people than Helen Walker; and he gave the history which has already been related here.'

The writer continues. "I was so strongly interested by this narrative, that I determined immediately to prosecute my acquaintance with Helen Walker; but, as I was to leave the country next day, I was obliged to defer it until my return in spring, when the first walk I took was to Helen Walker's cottage. She had died a short time before. My regret was extreme, and I endeavoured to obtain some account of Helen from an old woman who inhabited the other end of her cottage. I inquired if Helen ever spoke of her past history, her journey to London, &c. 'Na,' the old woman said, 'Helen was a wiley body, and whene'er any o' the neighbors asked anything about it, she aye turned the conversation.' In short, every answer I received only tended to increase my regret, and raise my opinion of Helen Walker, who could unite so much prudence with so much heroic virtue."

This account was enclosed in the following letter to the author of Waverley, without date or signature:—

"Sir,—The occurrence just related happened to me twenty-six years ago. Helen Walker lies buried in the churchyard of Irongray, about six miles from Dumfries. I once purposed that a small monument should have been erected to commemorate so remarkable a character;

but I now prefer leaving it to you to perpetuate her memory in a more durable manner."

Mrs. Goldie endeavoured to collect further particulars of Helen Walker, particularly concerning her journey to London; but this she found impossible, as the natural dignity of her character, and a high sense of family respectability, had made her so indissolubly connect her sister's disgrace with her own exertions, that none of her neighbours durst ever question her upon the subject. One old woman, a distant relation of Helen's, and who was living in 1820, says she worked in harvest with her, but that she never ventured to ask her about her sister's trial, or her journey to London. "Helen," she said, "was a lofty body, and used a high style o' language." The same old woman says, "that every year Helen received a cheese from her sister, who lived at Whitehaven, and that she always sent a liberal portion of it to herself or to her father's family." The old person here spoken of must have been a mere child to our heroine, who died in the year 1791, at the age of eighty-one or eighty-two; and this difference of age may well account for any reserve in speaking on such a subject, making it appear natural and proper, and not the result of any undue "loftiness" of character. All recollections of her are connected with her constant and devout reading of the Bible. A small table, with a large open Bible, invariably occupied one corner of her room; and she was constantly observed stealing a glance, reading a text or a chapter, as her avocations permitted her time; and it was her habit, when it thundered, to take her work and her Bible to the front of the cottage, alleging that the Almighty could smite in the city as well as the field.

An extract from a recent letter says, on the subject of our heroine:—"I think I neglected to specify to you that Helen Walker lived in one of those cottages at the Cedar Mills which you and your sisters so much admired; and the Mr. Walker who, as he said himself, 'laid her head in the grave,' lived in that larger two-storied house standing high on the opposite bank. He is since dead, or I might have got the particulars from him that we wanted: he was a respectable farmer."

The memorial which Mrs. Goldie wished to be raised over her grave has since been erected at the expense of Sir Walter Scott. The inscription is as follows:—

This stone was erected
by the Author of Waverley
to the memory of
HELEN WALKER,
who died in the year of God MDCXCII.
This humble individual
practised in real life
the virtues
with which fiction has invested
the imaginary character of
JEANIE DEANS:
refusing the slightest departure
from veracity,
even to save the life of her sister,
she nevertheless showed her
kindness and fortitude
in rescuing her
from the severity of the law,
at the expense of personal exertions
which the time rendered as difficult
as the motive was laudable.
Respect the grave of poverty,
when combined with the love of truth
and dear affection.

Jeanie Deans is recompensed by her biographer for the trials through which he leads her, with a full measure of earthly comfort; for few novelists dare venture to make virtue its own reward; yet the following reflection shows him to have felt how little the ordinary course of Providence is in accordance with man's natural wishes, and his expectations of a splendid temporal

reward of goodness:—"That a character so distinguished for her undaunted love of virtue lived and died in poverty, if not want, serves only to show us how insignificant in the sight of heaven are our principal objects of ambition upon earth."

A CHRISTMAS PARTY IN THE COUNTRY.

No. II.

WHEN Alleyn had finished reading, all agreed that Rosaline had a right to love her herbal, and Cyril pronounced his sister "a very Sappho!"

"No, no," said Mrs. Martha Loraine, "Sappho was a heathen, and, thank God, Rose is a Christian. I am most pleased with the last verse, for I do indeed often rejoice at the vicinity of that church, and think it 'looks down blessings on our ancient hall.' I love to remember the time when I was led there by my own dear mother, the oldest of a family which soon became so numerous, and has now dwindled down to your father and myself. I can remember your mother, Justine, when first allowed the privilege of attending the service, clinging to my arm, and restraining her buoyant step to suitable serenity, her sweet blue eyes wandering to the curious monuments of our ancestors, until recalled to her book by my father's whisper, 'This is none other than the house of God, this is the gate of heaven!' Yes, and I remember her standing before the venerable vicar to be examined amongst the candidates for confirmation, and all the holy aspirations she then poured into my anxious ear. I can remember her again, Justine, little older than you are—at this moment you remind me of her, yet those black eyes belong to l'Estrange—and your father stood beside her under that roof, and she went from it his wife, never to return again. She took a blessing with her, and from a foreign land wrote me that she was often with me in spirit, once more worshipping in our own time-honoured church. My dear, dear Justine, may the blessing which was your mother's rest upon you, and may you seek it where she sought it—in that church!"

The solemnity of aunt Martha's manner was felt by all the party, but by none more than by Frederic and Justine, who had been taught to revere the memory of the mother they had lost so early. The entrance of Mr. Loraine and Mr. Barlow broke the silence, and Lucy soon asked for the verses promised by her mother.

"Are they quite new, mamma?"

"Quite new, I only received them this morning."

"This morning! By the post?"

"Yes, by the post. Agnes was wondering about my three letters, and I expected her to inquire whom they were from; but Edmund's epistle put all other things out of her head, so I kept my own secret; and now hear what our Laureat has sent us."

"James Hamilton, mamma! can he not come? What keeps him away? Rose! Rose! did not mamma tell you James Hamilton had sent some verses for us?" exclaimed three or four voices at once.

"Gently, gently, my good people. James is kept away by his brother's illness, and will be here as soon as he can comfortably leave him. He says he has sent us a few floral charades, that we may not quite forget him during his absence, and begs we will only have one each evening, and then, perhaps, they will last until he makes his appearance."

"Oh, mamma, how many are there?—Aunt Martha, do not you know? Mrs. Barlow, has not mamma told you?"

Both ladies shook their heads, and acknowledged their ignorance on the subject; and at length Mrs. Loraine read the following charade, and the remainder

of the evening was spent in guessing its meaning, and criticising its structure.

"Silently, gently, and lightly descending
From heaven, my first may be seen;
A mantle as soft to the sleeping earth lending,
As you ermine the breast of fair beauty defending
From the winter's breath chilly and keen.

And look where my second is tremblingly stealing
Down the cheek of that beauty so fair;
It comes from the heart's tender fountain of feeling,
A treasure more dear to her lover revealing,
Than its types the chaste pearls in her hair.

And soon, when my first from the earth is retreating,
And my second beguems every spray,
To that beauty shall hope, her sweet whisper repeating,
Show my delicate whole, which the spring's smile is greeting,
And predict—"He returns, gloomy winter's away!"

The snow, which had fallen in great quantity during the night, still continued to descend, so that the whole landscape around Kirkfield was enveloped in its white mantle, the only relief to the eye being from the numerous hollies and other evergreens, on which it had indeed lodged in ponderous masses, but which still showed here and there the bright green leaves and red berries. The windows of the saloon, opening to the ground, were blocked up high as the first pane, and the innumerable tribe of robins, chaffinches, sparrows, &c., which Agnes Lorraine and her little friend Laura Barlow delighted to feed, could not receive the usual bounty until a space was cleared away for their accommodation. The cold wind and falling snow swept in at the opened window, which Mrs. Lorraine and Mrs. Barlow hastily begged might be closed; and the girls stood watching their feathered friends for some minutes, amused by the airs of a robin who seemed to consider himself lord of the feast, driving away the other birds when they interfered with his repast, shaking the snow off his wings, pecking at the window, and looking up with his merry eye as if conscious that he was an established favourite.

"Cousin Frederic," said the saucy Agnes, "have you any birds except sparrows in London? I always fancy not. Do come and look at our country sparrows. They are quite a different colour from yours, are they not? I suspect yours are almost black, and these are beautifully dressed in various shades of brown. I know you have sparrows in London, because I remember reading in the 'Peacock at Home,' that

"A London bred sparrow, a pert forward chit,
Danced a reel with Miss Wagtail, and little Tom Tit."

"Upon my word, Miss Agnes, pert forward chits are not confined to London," said her cousin, running his hand through her clustering curls, and then spinning the laughing girl round so suddenly that the whole flock of feathered pensioners took flight. They, however, soon ventured to return, and Justine l'Estrange was tempted to look at them, and compelled to declare she was unacquainted with several of the visitors.

"Agnes is a saucy girl, Justine, and not at all like her brother Charles," said Charles himself; "but, if it be a fair question, I should like to ask how many British birds you do know? Come now, a sparrow we will presume upon your knowing—what next?"

"I know a swallow, a bulfinch, a canary—"

"Oh, but a canary is not a British bird."

"Well, I know a swallow, and a bulfinch.—Lady Dorrington has a most beautiful bulfinch, which whistles all Strauss's waltzes; and is such a favourite with her, because her son, who had been absent many years, an *attaché* to the Embassy, a fine young man, brought it her from Vienna."

"Then that bulfinch, certainly, was not a British bird, Mademoiselle Justine. I shall not let you go

rambling after fine young men. I am a fine young man myself, and, as I am bringing up to the bar, I shall make you undergo a rigid cross-examination. How many British birds do you know? A turkey?—with oyster sauce. A goose?—with sage and onions. A partridge?—with crumbs and bread sauce. A pheasant?—ditto. A woodcock?—with a toast; and a snipe? because I shot one yesterday."

After a little more joking Justine was obliged to confess her ignorance of British birds, and Agnes and Laura were delighted to point out to her the different competitors for their crumbs; particularly the little blue-bird, or Nun, which soon joined the circle.

"I think your cousin should not begin her ornithological studies before she has made a little more progress in botany," said Mrs. Barlow, "or you will frighten her back to town as soon as the snow is cleared away."

"My dear madam! you must not think me so indolent as to take fright at the bare idea of information, though this is truly very different to any I have received before, because it comes in a practical and amusing shape, instead of being a mere vocabulary of names, which is all I seemed to gain from books in the town."

"You need not be afraid, Justine," said Mrs. Lorraine, "for we are not very learned here; though Agnes talks of botanizing, we are not botanists, but lovers of wild flowers."

"But, my dear mamma, my darling 'Meadow Queen,' is a real botanical book, and Lindley's 'Ladies' Botany,' and Mrs. Mariat's 'Vegetable Physiology,' are very favourite books with my sisters," cried Agnes.

"So they are, my love, and Justine shall read them when she chooses. Still, Justine, the knowledge we can impart is chiefly the result of observation on the things around us, things to which you have never been accustomed; but, as we hope your residence here will not be of very short duration, we shall be greatly pleased if you can feel an interest in them; and my girls must look to you for much information which is very desirable for them, and which they have had no opportunity of acquiring here."

"My dear Justine," said Sophia, "I have not forgotten that you promised to teach me that beautiful new kind of embroidery which is in your work-basket. I fear I have not all the proper materials, but, if I can find any which will put me in the way of acquiring the stitch, I should be glad to learn it this morning; and when we do go to R—, I can then get a proper supply."

"What are we poor fellows to do this morning?" asked Charles.

"Cyril has quietly stolen away to his Hindostanee in the library, where I should fancy you might also find something to study," said his mother.

"But what is to become of this idle fellow Fred?"

"Oh! I am going to copy out this little German song for Lucy."

"Then, as Alleyn is with his father, Neville must be reader to our circle to-day. What book shall we have? There is the last new parcel from the book-club on that table: so perhaps Mrs. Barlow or aunt Martha will make the selection."

Aunt Martha soon fixed upon a work of general interest, and the morning passed rapidly in spite of the increasing storm without. Long after the usual hour no post had appeared, and it was surmised that the cross-roads must be so completely blocked up that none could be expected. Agnes petitioned that James Hamilton's budget might be opened, and an additional charade allowed them, to make up for the loss of the letters and newspapers.

"They are all about flowers," said her mother, "and I fear your cousins will not be able to guess them until they have increased their acquaintance with the Flora Kirkfieldensis, yet I really think I will indulge you with one, which speaks so much of the delights of summer weather, that it will perhaps make us forget the cold around us."

"Mamma!

'Oh, who can hold a fire in his hand
By thinking on the frosty Caucasus?
Or stay the hungry edge of appetite
By bare imagination of a feast?
Or wallow naked in December's snow
By thinking on fantastic summer's heat?"

"Fye, fye, Rosaline! surely you will not vote against
the charade. I shall make you read it for doing so."—
And Rosaline read,

Oh, who would linger when gay summer calls
From every flowery mead and bosky dell?
Oh! who would linger 'neath the city's walls
When waves upon the wind the heather bell?
When the green corn-fields' promise 'gins to swell
The filling ear? When silence at high noon
Doth of the songsters' callow younglings tell?
Who can resist the voice of merry June,
When Nature in reply doth every heart attune?

Now ventures forth my *first* with buoyant grace
And light step, wandering thro' the grassy lane;
Health spreads its mantling blushes o'er her face,
And shyness doth her spirits flow restrain;
Soon as the summit of the hill we gain
And the pure breeze hath fanned her open brow,
To check the gay infection were in vain,
And laughing, warbling, bounding she will go,
Racing to reach the brook which cheers the vale below.

Then bending o'er the streamlet's leaf-fringed side
To watch the sportive minnows glancing gay,
Start back to see my *second* all untied,
And blush to mark its lawless disarray
Reflected there. The wanton eziyls play
With each bright tress, whilst she, with pretty art,
The breeze will chide, and turn her head away,
And rest upon some jutting rock, apart,
To smooth her truant curls, and still her beating heart.

Sure 'tis a pleasant picture thus to see
That fair young creature cast her eyes around,
Half-closed, yet sparkling with a covert glee,
Scanning the summer treasures which abound
On the o'erarching rock—its summit crowned
By plume of waving fern, whilst hanging there
My *whole* in verdant clusters may be found,
Scattering all moisture to the thirsty air,
And flinging from its leaf each dew-drop glittering fair.

A good deal of discussion followed, and ere long the
solution was found to be Maiden-hair.

POPULAR YEAR-BOOK.

December 6.—*St. Nicholas' Day.*

ST. NICHOLAS, who is commemorated on this day by the Latin and English Churches, was born at Patura, a city of Lycia, of reputable parents, who early initiated him into the doctrines of Christianity, which he practised in so exemplary a manner as to receive the patronage of Constantine the Great, through whom he became Bishop of Myra. He was present in the Council of Nice, where, it is said, he gave Arius a box on the ear. According to legendary story, he was disposed so early in life to obey the directions of the Church, that, when an infant at the breast, he fasted on Wednesday and Friday, sucking but once on each of those days, and that towards night. This circumstance, and a miracle which we shall immediately relate, caused him to be regarded as the peculiar pattern of the "rising generation" under the endearing title of "Child Bishop." The miracle is as follows. An "Asiatic gentleman" sent his two sons to Athens for education, and ordered them to call on St. Nicholas for his benediction. On arriving at Myra with their baggage, they took up their lodging at an inn, intending, as it was late in the day, to defer their visits till the morrow; but, in the

mean time, the landlord, to secure their effects to himself, wickedly murdered the youths in their sleep, cut them up, salted them, and purposed to sell them for pickled pork. St. Nicholas was favoured with a sight of these proceedings in a vision, and in the morning went to the inn, and reproached the host for his horrid villany. The man, perceiving that he was discovered, owned his crime, and entreated the Saint to intercede for his pardon. The Bishop, being moved by his confession and contrition, besought forgiveness for him and supplicated restoration of life to the children: whereupon the mangled and detached pieces reunited, and the reanimated youths threw themselves at the feet of St. Nicholas, who raised them up, exhorted them to return thanks to God alone, gave them good advice for the future, and sent them with great joy to prosecute their studies at Athens. This tradition concerning St. Nicholas, were there no other, sufficiently accounts for the selection of his festival for the commencement of the puerile solemnities about to be described.

Anciently, on this day, the choir boys in cathedral churches chose one of their number to maintain the state and authority of a bishop, for which purpose he was habited in episcopal robes, wore a mitre on his head, and bore a pastoral staff in his hand; his fellows for the time being assuming the character and dress of priests, yielding him canonical obedience, taking possession of the church, and performing all the ceremonies and offices which might have been celebrated by real ecclesiastics. Though the election of the child bishop was on the 6th of December, yet his office and authority lasted till the 28th. On the Eve of the Holy Innocents this personage, and his youthful clergy in their copes, and with burning tapers in their hands, went in procession chanting versicles, made some prayers before the altar, and sang Complin. By the statute of Sarum no one was to interrupt or press upon the children during their procession or service in the cathedral, upon pain of anathema. It appears that the boy bishop, at Salisbury, held a kind of visitation, and maintained a corresponding state and prerogative; and he is supposed to have had the power to dispose of prebends that fell vacant during his episcopacy. If he died within the month he was buried like other bishops, in his episcopal ornaments; his obsequies were solemnized with great pomp, and a monument with his effigy¹ was erected to his memory.

The juvenile observances, above described, existed not only in collegiate churches, but in almost every parish in England; and, as Walton affirms, even in common grammar-schools. They were suppressed in 1542 by a proclamation of Henry VIII.; but were revived under Queen Mary, and seem to have been exhibited in country villages till the latter end of the reign of her successor. "We may observe," remarks Strutt, "that most of the churches in which these mock ceremonies were performed, had dresses and ornaments proper for the occasion, and suited to the size of the wearers, but in every other respect resembling those appropriated to the real dignitaries of the church." Brand is of opinion that the *montem* at Eton is only a corruption of the ceremony of the boy bishop and his companions, who, upon being prevented from mimicking any longer their ecclesiastical superiors, "gave a new face" to their festivity, and began their present play at soldiers and electing a captain. Within the memory of persons alive, when the above antiquary wrote, the *montem* was kept in the winter time a little before Christmas: a passage was cut through the snow from Eton to Salt-hill, upon which, after the procession had arrived there, the chaplain and his clerk (Etonians thus disguised) used to read prayers; and then, at the conclusion, the chaplain kicked the clerk down the hill. The present *Montem* is generally celebrated on Whit-Tuesday, and honoured

(1) Such an one is preserved in Salisbury Cathedral.

by the presence of royalty. It is triennial, and consists at present of a procession of the boys to Salt-hill, where money is collected for the "captain" as a kind of provision against his going to the University. The youths begin to assemble at about nine o'clock in the morning, and at half-past there is what is termed, in the Etonian phraseology, an "absence;" that is,—the boys, in order, march three times round the playing or school-yard, and are each successive time called over by the head master, who stands at his "chamber door." Behind each "fifth-form boy" marches a "lower boy," carrying a white pole, and hence this portion of the school receive the name of "pole-bearers." After this part of the ceremony, sundry stout fellows are placed at all places of exit, armed with staves. At ten, the boys begin to set out for Salt-hill, and "dire is the rout, and dreadful is the squeeze," since the only permitted way is through the cloisters, and thence into the playing fields; and the latter passage is narrow in the extreme. When the crowd is fairly out, the "pole-bearers" present their poles to be cut in two by the swords of the "fifth form," girded on for that sole purpose. The following personages figure in the procession: a "marshal," who wears the uniform of his assumed rank, and is attended by several pages in dresses of different nations; a "captain," (who is a king's scholar, the head boy of the school, and for whose benefit the montem is held,) attired in the usual regimental costume; a "lieutenant," in the usual dress; an "ensign," to whom is entrusted the college flag; "serjeants" and "corporals," in their proper uniforms; and the "salt-bearers" and their servitors, scouts or runners, who wear every kind of fancy apparel, and carry large embroidered bags for "salt," i. e. "voluntary contributions." The proper number of the salt-bearers is only two, but they are aided by several of their schoolfellows.

On the morning of Montem day they frequently rise as early as six o'clock, and forthwith scour the country, soliciting or demanding money from every one whom they encounter. Having collected the "salt" from the company, the salt-bearers, &c. levy a contribution from the boys of at least one shilling each, which, in the whole school, amounts to upwards of thirty pounds. When the procession arrives at Salt-hill, the college flag, inscribed with the motto *Pro More et Monte*, is waved three times by the ensign, who stands on the summit of the mound. The fifth form then dine by themselves, and the lower boys, by themselves: and the procession returns to Eton about five. The day after the Montem the captain gives an elegant *dejeuner a la fourchette*, to the first two hundred boys, in the College Hall.

December 9.—The illustrious poet JOHN MILTON was born on this day, 1608, in Bread-street, London. He received the rudiments of a learned education at St. Paul's School, and afterwards studied at Christ's College, Cambridge, where he was admitted, Feb. 12, 1624. Dr. Johnson is "ashamed to relate what he fears is true, that Milton was one of the last students in either University that suffered the public indignity of corporal correction." He was well skilled in Latin, and wrote verses in that language with classical elegance. He began his travels on the death of his mother in 1637, and passed fifteen months in visiting Paris, Florence, Rome, Lucca, Venice, and Genoa. On his return home he took a house in Aldersgate-street, London, for the reception of scholars. In 1641 he began to engage in the controversies of the times, and wrote several polemical treatises. Two years later, he married his first wife, the daughter of a country gentleman in Oxfordshire, whom he soon repudiated. After the martyrdom of King Charles I, he was appointed Latin Secretary to Oliver Cromwell. In 1654, or perhaps earlier, he became totally blind, a misfortune which his enemies considered as a judgment from heaven. At the Restoration he retired into obscurity, and by the exertion of his friends was included in the general amnesty. His immortal poem, entitled *PARADISE LOST*, the copyright of which he sold for only 10*l.*, was pub-

lished in 1667. He died in 1674, and was interred near his father in the chancel of St. Giles's, Cripplegate.

December 13.—St. Lucy's name occurs in the Kalendar of the Church of England on this day. She was a young lady of Syracuse, who preferring a religious single life to marriage, gave away all her wealth to the poor. Having been accused by the nobleman who sought her hand, to the Pagan Proconsul Paschasius, for professing Christianity, she obtained the crown of martyrdom, A. D. 304. Her remains long reposed at Syracuse. They are now preserved in the Church of St. Vincent, at Metz.

LOUISE, OR THE FAIRY WELL.*

AFTER pausing for a moment to admire the delicate tracery and the foliage of the sculptor, and dwelling for some moments on the maxims over her head, she tripped forth lightly into a conservatory filled with rare plants and curious shrubs, the splash of water falling continually into hollowed basins of pure white marble filled her with delight; here several large bees, such as she had previously seen, were flitting about, and many birds of bright plumage had built their nests in the taller shrubs. On her approach, the birds nestled down in their nests, and covered their little heads with their wings; and the bees alighted on the different flowers, and found a shelter in their wide spreading cups. "Oh, how charming!" said Louise, "I will catch one of these little birds, to see the bright colours of his plumage." She raised herself up to the lowest shrub, and as soon as she put her hand into the nest, the little terrified creature uttered a shrill cry, which was taken up by all the others, so that the conservatory resounded with their piteous notes. Fear for the moment proved superior to her other feelings, and as soon as she felt more confident, she stretched out her hand a second time, but the nest was gone! Louise, in astonishment, ran from shrub to shrub, peering cautiously into the branches, but the birds had all flown, and she could not even discover their nests. This was a great source of wonder, as she could not imagine how they had made their escape, as the windows that reached from the ribbed ceiling to the marble floor were all closed, and she could see no other means of escape. The bees too had flown away, and she was alone. This circumstance gave her no uneasiness, on the contrary, the hours glided pleasantly away, as she found new attraction in every succeeding flower. Here was the rose in all its variety of tint, here was the graceful lily, the striped carnation, the star-like primrose, and the delicate snow-drop. Here orange and lemon trees bloomed, amid myrtles and acacias; here the most choice treasures of the Eastern gardens grew in all their luxuriance. When she had feasted herself sufficiently on the sweets around her, she turned her eyes to the fountains, in whose waters swarmed myriads of the most tiny fish, frolicking about in the clear glassy element. Soon, however, by degrees, a feeling of languor crept over her frame, and she lost her former vivacity; the charm of the scene died away, and she longed to see and hold intercourse with the bright spirits who dwell in the fairy palace. "What are all the charms" cried she, "of so beautiful a spot to me, if there be none else to enjoy it? what concert so sweet as that of human voices? Oh, for my little companions in the forest glade!"

(1) Concluded from page 95.

As these last words were issuing from her mouth, a merry laugh rang through the conservatory. Louise, guided by its ringing echo, hastened in the direction from which it proceeded, but there was no sign of living being. She discovered, however a doorway, which yielded to a push from her hand, and then closed again behind her so exactly, as to appear but a part of the solid wall. Immediately on her emerging from the conservatory, an indescribable feeling of awe crept over her; the spot on which she stood seemed to inspire holy and devotional thoughts; the mellow light that fell upon the dark marble pavement from the coloured windows, was in unison with the sombre air which pervaded the entire edifice. She was standing in the nave of a venerable structure, with an open ceiling of cedar wood, supported on slender pillars of porphyry, whose capitals were decorated with elegant tracery: beyond fell a deep curtain, separating the nave from the inner building. Louise crept silently to it, and on her approach a deep sound of music burst forth. Simple and plain was the melody, but anon its tones rose and swelled upon the ear, riveting the attention by its beautiful simplicity. All was silence for a moment, and then the melody was heard flowing softly forth again, blended with voices rich and powerful.

"Mortal foot is lurking nigh,
Mortal voice and mortal eye!
None our fairy home may see,
Save those of spotless purity.
Hearts as pure as virgin snow,
Such alone our haunts may know.
Anger, hence, and bitter strife,
And all the foes of earthly life.
Come, if thou be firm of mind!
Go, if fickle as the wind!
Come, if thou wouldst happy be!
Come, if thou wouldst fain be free!
Here is life, and here is pleasure,
There is peace in this bright home,
Peace, the weary mortal's treasure;
Come, oh, come—"

Louise, urged by some impulse, caught up the melody ere it died away, and sang the last few lines in a spirit of reverential awe. She felt no longer the thoughtless child of the forest, roaming only from thicket to glade in search of new delight, careless of aught beyond the present moment; a new light seemed to be dawning upon her, and the thought that life was not without its duties, that all its concerns were not to be centred on self, occurred to her mind, and she began to wonder how it had happened that she had been so long dead to this important truth. This thought gave birth to a thousand kindred reflections, and her imagination presented before her eyes the inscriptions on the archway of the chamber where she had slept. "Ah," said she "full well I know

Life is but a trial at most,

but then follows

Happy they who use it well,

oh, may I be enabled to know that happiness." Pursuing the train of reflections which sprang from the consideration of the maxim, her feelings became o'ermastered by a sense of her former blindness and ignorance, and she fell on her knees in the spirit of prayer; and, though her lips appeared sealed, and her fervour was not manifested in devotional accents, nevertheless her soul was poured forth in prayer, and she was heard. For a long time she continued upon her knees upon the marble floor, with raised eyes and uplifted hands, and when she arose, with a feeling of calm serenity,

the curtain was suddenly withdrawn from before her, at the same moment a film fell from her eyes, and she was in the presence of those beautiful spirits who had visited her in her dreams.

"Thou hast striven," exclaimed the fairy spirits, "and now shalt thou be a child of spotless purity."

They then embraced her, and led her out into a spacious garden, in which stood a circular edifice of shell work, encrusted with moss and curious grasses. Her dream was indeed realised, and Louise recognized the beautiful spot, peopled by the fairies, in their blue silk draperies, fastened by zones of white coral; the gems that glittered upon their brows were of intense brilliancy; the bees were hovering about on their downy wings, and the same birds hopped from spray to spray. They then led her into this circular edifice, singing, and showering roses and sprigs of myrtle along the path, and entered a chamber, on which a throne of crystal was raised upon a dais; on it sat a lady, bright as the morning star, at whose presence all fell with their faces to the ground. The beautiful lady advanced to Louise, and encircling her waist with a coral band, and clasping a diamond on her forehead, greeted her thus:—

"Forget not, my child, what thou hast resolved on this day. The gift of life is no useless boon; we sleep but in the night; the sun rises each succeeding morn to light our path for the day, and however confined and narrow that path may be, we must walk in it, and doubt not we shall find duties to perform ere we reach its utmost limits. They who walk blindly on, forget that life is but a trial, and miss its great object. Thou art young, child, and untainted; and preserve thyself spotless as hitherto, and on thy return to the Schwarzwald, for thou must return for a time, strive for the great reward, and thou shalt visit us again with all now dear to thee."

With these words she returned to her throne, and Louise and her fairy companions left the chamber, and roamed in the gardens. Some gathered the most delicious fruits and presented to her; others plucked the most choice flowers and twined them in her hair. They devised all kinds of sports to amuse her; ran races, and danced in merry groups on the green-sward, exhibiting in their graceful movements the delicate symmetry of their limbs.

When they became fatigued with their games they led her to a clear crystal stream, and invited her to plunge in to cool her glowing limbs. In a moment they were all sporting in the water,—now floating on the glassy surface, now dipping beneath the wave, and then appearing again with their bright locks unbound, streaming over their shoulders, and dripping with spray. After the refreshment of the bath, they led her into a more beautiful apartment than any she had hitherto seen, though its magnificence was somewhat diminished in her eyes, by the appearance of several hideous faces, bearing upon them the stamp of passion, hatred, jealousy, and other feelings that debase mortality. Louise, somewhat terrified by the fiendish glare of their eyes, and their savage mien, inquired of one of the fairies the cause of their dwelling in a spot tenanted by happy spirits.

"See you not," replied the fairy, "they are separated from us by an iron grating; part of their miserable punishment it is, to be spectators of the undying bliss that reigns for ever here; they suffer

unceasing torments in a cold and cheerless spot; here is eternal spring and beauty, ever fresh and blooming; they were blind to the uses of life in the external world, they reaped not the harvest, because they smothered the good seed, and their doom is eternal."

During this conversation, the tables throughout the chamber were loaded with delicacies for a feast; and as soon as Louise and her companions were seated, and the sound of mirth and enjoyment arose, the unhappy beings at the grating uttered loud yells of despair, mingled with execrations at their miserable lot. Meanwhile, the time glided pleasantly away, till the tinkling of a little silver bell gave the hour for returning.

The fairies then signified to Louise, that it would be her duty to keep watch during the night at the mouth of the well; and for this purpose they led her by a winding staircase to the summit of a tower, and bade her look up. Above her was an opening, through which a faint ray of light was streaming, sufficient to assure her that it was the mouth of the old well, and that she was in the neighbourhood of the Schwarzwald. The fairy spirits all embraced her most tenderly, kissing her repeatedly. "I will stay with you for ever," cried Louise, passionately; but they kissed her again, and said, "Thou shalt one day be one of us, but not yet;" and then they bade her be of good heart, and left her. As soon as she was alone, her thoughts reverted to her father's hut, and she longed to know what had transpired during her absence. "Doubtless my father is sorrowing," thought she, "bemoaning his lost child; my mother, too, is weeping, perhaps; and oh, how sad must be poor little Carl, deprived of his dear Louise!" The desire of seeing them again became gradually stronger, till she burst into tears, and sobbed violently, till sleep came to her relief.

She was roused by the sound of an axe, and on opening her eyes she discovered herself on a mossy bank at the mouth of the well. The poor child rubbed her eyes, to convince herself that it was reality, and then exclaimed, "Ah, it must have been a dream,—but what a beautiful one!" but, on putting her hand to her forehead, the diamond circlet was still there, though she was dressed in her blue woollen frock, and wore her straw hat. She concealed the diamond in her pocket, and bent her steps towards the spot where the click of the axe sounded, and in another moment Louise was folded in her father's arms.

How the tears chased one another down the cheeks of the old woodcutter, as he pressed his child to his heart! "Come," said he, "my darling treasure, let us return together to the hut, and rejoice with your mother and little Carl, and you shall tell us where you have been; and we will tell you how we sought you in the forest, day after day, and could discover nothing but the basket."

They drew near the hut, and Gertrude was weeping within. "For a week my child has been torn from me; oh, let me die!"

"Live, live, and happily, too!" shouted the woodcutter, as he entered the hut with Louise in his hand. Gertrude clasped the child to her bosom in a transport of delight, and little Carl kissed her, and then wept, and kissed her again.

The joy at her recovery was not confined to the woodcutter's hearth; the news spread rapidly through the little colony, and all flocked to the

hut, anxious to see Louise, and to congratulate her parents. When the happy family seated themselves round the blazing fire in the evening, the woodcutter pressed his daughter to say how she had missed her path, and in what manner she had subsisted during the week she had been missing; but the child begged him to forbear questioning her, as she could not reveal it. "One day," said she, "father, dear, you shall know all."

Years passed on in their course, and prosperity had smiled upon the simple woodcutter: he was now become the aufseher of the district. He had marked the wisdom that dictated the opinions of his child; nor were her deeds at variance with them, as she preserved one strict line of duty herself, and invited all others to follow her example. She was the friend and counsellor of all: were any unhappy, Louise could restore their peace of mind; were any in doubt or perplexity, Louise was ever ready to aid them; were there any quarrels in the little settlement, Louise was the arbitrator, and always the peace-maker. Loved and respected by all, she continued in one straightforward course, never turning aside to the right or to the left.

The forest leaves were thickly falling, every breeze added numbers to those already crisped and curled on the ground, and the woodcutter felt sensible that he should never see again their green bloom. He was lying upon a couch facing a window that looked upon a forest path: his faithful wife, Gertrude, was supporting his head; his son Carl, now a fine-grown youth, was kneeling by his side, and Louise had just completed the narrative of her visit to the fairy spirits in the happy realms. The old man's eye lighted up with sudden brilliancy. "What see you, father, dear?" cried Louise. His lips quivered, but no sound escaped them. "What see you, father, dear?" repeated the child, and as she stooped to kiss his pale cheek, she heard him whisper faintly, "I come, beautiful spirits, I come." One struggle,—all was over.

They buried him on the margin of the well; and when spring came round, flowers sprang up upon his grave, arching gracefully over it, and Louise knew that her father was happy. The woodcutters immediately elected Carl into his father's office. "Tread thou," said they, "in his footsteps, and thou canst not err." Louise continued with her brother; and the two, knowing that their father's trial at most, endeavoured to "use time well" and won undying bliss with their mother, who had gone before them, and the old woodcutter, in the dwelling of the beautiful spirits of the Fairy Well.

Biographical Sketches of Eminent Painters.

JOSEPH VERNET.

It was at a period when the French school of painting was declining, that Joseph Vernet, an artist distinguished by originality of genius and energy of character, made his appearance. He was born at Avignon, in France, in 1714; and at the age of eighteen he went to Rome, where his works were highly esteemed by the Italians themselves, who seemed to reckon him among the number of their artists.

His choice of the particular style of painting to which he chiefly devoted himself, was decided by the sight of a storm at sea. His sea-pieces gained

him great renown throughout Europe, and his landscapes, chiefly composed of scenes in Italy, were much admired for the excellence of the colouring, and that animation in his figures and groups which may be said to be a distinguishing feature of his works.

Vernet excelled in depicting the motion of water and the velocity of clouds, and if his landscapes do not display a delicacy of touch equal to those of Claude de la Lorraine, he is more animated than that great master in his sea-pieces.

After spending twenty years in Italy, he was summoned to France by Louis XV, to paint views of the ports of that country. Such works fetter the genius of artists, and are not generally interesting in their appearance; but Vernet contrived to produce a striking and picturesque effect in those pictures, at the same time that he represented every object with the utmost exactitude.

He was received into the Academy immediately on his arrival in Paris. Few artists have left a greater number of works. There is scarcely a cabinet in Europe which does not possess some of his pictures. His Italian landscapes are beautiful, and are much prized.

Vernet's personal qualities were of the highest order. Although he was admitted into the presence of royalty, and was courted by the great, he constantly preserved a modest and an unassuming demeanour. If he indulged in luxury, it was not from ostentation, but in order to gratify his feelings of hospitality; and his principal recreation was the society of persons of intelligence.

An interesting anecdote is related of him, connected with our own celebrated landscape painter, Richard Wilson.

It happened that Vernet and Wilson were at Rome at the same time; the former being in the zenith of his fame. One day Vernet visited Wilson's studio, and being struck by the merit of one of his landscapes, he begged to be permitted to give the artist one of his own in exchange for it. Wilson readily agreed to so flattering a proposal, and sent his picture to the distinguished French painter, who generously exhibited it to his visitors, and recommended Wilson to their favour.

Vernet passed through life deservedly respected by all who knew him, even by those who were envious of his talents. He continued to work until within a very short period of his death, without either his body, his mental powers, his genius, or his cheerfulness appearing to be affected or diminished; and he died at Paris, after a short illness, in 1789, at the age of seventy-five, or, as some say, seventy-seven.

Portry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; and Selections, it is printed in Italics at the end.]

BURIAL OF AN INDIAN CHIEF.

On sunny slope and beechen swell
The shadowed light of evening fell;
And, where the maple's leaf was brown,
With soft and silent lapse came down
The glory that the wood receives
At sunset, in its decayed leaves.

Far upward, in the mellow light,
Rose the blue hills. One cloud of white,
Around a far uplifted cone,
In the warm blush of evening shone;
An image of the silver lakes,
By which the Indian's soul awakes.

But soon a funeral hymn was heard,
Where the soft breath of evening stirred
The tall, gray forest; and a band
Of stern in heart, and strong in hand,
Came winding down beside the wave,
To lay the red chief in his grave.

They sang, that by his native bowers
He stood, in the last moon of flowers;
And thirty snows had not yet shed
Their glory on the warrior's head;
But, as the summer fruit decays,
So died he in those naked days.

A dark cloak, of the roe-buck's skin,
Covered the warrior, and within
Its heavy folds the weapons, made
For the hard toils of war, were laid;
The cuirass, woven of plaited reeds,
And the broad belt of shells and beads.

Before, a dark-haired virgin train
Chanted the death-dirge of the slain;
Behind, the long procession came,
Of hoary men and chiefs of fame,
With heavy hearts, and eyes of grief,
Leading the war-horse of their chief.

Stripped of his proud and martial dress,
Uncurbed, unreined, and riderless,
With darting eye, and nostril spread,
And heavy and impatient tread,
He came; and oft that eye so proud
Asked for his rider in the crowd.

They buried the dark chief; they freed
Beside the grave his battle steed,
And swift an arrow cleared its way
To his stern heart!—one piercing neigh
Arose, and o'er the dead man's plain
The rider grasps his steed again.

Longfellow.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

I NEVER yet found pride in a noble nature, nor humility in an unworthy mind. . . . Of all trees, I observe God hath chosen the vine, a low plant, that creeps upon the helpful wall: of all beasts, the soft and patient lamb: of all fowls, the mild and galled dove. When God appeared to Moses, it was not in the lofty cedar, nor the sturdy oak, nor the spreading plane; but in a bush, a humble, slender, abject bush. As if He would by these elections check the conceited arrogance of man. Nothing procureth love, like humility: nothing hate, like pride.—*Feltham's Resolves*.

The Death=Bed.

————— CAN it be
That there are blessed memories joined with death
Of those who parted peacefully, and words
That cling about our hearts, uttered between
The day and darkness,—in life's twilight time?
Oh, I could tell of one whose image comes
Before my inner sight,—I knew her not—
That ancient dame I told thee of, whose eyes
Sought for heaven's glories in the light of earth,
She would speak of her till her heart was full.
And I would weep for childish waywardness,
And long to be as she was. 'Twas her own
And only child; and never from her side

summer's evening, we pursued the path which skirts the summit of the bastions, and so reached the corner of the fortification. The view from this point is enchanting. Behind you, rise the heights of the Königsstuhl, the king's seat, covered with trees of the richest foliage, and, as you stand on the verge of the precipice, which forms the chief defence of the castle on this side, beside you lies the old Rent Tower, mighty in its ruins, like the corpse of a hoary Titan; whilst beyond it, from amidst the trees, the towers and battlements of the palace stretch to the sky in sublime and silent majesty. At your feet lies a blooming orchard, and below it the irregular, quaint looking roofs of the town, dotted with shingled steeples of old fashioned churches. From the black fir woods of the Odenwald, on the far right hand, the river runs swiftly by, whirling in a thousand little eddies; and on the opposite bank lies the lovely Neckar valley, with its fragrant gardens, and vineyards, and orchards; whilst beyond them the hill of All Saints, with the ruined convent on its summit, shuts in the view, and seems to touch the heaven with its lofty peak. At this end the valley is narrow, and the hills draw so close to each other, that there seems to be no egress, and one can scarce imagine that the river extends beyond the stream visible beside the town; but lower down, the glen widens out, the hills recede, and the valley is lost in the vast swelling plain of the Rhine, extending for many a league.

In one of the numerous beautiful little glens which run down from the hills opposite Heidelberg, towards the water side, stands a small plain-looking white house, half hidden by trees, which is pointed out to strangers as the spot where the students' duels take place. It is a convenient theatre for these intellectual entertainments, being so far from the town, that they are not in the general case liable to interruption. The college authorities do, however, sometimes get notice beforehand of a duel, and take measures for interfering between the combatants, though not always with the happiest results, as occurred in the case of an acquaintance of mine, who, by-the-bye, was an Englishman, and ought to have known better. In this instance, the university beadle, armed with all the terrors of his dreaded office, had just reached the door as my friend received a slash across the cheek, and the wounded man, to escape condign punishment, was obliged to leap out of the window and hurry up the valley, with his blood streaming from the gash, so that the wound, of course, not being subjected, as it should have been, to immediate medical treatment, healed but badly, and remains a very pretty scar to this day.

The view of the Neckar valley is to me the most lovely in Germany; and yet this very land, which, in the golden radiance of the setting sun, looks like the garden of the Hesperides, has suffered more desolating ravage from the ruthless hand of war than almost any other in Europe. Tilly devastated it with his murderous hordes of pious savages; the Swedes followed in his steps, both literally and figuratively; but the palm of atrocity was reserved for the French, under Turenne; they burst upon it with merciless fury: but one sack was not enough, and the Palatinate was a second time subjected to such fiendish cruelties that all Europe rung with the horrors committed by them. The destruction of the Palatinate forms a glorious episode in the life of Louis XIV., the Grand Monarque, and there was a quaint cold-bloodedness about the proceeding which makes it interesting. Louis was going to a grand court-ball, when Louvois came and said, "Sire, your army must receive orders to lay waste the Palatinate, and devastate it from end to end." "Indeed," replied Louis, "I am sorry for that, but, if it is proper, of course it must be done;" and so saying he went off to the ball. The orders were immediately despatched, and admirably obeyed. Every house was burned down; the cattle were killed; the vineyards and orchards were cut down and destroyed, and the inhabitants turned out in the

depth of winter to shift for themselves. The garden of Germany was turned into a howling wilderness, where nought was to be seen but the smoking ruins of once happy homesteads, or heard, but the cries of the wretched fugitives perishing with cold and want.

At the upper end of the pleasure-ground is a fine large coffee-house, where were numbers of all ages and sexes seated at tables in the open air, engaged, after the German fashion, with coffee, beer, and tobacco, whilst they listened to the strains of a very fair band, which played almost without intermission. Conspicuous amongst the company were a large party of students, with their little caps of various colours, according to the part of Germany which claimed the honour of their birth, their long hair, and their fantastic dresses. One, in particular, was a delicious specimen of a true Bursch; he was a decidedly handsome young man, with long fair hair curling on his shoulders, and pointed curling beard, dressed in a doublet of black velvet, with a short cloak of the same material falling off one shoulder; he was smoking a pipe of portentous length, and was evidently the hero of the day. On the whole, however, from the little I have seen of these students, I do not think they deserve all the ill that is spoken of them; in fact, the very points most reprehensible in their manners seem to me exactly those which have been most be-praised, such as their renowning, their beer-drinking, and so forth; as to the latter, I really cannot offer any excuse, though it seems to me that the folly must carry its own punishment along with it; for it is impossible to conceive that any one can calmly wait down to drink two or three gallons of small beer without feeling himself degraded in the scale of being; how they ever get it down is to me inconceivable! I should think the torture by water was nothing to it. As to the want of cleanliness and of gentlemanly feeling, of which they are accused, I do not think that, as regards the former, they are more to blame than foreigners in general; and the few I have ever met with intimately, always appeared to me, barring their Burschen eccentricities, quiet gentlemanly fellows. Then, as to their dress, and their attempts to look picturesque, all this is no doubt laughable enough, but I do not know that it is more absurd, and it certainly is as agreeable to others, to see a man dress like a picture of Raphael, than to find a gentleman, by rank and fortune, rigged out like a groom, and attempting to look knowing. In mental and literary acquirements the generality of the students at German universities are, I suspect, quite equal, if not superior to the pupils of our most boasted academies. Not that I at all agree with those, who are such indiscriminate admirers of the German system of tuition, as to wish to exchange our own for it. On the contrary, I conceive, that as, according to the old Scottish proverb, "ilka land has its ain lauch," so the academical institutions of every country will, in the general case, be found best suited to the habits and modes of mind of the youth of that country; and that the indiscriminate adoption of foreign systems of education will, unless great care be taken, introduce principles so much at variance with the national characteristics, as to be liable to produce more harm than good. All that I would wish to say is, that the German scholastic system, whether as regards their colleges or their schools, is an admirable one for Germany. The professors undoubtedly rank amongst the most deeply learned men of the age, and their scholars are as thoroughly instructed as any, and I believe more extensively so than any, in Europe. Indeed, the fault which I have generally heard alleged against the German academies, and to which, from my own experience, I should think them most liable, is, that of making their pupils too learned; so that those, whom we should call their "crack men," are usually mere pedants, with heads stuffed full of all kinds of knowledge, but with minds utterly uneducated. This is a fault, however, which I suspect is to be attributed as much to the peculiar character of the German mind as to the nature of the

German schools; and, after all, is it a fault from which our own university education is entirely free? Do not our own Universities turn out men as learnedly ignorant as Heidelberg and Berlin?—men who can scan the most difficult choruses in the tragedians, and think no more of the most difficult questions in mathematics than I do of the recondite problem of the snail, and yet who do not know a hawk from a barnshaw. There is, however, one practice common to all the German schools, which might, I think, be introduced amongst us with advantage; I mean, the habit of *speaking* Latin. In the upper classes of the Gymnasias, or public schools, it is usual to enforce the speaking of Latin amongst the scholars, as is frequently the case in our academies with regard to French. This practice imparts a greater readiness and command over the language than can be gained by any of our systems of laborious written exercises. And thus you shall frequently find students in Germany who can converse with each other in Latin for hours together on colloquial subjects with the most perfect ease. Indeed, the thing is sometimes carried a little too far. I remember a case of a man at Bonn, who had the most perfect command of the Latin tongue, and could chatter college slang in it as easily as in German, but the accomplishment was attended by one disadvantage, which made it not a little inconvenient; for whenever the Latinist got drunk, which, unfortunately, was not seldom, he invariably retreated to bed, and remained there until he was perfectly sober again; but though this, of course, took a long time, and he was extremely troublesome on such occasions, continually summoning and ordering about the servants, he never would use any other language but Latin, and was excessively angry when his commands were misunderstood, or that his unfortunate landlady, in sheer self-defence, was constrained at such times to send for some fellow-student to act as interpreter.

(To be continued.)

A CHRISTMAS PARTY IN THE COUNTRY.

CHAP. III.

AFTER dinner, the *Hortus siccus* was produced, and the *Adiantum capella Veneris* shown to Justine, who was anxious to know the derivation of the name, since she traced no resemblance to hair in the leaves.

"I believe," said Sophia, "that it is to be traced in the leaf-stalks rather than in the leaves themselves, and these you will find to be fine and hair-like. Indeed, a resemblance there must be, for it is in German and Dutch called *Venus-haar*, which answers to the Latin *Capella Veneris*, and to the English Maiden-hair. *Adiantum*, the other botanical name, is derived from a Greek word signifying 'dry'; and it is said, that if you plunge the plant into water, it will, on coming out, reject all the moisture, and quickly be as dry as before. It is the very prettiest of all our British ferns, and yet they are all pretty."

"What sort of flowers have they?"

"They have not any flowers; their beauty consists in the elegance and variety of their foliage, which adorns the wild heaths and woods; and one might almost fancy some of them to form fairy forests, and picture the tiny elves frisking beneath their shade."

"Why, Sophia," cried Charles, "you must gather fern-seed; and then, indeed, you may have a chance of seeing the 'good people,' who would not otherwise allow your presence at their revels."

"Perhaps the fairies do gather it," said Lucy; "and that may be the reason that we never see them."

"What do you mean by gathering fern-seed?" asked Justine.

"Oh! it is an old superstition in the north, that if you can obtain possession of fern-seed, you may render yourself invisible."

"I do not suppose," said Mrs. Loraine, "that this superstition has arisen from the fact that ferns do not flower, and consequently have not what in strictness can be called a seed; for they do propagate themselves by what is somewhat analogous to seeds, and our unscientific ancestors would hardly quibble at a word. They must have intended to insinuate the fact, that these *sori*, as they are now called, are so minute and so hidden as to be extremely difficult to be found. They are usually placed under the leaf; frequently along the rib; or, as in the Maiden-hair, at the very edge; whilst, as a further concealment, some of them actually turn down the edges of the leaves, and cover the *sori* completely."

"Sophia," said Cyril, "I have been thinking of your fancy of the fairies disporting under the shade of waving ferns, and enlarging the said ferns in my mind's eye, until I found myself under the towering foliage I left behind me in India. I suppose you will not tell me that our splendid palm trees are of the same family as your elegant ferns."

"They certainly have much resemblance in form, but cannot be of the same family, since the palms have both flower and fruit, which the ferns have not; but you have also in the tropics tree-ferns of a gigantic size. Travellers, you know, tell strange stories; and, if I remember rightly, some have described the stems of these tree-ferns as rising to the height of forty or fifty feet without a leaf. In short, they are said to be most superb objects, emulating the palm in size as well as in elegance."

"Those tropical ferns," said Mr. Barlow, "are a great support to the theory of geologists, that our globe must formerly have been a great deal hotter than at the present day, since, amongst the fossil remains in this latitude, numberless ferns are discovered, greatly resembling the present species of that plant, but of so enormous a size, that some of them could not have been less than thirty feet in height, whilst the ferns in the same latitude now seldom reach to the height of more than three feet."

"I know nothing," said Mr. Loraine, "more interesting to the mind than the opening of the study of geology. We seem to be gazing into the long receding vista of time, where gigantic masses arise on every side, hidden by thick clouds, through which we can only occasionally discern with certainty the sublime objects concealed by their drapery."

"I can quite enter into your ideas," said Mr. Barlow, "and can only compare the feeling to what we may suppose Belzoni to have experienced as he penetrated into the wonderful temples of the Nile, and saw beauty, order, and magnificence unfolded before him. Yet we have in geology a more noble pursuit than this, since our object is not to explore the works of man, but of God, in whose works we are sure to find order, the most wonderful, even where there is a seeming chaos; for 'He hath measured the waters in the hollow of His hand, and meted out heaven with the span: and comprehended the dust of the earth in a measure, and weighed the mountains in scales, and the hills in a balance.'"

"How much it is to be regretted," said Mrs. Loraine, "that in some minds there is raised a prejudice against the study of geology, from a supposition that it leads to theories subversive of the truth of the Mosaic account of the creation!"

"It is indeed a cause of regret," replied her husband; "but the greater regret should be, that men, reasoning from parts alone, should have allowed themselves to build theories, which, I feel convinced, the farther progress of geological knowledge will disprove; but there are, fortunately, many learned and scientific men, who are ready to submit their great talents to the superior light of revelation, and we know that 'truth is mighty and will prevail.' Firmly believing the truth as re-

vealed in the Bible, I am so far from wishing to repress the study of geology, that I would encourage it to elicit fact after fact, convinced that, in the end, every seeming difficulty will be overcome, and science and revelation speak the same language. Already there is one striking coincidence to be found between them."

"What is that, my dear father?"

"Why, Lucy, your lectures on geology at R—— last summer have been thrown away upon you, if you do not recollect that, for the convenience of arrangement, geologists have divided the strata of the globe into three series."

"Oh," interrupted Agnes, "even I remember primary, secondary, and tertiary! for I always think of old John Brown, who had the tertian ague, which came on every three days."

"Your memory contrives to jumble matters strangely, Agnes," said her father; "but your names of the three classes are certainly correct. In the earliest strata no fossil remains are found; as we advance upwards in the secondary series, plants appear, but no organized beings; still rising, fishes and reptiles are found mingled with the plants; whilst in the upper, or tertiary series, the bones of quadrupeds are discovered in abundance, and frequently in a fine state of preservation. Now, turn to the first chapter of Genesis, and you will find that Moses tells us, that on the third day of the creation God caused the earth to bring forth grass, and herbs, and trees; on the fifth day, He commanded the waters to bring forth abundantly the moving creatures that have life; and not until the sixth day did He create the beasts of the earth after their kind."

"It is indeed striking," said Lucy, "and may surely account for the much greater number of fossil plants than of fossil animals; as well as the chemical supposition, that their preponderance is caused by their more enduring nature, though that is of great account."

"I remember," said Rosaline, "being much struck by the fact that my favourite flowers, those frail and fleeting beauties, should outlast the more noble and animated parts of creation, and retain their elegance of form throughout unnumbered ages. A fossil flower!—what a strange association of duration and fragility!"

"And I dare say, Rose, you do not quite forget that, when you made the remark, James Hamilton said it added one more trait to the resemblance between women and flowers, since there is a preserving power in woman's affection, which renders her graceful even when the bloom of beauty is departed."

"There is no preservative of beauty like affection," said aunt Martha; "when it looks out from the countenance, it leaves its own image impressed there, and when its eye rests on the features of those it loves, it possesses a transmuting power more valuable than the fabled touch of Midas. We have often laughed at little Mennie Markham calling her very plain uncle, 'pitty uncle Guy;' yet the old man was gifted with the poetry of affection."

"You speak of the fossil remains of plants being very numerous; pray, have geologists been able to distinguish them botanically?" asked Frederic.

"Yes," said Mr. Barlow, "they have already classed about 640 distinct varieties, and most of them are analogous to the fern tribes."

"Five hundred and forty!" exclaimed Justine; "they must almost be as numerous as the living flowers of the earth."

"Not quite," said Sophia, "since botanists have described upwards of 50,000 of the latter, and the number is daily increasing by the discovery of new plants in recently explored regions."

"I certainly had no conception of this enormous number of plants, and could almost ask where room is to be found for them all."

"My dear girl," said Mrs. Loraine; "your ideas have been formed in trim gardens, where every plant is separately placed, and you have not considered that intri-

cate carpet-work which God has spread under our feet, or that exquisitely-varied drapery of every hue with which He has clothed the fair scenes of nature. We must take you to spend a summer's day in Clevedon-Dean or on Halston Moor, before we can display to you half our treasures."

"Oh! Justine," cried Agnes, "how I do wish you had been with us last summer, when we went on to Halston Moor! Sophia, and Lucy, and Alice Forster, and I, rode by turns on the old pony; and Charles, and Alwyn, and dear Edmund, walked by us. Charlotte Forster and mamma drove to Halston Farm to make tea for us. They came by the road, but we went by the moor the whole way—oh, it was delightful!"

"We certainly had a day of great enjoyment," said Sophia. "The sky above us was perfectly clear; and though the sun shone a little fiercely, he is generally so capricious a guest during our summers that we would not complain, whilst the little difficulties of the road only stimulated us to increased merriment."

"I can hardly fancy a moor very pretty or picturesque," said Justine, "but perhaps Halston Moor is an exception."

"I do not suppose it is," replied Sophia. "It is just such a common as may be found in many other parts of England; of no great extent, and of no peculiarity, if we except, perhaps, a few large oaks which are scattered here and there, and are fine objects for a sketcher. The enjoyment was in the pure air and active exercise, and in the search after rare wild flowers, in which we all busily engaged."

"And does a bare moor yield many?"

"You must not call a moor bare; for, as mamma says, it is spread with an intricate carpet-work of flowers. Even the most common flower there, the whin-bush, is so beautiful, that the German botanist, Dillenius, when he first beheld this glory of an English common spreading its golden blossoms to the winds, and loading them with its most rich perfume, actually went down on his knees in admiration of the wonderful plant."

"Is it then so very splendid?"

"Surely you know a whin-bush, Justine," exclaimed Agnes.

"Perhaps," said Mrs. Loraine, "you may know it by the name of gorse."

"Oh," said Frederic, "I have certainly heard of and seen gorse covers in Leicestershire, though I never was properly introduced to one. Come, Lucy, you have all the crabbéd names by heart—tell us by what hard name to call this splendid plant!"

"I shall begin to suspect, Frederic, that you are rather more knowing than you profess to be, and wish to puzzle me, since, though I can tell you that the botanical name of the whin is *Ulex Europæus*, I must add that I am quite ignorant of the derivation of this word, as also of that of the English names. The only guess I can remember is that of some learned antiquary, who thought it might by possibility have come from a Celtic word, *uc*, which signifies a point; and surely it has prickly points enough about it."

"Dash knows that, I should think," said Agnes. "Do you not remember, when he was so eagerly pursuing a rabbit, he ran his nose quite amongst the bushes, and came back making such a foolish appearance that we all laughed at him? and then he had disturbed a lark, who sprang up into the air, and warbled a song so loud, we heard it above our laughter, and all became suddenly silent, raising our heads as quickly as Dash had done, and gazing up after her until the song became fainter and fainter, and she was only like a little wee tiny speck in the clear blue sky. I was so busy lark-gazing that I put my foot quite into a boggy place, and when I screamed out I frightened poor old Nora, and Alice, who was riding her, had nearly been thrown by her starting. Then, soon after, we came to the gipsy camp under the large oak, which we call the Druid's oak."

"I have just been fetching Lucy's charming sketch,"

interposed Rosaline, "that I may show it to Mrs. Barlow and my cousins, and prove that I had my share of the day's enjoyments; though I was too ill to join the party. Is it not clever? Do look at that little black-eyed urchin, sitting up in bed under that tent, and peeping out upon the strangers, whilst the rough little terrier round which he has thrown his arm, seems equally curious to commence an acquaintance with Dash. They are as well contrasted as Burns's 'Twa Dogs.'"

"And then, Mrs. Barlow," asked Agnes, "is not that like Edmund? Oh, how he tried to puzzle the old grandmother with his sea phrases!—and those crossed sticks over the fire, from which the pot was hanging to boil!—and all those blue, red, and yellow rags which the women were washing in the ditch, and hanging on the gorse to dry!—oh, it is all so like!"

"I fear the prickly whins would tear the rags still more."

"Oh, no! those lean black sheep crop them so closely, as far as they can reach, that they are in some places quite like smooth green hillocks on the outside. As we remarked this, Alice Forster said she had seen fences of whins near Melrose, which were not gay with flowers; they were cut too closely for that, but they made a very showy hedge. The old woman heard this, and told her she came from that part of the country, and had a house at Kirk Yetholm. Only think,—at Kirk Yetholm, where Walter Scott's Meg Merrilies was born! I call that old woman our Meg Merrilies."

"I prize my sketch very much," said Rose; "it always reminds me of Cowper's description:

'I see a column of slow rising smoke
O'er top the lofty wood that skirts the wild.
A vagabond and useless tribe there eat
Their miserable meal. A kettle slung
Between two poles upon a stick transverse
Receives the morsel:—

and a little before this description, he says:

'The common, overgrown with fern, and rough
With prickly gorse, blunt, shapeless and deform'd,
And dangerous to the touch, has yet its bloom,
And decks itself with ornaments of gold,
Yields no unpleasing ramble; there the turf
Smells fresh, and, rich in odorous herbs
And fungous fruits of earth, regales the sense
With luxury of unexpected sweets."

"I cannot quite forgive Cowper," said Sophia, "for calling the gorse 'shapeless and deformed,' or for omitting to notice its most delicious fragrance, which we may perceive stealing over us on the soft still air of a hot summer's day, even before we come upon the glowing masses which, at such a time, seem alive with the multitude of bees hovering over them, and adding the charm of their low musical sound to those of sight and smell. Certainly, the whin bush deserves more respect. In Petersburg they actually cherish it as a valuable hot-house plant."

"Well, to judge from your description," said Justine, "a day on Halston Moor must be as delightful as a fête at the Chiswick gardens, and certainly produced at much less expense in every way,—less time, less money, and less temper."

"Scarcely less time, since our expedition occupies the whole day."

"But then, your enjoyment begins with the day, whilst we lose hours in driving, or rather crawling in a carriage through crowded streets and dusty roads, before we reach the entrance of the gardens, where more time is wasted in cranking through the assembled multitude. Then, besides the expense of the ticket, there is the expense of the toilet; and then the temper! O, how provoking it is to have a lovely new dress torn to pieces, or a bonnet spoiled by a shower! and it always rains on a Chiswick fine day. Last year, I had a most beautiful organdie dress, direct from Paris, and—was it not provoking!—Mr. Mostyn was just about to offer me his

arm, when Fanny Harwood tied upon it. The crowd pushed me on—I lost my escort, and had my dress torn across, so that I never could wear it again. I half fancied Fanny did it on purpose, and I was very, very angry."

"So was I, Justine, when Edmund caught my pink gingham frock with the end of the whip, for I had it to mend the next morning. It was better than your dress, for it could be mended; yet you had the advantage of seeing all the superb flowers," said Agnes.

"But, Justine, in enumerating the delights of Chiswick, you forget the refreshments; all the ice-cream which fell upon old Mrs. Orton's blue velvet. You do not find champagne and ices in festooned marquees on Halston Moor, I suppose," said Frederic.

"No, no, but we had a very nice basket of prog, and a charming place for eating our cold pie, and drinking cider. Not under a single tree, but under a cluster of oaks, which Alleyn was so classical as to name the Grove of Dodona."

"And a very pretty name too, Miss Sophia, and there was, at least, a stock-dove in the branches, to give its oracles, and a stream to add to the resemblance; not very pleasant water, I must own, from flowing through the moss, and certainly, not always full at midnight and dry at noon."

"I quite approve of Alleyn's classical reminiscences," said his father, "and do not always agree with Shakspeare's much quoted, 'What's in a name' (for there is often much in a name to recal what is beautiful. Perhaps Sophia will remember those lines of a German poet, who deserves to be named in the same sentence with his loved Shakspeare, in which he beautifully describes the influence which the Grecian fables still have on educated minds, although 'they live no longer in the faith of reason.'"

"You mean those lines from Schiller's Wallenstein:

'For fable is love's home, his birthplace:
Delightedly dwells he 'mong fays, and talismans,
And spirits, and delightedly believes
Divinities, being himself divine.
The intelligible forms of ancient poets,
The fair humanities of old religion,
The power, the beauty, and the majesty,
That had their haunts in dale, or piny mountain,
Or forest, by slow stream, or pebbly spring,
Or chasms and watery depths; all these have vanished,
They live no longer in the faith of reason!
But still the heart doth need a language, still
Doth the old instinct bring back the old names."

"In honour of those beautiful lines," said Mrs. Lorraine, "pray let the name be adopted; but let me remind you that there is a religious solemnity in the overshadowing of fine trees, which may bring holier recollections. Trees are frequently mentioned in the Bible as memorable in the history of the patriarchs and prophets, during the earliest ages of the world; though I do not at this moment remember any such recollection attached to the oak, except in that awful account of the Man of God, who was disobedient unto the word of the Lord, and whom the old prophet found seated under an oak. Tempted by its shade to linger on his way homeward, by yielding to that temptation he prepared himself to fall by another, and to return by the way that he came, in direct opposition to God's commandment!"

"There is," said aunt Martha, "a passage in Isaiah, in which God, after pronouncing judgment upon Judea, and predicting the desolation of the land, says, 'But yet in it shall be a tenth, and it shall return and shall be eaten: as a tall-tree and as an oak, whose substance is in them when they cast their leaves, so the holy seed shall be the substance thereof.' In this passage, how noble is the figure of the oak, which has lost indeed its summer ornaments, but still standing firm in the vigour of its vitality! I sometimes contemplate this same image as a fit emblem of our holy Church, should its enemies ever succeed in their endeavours against it."

Then, indeed, it may be stripped of the trappings of its prosperity, which have their use as well as their beauty; but still, its substance will be in it, for the Holy Spirit is the substance thereof; and in the wintry storms of adversity, like the oak, it will become the more firmly rooted, for its foundations are upon the holy hills, and its top reaches to the heavens; aye, and we may confidently rejoice in its strength, and look that it shall flourish again, and that the nations shall return to shelter beneath its boughs!"

"The oak is a noble tree, and that cluster of oaks was certainly very fine," said Charles, "and I must allow it fit to inspire poetical recollections. Even Agnes took to quoting there, for she nestled down under a clump of bracken, and tried to sing

'The heath this night must be my bed,
The bracken curtain for my head.'

"What is bracken?"

"Oh! the bracken is the common fern, Justine, and if you had been there, in that very spot, you might well have wondered at the multitude of flowers. I counted twenty within reach of my hand, where I was seated, and I took out a pencil, and made a list of them, that I might not forget any. There was the bracken, the heath, or erica tetralix; the lalluna, or ling; the lovely little anagallis tenella, or bog pimpernel; the polygala, or milk wort, both blue and white; the euphrasia, or eyebright; the pinguicula, or butterwort; the little linum catharticum, or purging flax; the drosera, or sundew; three or four kinds of mosses; two hypericums, or St. John's worts; the veronica, or speedwell; the parnassia—"

"Agnes! Agnes!" interrupted Frederic, "you will break all your teeth by repeating so many hard names, and yet I suppose Sophia will make them all out to be poetical."

"Very nearly all, I dare say," replied Sophia. "The heath has undoubted claims, as all Scottish bards will testify; and the little anagallis tenella is one of the most lovely and delicate of the British Flora, as its name, you Latinists will know, implies. Anagallis, too, signifies laughter, and alludes to the medicinal properties of some of the species, which were formerly supposed to cheer the spirits, by removing obstructions of the liver. Anagallis arvensis is a merry looking little flower, which may be seen at the skirts of a corn-field, opening its bright red petals to the sun, but closing them again whenever a cloud interposes between it and the ray it loves: and thus giving warning of the approach of rain, it has acquired the rustic title of the Shepherd's Weatherglass. Surely, that is poetical?"

"It is pretty," said Rosaline, "but must yield the palm of poetical merit to the Parnassia, or Grass of Parnassus, said to have derived its name from its grace and beauty, which well entitle it to claim Parnassus as its birth-place. Sophia has scarcely been able to do it justice in her drawing, for it is every way worthy of a place in the Grove of Dodona."

"Pray, Rose, do not insinuate that the Grove of Dodona was near Mount Parnassus, since the one was in Epirus and the other in Phocis."

"Alley, you are too learned by half. I fear Justine may be already tired of our derivations from the Greek, though we only give them botanically."

"Indeed, I begin to take a great interest in these names," said Justine, "since I find they have so much meaning. Pray what is the derivation of Pinguicula, or Butterwort?"

"You have not made a happy hit, Justine," laughed Charles, "if you intend Sophia to make anything poetical out of Butterwort. Wort is an old Saxon word for plant, and Butter has a very greasy sound, whilst Pinguicula unfortunately also means fat. Butterwort is a fat, greasy plant; is it not, Sophia?"

"Its leaves have a very unctuous appearance, certainly, and from this it has derived its name, which is

not very inviting; but the flower is extremely pretty, looking at a little distance like a violet robbed of its modest covering, and exposed to the rude gaze of every passer by. But after all, butter is very rural, and the plant has in Norway a rustic celebrity, being there used for the purpose of thickening milk, and forming a very grateful sort of curd. I wish I could say more for it, but my father will not let me quote 'What's in a name?' so I will leave it, and defy you to find fault with that of Sundew, whose rose-coloured leaves each secrete a single globule of clear, pellucid liquor, resembling dew, which glistens in the rays of the noonday sun, when real dew is all absorbed by the heat. It is a complete contrast to the Maiden-hair, the one rejecting all moisture, and the other always retaining it."

"Well, but what does Drosera mean?"

"That word is also derived from a Greek word, signifying dew, and it seems to have a similar appellation wherever it is known; being the Sonnentau of the Germans, and the Rugiada del Sole and Rociade of the Italians and Spaniards; besides which, it gives a name to the elegant Italian liqueur Rosolio, as it enters into its composition, and is said to possess many stimulating qualities."

"It is a very curious as well as a very beautiful plant," added Lucy; "for the hairs which support the globules of dew are so irritable, that should an unhappy insect settle upon them, they immediately close over it and crush the poor victim to death."

"What an hypocritical monster," cried Cyril, "weeping its dewy tears over those sacrificed by its own cruelty!"

"Not one word against so great a favourite, if you please. It has no rival in Agnes's list, but the Euphrasia."

"And what have you to say in favour of the Euphrasia?"

"More than I shall have time to advance to-night; for mamma has been turning over our Laureat's budget, and I see has selected an appropriate charade."

"If I guess rightly, it will prove very appropriate," said Mrs. Lorraine, and handed to Sophia the following:

Hail to my first, as he marches forth
With his saffron banners gay;
Spreading his conquest o'er south and north,
He takes his wondrous way.
Brightly my second her tearful eyes
Uplifts, her lord to greet;
If he smile, to his loved embrace she flies,
And dies 'neath his kisses sweet.
Whilst my lowly whole finds her humble rest
On some lone moorland hill,
And the plover's couch is her velvet breast,
Where he nestles close and still.

SIR F. HEAD'S EMIGRANT.¹

We venture to say that few who have taken up this volume to read, after having drawn on their gloves lest a spot should stain the purity of its milk-white covers, and admired the woodcuts on each board, suggestive of the toils and hardships of emigrant life, have not felt that they have been in some slight degree taken in by its title and appearance. We are far from saying that it is a worse book than one would have a right from these to expect; but it is certainly not the kind of book we should have anticipated from such outward characteristics. It says but little on the subject of emigrants or emigration, and has no other right to its title than that it is a book written about a country to which many men do emigrate. And it has far other stuff in it than we should expect to find where its delicate clothing will

(1) The Emigrant, by Sir Francis B. Head, Bart. London: Murray, 1846.

naturally place it—in a lady's boudoir, or on a drawing-room table. The book is, in fact, a smart political pamphlet, full of hard hits, directed with laudable impartiality against all, of whatever party, who have taken a different view of the policy to be adopted towards our North American colonies from the author, and written with the off-hand dashing vivacity of style and manner characteristic of all his sayings and doings.

Had there been nothing in the book but politics, with whatever interest we might have read it, we should not have felt it right to make it the subject of remark in this Magazine. But a portion—we will venture to say not the least interesting portion—of the book is taken up with observations and sketches of a more general character, which will be read with much pleasure by persons of all opinions, not even excepting the two *ames damnées* of Sir F. Head's political creed, Lord John Russell and Sir Robert Peel. The author himself compares his book to a crow (if it be, it is a white one), which is made up of a small lump of carrion, and two or three handfuls of feathers; so, he says, is this volume composed of political history, buoyed up by a few light sketches solely written to make a dull subject fly. We should rather have compared it to an arrow pointed with steel and winged with peacock's feathers.

Most of our readers will recollect that Sir Francis Head, or as he tells us the Americans love to call him, with an enormous quantity of superabundant emphasis on the additional word, Sir Francis *Bond* Head, was governor of Upper Canada during the insurrection in 1838, which forms the subject of a considerable portion of his book. But, before coming to it, we have some sketches of a more general kind, some of which we shall extract. The following is an attempt to account for the difference of temperature in Europe and America at corresponding degrees of latitude, with an account of the causes which are operating to effect a change in that of the latter.

"It is well known that, so far as temperature is concerned, cold is increased by altitude, as it is by latitude; accordingly, that by ascending a steep mountain—the Himalayas for instance—one may obtain, with scarcely any alteration of latitude, and in a few hours, the same change of temperature which would require a long journey over the surface of the earth to reach; and thus it appears that in the hottest regions of the globe there exist impending stratifications of cold proportionate in intensity to their respective altitudes.

"Now, as soon as moisture or vapour enters these regions, in southern countries it is condensed into rain, and in the winter of northern ones it is frozen into snow, which, from its specific gravity, continues its feathery descent until it is deposited upon the surface of the ground, an emblem of the cold region from which it has proceeded.

"But from the mere showing of the case, it is evident that this snow is as much a stranger in the land on which it is reposing, as a Laplander is who lands at Lisbon, or as, in England, a pauper is who enters a parish in which he is not entitled to settlement; and, therefore, just as the parish officers, under the authority of the law, vigorously proceed to eject the pauper, so does nature proceed to eject the cold that has taken temporary possession of land to which it does not owe its birth; and the process of ejection is as follows:—

"The superincumbent atmosphere, warmed by the sun, melts the surface of the snow; and as soon as the former has taken to itself a portion of the cold, the wind, bringing with it a new atmosphere, repeats the operation; and thus on, until the mass of snow is either effectually ejected, or materially diminished.

"But while the combined action of sun and wind are producing this simple effect in the old world, there exists in the northern regions of the new world a physical obstruction to the operation. I allude to the interminable forest, through the boughs and branches of which the descending snow falls, until reaching the ground it remains hidden from the sun and protected from the wind; and thus every day's snow adds to the accumulation, until the whole region is converted into an almost boundless ice-house, from which there slowly but continually arises, like a mist from the ground, a stratum of cold air, which the north-west prevailing wind wafts over the south, and which freezes everything in its way.

"The effect of air passing over ice is curiously exemplified on the Atlantic, where, at certain periods of the year, all of a sudden, and often during the night, there suddenly comes over every passenger a cold mysterious chill, like the hand of death itself, caused by the vicinity of a floating iceberg. Now, it is curious to reflect that while every backwoodsman in America is occupying himself, as he thinks, solely for his own interest, in clearing his location, every tree which, falling under his axe, admits a patch of sunshine to the earth, in an infinitesimal degree softens and ameliorates the climate of the vast continent around him; and yet, as the portion of cleared land in North America, compared with that which remains uncleared, has been said scarcely to exceed that which the seams of a coat bear to the whole garment, it is evident, that although the assiduity of the Anglo-Saxon race has no doubt affected the climate of North America, the axe is too weak an instrument to produce any important change.

"But one of the most wonderful characteristics of Nature is the manner in which she, often unobservedly, produces great effects from causes so minute as to be almost invisible; and, accordingly, while the human race—so far as an alteration of climate is concerned—are labouring almost in vain in the regions in question, swarms of little flies, strange as it may sound, are, and for many years have been, most materially altering the climate of the great continent of North America.

"The manner in which they unconsciously perform this important duty is as follows:—They sting, bite, and torment the wild animals to such a degree, that, especially in summer, the poor creatures, like those in Abyssinia, described by Bruce, become almost in a state of distraction, and, to get rid of their assailants, wherever the forest happened to be on fire, they rushed to the smoke, instinctively knowing quite well that the flies would be unable to follow them *there*. The wily Indians, observing these movements, shrewdly perceived that by setting fire to the forest the flies would drive to him his game, instead of his being obliged to trail in search of it; and the experiment having proved eminently successful, the Indians for many years have been, and still are, in the habit of burning tracts of wood so immense, that, from very high and scientific authority, I have been informed that the amount of land thus burned under the influence of the flies has exceeded many millions of acres, and that it has been, and still is, materially changing the climate of North America."

There is a very interesting chapter on the various causes which have led to emigration to Canada, and on the manner in which the natural characteristics of the Anglo-Saxon race, combined with the peculiar circumstances in which emigrants to Canada are placed, have operated in producing those distinguishing features of character by which the people of that country are now marked.

"It is wonderful to observe how admirably Nature has parcelled out to the different nations of mankind the cultivation of those territories which are best suited to their respective characters and physical strength. For instance, the indolent inhabitants of old Spain and Portugal were led apparently by blind chance to

discover in the new world plains of vast extent situated in a genial climate, which, without any culture, were fitted for the breeding of almost every animal which forms the food of man. On the other hand, by the same mariner's compass, the Anglo-Saxon race were conducted to a region visited by intense cold, and covered with trees of such enormous size, that emigration to this country has justly been termed '*War with the wilderness*;' and certainly any man who has experienced in it the amount of fatigue to be endured in cutting down a single tree, in ploughing among its roots, and in sowing and reaping around its stump, must feel that it required a strong, healthy, hardy race of men to clear a country in which the settler has, as it were, to engage himself in a duel with each and every individual tree of the interminable forest that surrounds him.

"But on the discovery of America, Nature not only led the British to the battle-ground I have described, but by instinctive feeling she has since conducted, and continues to conduct to it, the individuals of our country best suited to the task. It would be incorrect to state that the many thousands of emigrants that have annually sailed for our North American provinces have been particularly athletic; but, as the French army truly say, '*C'est le cœur qui fait le grenadier*,' so it may accurately be stated that, with a few exceptions, they must have been persons of rather more enterprising disposition than their comrades whom they left at home; indeed, when I have reflected on the expense, anxiety, and uncertainty attendant upon emigrating to a new world, I have often felt astonished that labourers, tethered to their parish by so many ties and prejudices, should ever have summoned courage enough to make up their minds to sail with their families in a ship for countries in which, to say the least, they must land ignorant, friendless, and unknown. Propelled by these motley reasons, feelings, grievances, and doctrines, many thousands of families and individuals of various grades (in 1842 their number exceeded 42,000), have annually taken leave of the shores of Great Britain, to seek refuge in the splendid wilderness of Canada—or in other words, sick of vain pomp and glory, have left the old world for what they hoped would be a better.

"Now, just as seafaring men declare, that after Thames soup has undergone fermentation, during which process it emits from the bung-hole of the casks which contain it a gas highly offensive, and even inflammable, it becomes the clearest, the sweetest, and most wholesome water that can be taken to sea; so does the same sort of clarification, and the same results, take place in the moral feelings of the crowds of emigrants I have described.

"For a short time, on their arrival at their various locations, they fancy, or rather really and truly feel, more or less strongly, that there is something very fine in the theory of having apparently got rid of all the musty materials of '*Church and State*;' and travelling in this sentiment, they for a short time enjoy the novel luxury of being able to dress as they like, do as they like, go where they like. They appreciate the happiness of living in a land in which the old country's servile custom of touching the hat does not exist—in which every carter and waggoner rides instead of walks, and in which there are no purse-proud millionaires—no dukes, duchesses, lords, ladies, parsons, parish officers, beadles, poor-law commissioners, or paupers—no tithes, and no taxes.

"But after the mind, like the Thames water, has continued for a sufficient time in this state of pleasing fermentation, the feelings I have just described begin gradually to subside. Some fly away, and some crawl away; some evaporate, and some sink; until the judgment, his best friend, clearly points out to the emigrant that, after all, '*liberty and equality*,' like many other resplendent substances, contain in their compositions a considerable quantity of alloy.

"One of the first wants, like a flower in the wilderness, that springs up the mind of a backwoodman, is to

attend, occasionally, a place of worship. Solitude has first slightly introduced, and has then welcomed to his mind more serious reflections than any it had previously entertained. The thunder and the lightning of heaven, the sudden storms, the intense folds, the magnificent colouring of the sky, the buoyant air, the gorgeous sunsets, one after another, have sometimes sternly, and sometimes smilingly, imparted to him truths which have gradually explained to him that there is something very fearful, as well as fallacious, in the idea of any human being boasting to himself of being independent of that Power so eminently conspicuous in the wilderness of America.

"As soon as this want has taken firm root in the heart, it soon produces its natural fruit. The emigrants meet, consult, arrange with each other, subscribe, according to their means, a few dollars, a few pounds, or a few hundred pounds, (one of the most powerful axemen in Upper Canada expended on this object upwards of a thousand pounds;) the simple edifice rapidly grows up, is roofed in, is furnished with benches, until at last, on some bright Sabbath-day, a small bell, fixed within a little turret on its summit, is heard slowly tolling in the forest. From various directions sleighs and waggons, each laden with at least one man, a woman or two, and some little children, are seen converging towards it; and it would be impossible to describe the overwhelming feelings of the various members of the congregation of both sexes, of all ages, when their selected and respected minister, clad in a decent white surplice, for the first time opens his lips to pronounce to them the well-known words, which declare that when the wicked man turneth away from the wickedness he hath committed, and doeth that which is lawful and right, he shall save his soul alive.

"The thunder and the hurricane have now lost all their terrors; the sunshine has suddenly become a source of legitimate enjoyment; the rude log hut an abode of happiness and contentment; and thus the emigrant every day more and more appreciates the blessing which is rewarding him for having erected in the wilderness his own established church.

"Among the various good feelings that subsequently vegetate in his mind is that of filial attachment to Old England. The banished heart first yearns for the crooked lanes, the green fields, and rosy cheeks which adorn the surface of the old country; and then, not satisfied with loving the land, it soon learns to love all who live in it. But while these British sentiments are growing, local politics first assail, and soon apparently entirely engross, the emigrant's attention. He has, perhaps, applied to be made a magistrate, and has seen his neighbour appointed instead; he has written to the governor for a patent for the land he is clearing, and has received no answer. His nearest neighbour and intimate friend is a reformer, who has told him that reform would very likely give him a road; would perhaps get him some appointment; would indemnify him, in some way, for the cow that died; in short, he understands, and firmly believes, that any change would do him good; and that even if it did not, at all events it would be a change; and so he is ready to vote for the man that is already promising to effect a change.

"Now, it is almost inconceivable how eagerly the backwoodman engages in local politics of this nature. Every angry word he utters inflames his own angry feelings. He disputes with one neighbour, and allies himself with another; and, as neither the one nor the other, nor any of them, have any knowledge of what is really going on at the seat of government, except what they read in provincial newspapers, which are often of the vilest description, a murmur is created, which, by people of England, who do not understand emigrants' language, is supposed very clearly to threaten separation from the mother country! Whereas, the moment that question is undiagnosedly proposed, the whole fabric of local politics falls to the ground, party feelings are

forgotten, and from all directions the Irishman, and Scotchman, and Englishman, are seen worming their way through the trees, to join together, hand in hand, to maintain connexion with Old England, whom, it may truly be said, they love infinitely more dearly and more devotedly than do her own children at home."

The following little sketch, we are sure, will please our readers. It is a good story; all the better for the way in which it is told:—

THE EMIGRANT'S LARK.

"Henry Patterson and his wife Elizabeth sailed from the Tower in the year 1834, as emigrants on board a vessel heavily laden with passengers, and bound to Quebec. Patterson was an intimate friend of a noted bird-catcher in London called Charley Nash. Now, Nash had determined to make his friend a present of a good sky-lark, to take to Canada with him; but not having what he called 'a real good un' among his collection, he went into the country on purpose to trap one. In this effort he succeeded; but, when he returned to London, he found that his friend Patterson had embarked, and that the vessel had sailed a few hours before he reached the Tower stairs. He therefore jumped on board a steamer that was just starting, and overtook the ship just as she reached Gravesend, where he hired a small boat, and then sculling alongside, he was soon recognised by Patterson and his wife, who, with a crowd of other male and female emigrants of all ages were taking a last farewell of the various objects which the vessel was slowly passing.

"'Here's a bird for you, Harry,' said Nash to Patterson, as, standing up in the skiff, he took the frightened captive out of his hat, 'and if it sings as well in a cage as it did just now in the air, it will be the best you have ever heard.'

"Patterson, descending a few steps from the gangway, stretched out his hand and received the bird, which he immediately called Charley, in remembrance of his faithful friend Nash.

"In the Gulf of St. Lawrence the vessel was wrecked; almost everything was lost except the lives of the crew and passengers; and accordingly, when Patterson, with his wife hanging heavily on his arm, landed in Canada, he was destitute of everything he had owned on board, excepting Charley, whom he had preserved, and afterwards kept for three days in the foot of an old stocking.

"After some few sorrows, and after some little time, Patterson settled himself at Toronto, in the lower part of a small house in King Street, the principal thoroughfare of the town, where he worked as a shoemaker. His shop had a southern aspect; he drove a nail into the outside of his window; and regularly every morning, just before he sat upon his stool to commence his daily work, he carefully hung upon this nail a common sky-lark's cage, which had a solid back of dark wood, with a bow or small wire orchestra in front, upon the bottom of which there was to be seen, whenever it could be procured, a fresh sod of green turf.

"As Charley's wings were of no use to him in this prison, the only wholesome exercise he could take was by hopping on and off his little stage; and this sometimes he would continue to do most cheerfully for hours, stopping only occasionally to dip his bill into a small square tin box of water, suspended on one side, and then to raise it for a second or two towards the sky. As soon, however, as, and only when, his spirit moved him, this feathered captive again hopped upon his stage, and there, standing on a bit of British soil, with his little neck extended, his small head slightly turned, his drooping wings gently fluttering, his bright black eyes intently fixed upon the distant, deep, dark blue Canada sky, he commenced his unpremeditated morning song, his extempore matin prayer.

"The effect of his thrilling notes, of his shrill joyous song, of his pure unadulterated English voice, upon the

people of Canada, cannot be described, and probably can only be imagined by those who, either by adversity have been prematurely weaned from their mother-country, or who, from long-continued absence from it, and from hope deferred, have learned in a foreign land to appreciate the inestimable blessings of their fatherland, of their parent home. All sorts of men—riding, driving, walking, propelled by urgent business, or sauntering for appetite or amusement—as if by word of command, stopped, spell-bound, to listen, for more or less time, to the inspired warbling, to the joyful hallelujahs, of a common, homely-dressed, English lark! The loyal listened to him with the veneration with which they would have listened to the voice of their sovereign: reformers, as they leaned towards him, heard nothing in his enchanting melody which even they could desire to improve. I believe that in the hearts of the most obdurate radicals he reanimated feelings of youthful attachment to their mother-country; and that even the trading Yankee, in whose country birds of the most gorgeous plumage snuffe rather than sing, must have acknowledged that the heaven-born talent of this little bird unaccountably warmed the Anglo-Saxon blood that flowed in his veins. Nevertheless, whatever others may have felt, I must own that, although I always refrained from joining Charley's motley audience, yet, while he was singing, I never rode by him without acknowledging, as he stood with his outstretched neck looking to heaven, that he was (at all events, for his size) the most powerful advocate of Church and State in Her Majesty's dominions; and that his eloquence was as strongly appreciated by others, Patterson received many convincing proofs.

"Three times, as he sat beneath the cage, proud as Lucifer, yet hammering away at a shoe-sole lying in purgatory on his lapstone, and then, with a waxed thread in each hand, suddenly extending his elbows, like a scaramouch,—three times was he interrupted in his work by people who each separately offered him one hundred dollars for his lark; an old farmer repeatedly offered him a hundred acres of land for him; and a poor Sussex carter, who had imprudently stopped to hear him sing, was so completely overwhelmed with affection and *maladie du pays*, that, walking into the shop, he offered for him all he possessed in the world—his horse and cart; but Patterson would sell him to no one.

"On the evening of the —th of October, 1837, the shutters of Patterson's shop windows were half closed, on account of his having that morning been accidentally shot dead on the island opposite the city. The widow's prospects were thus suddenly ruined, her hopes blasted, her goods sold, and I need hardly say that I made myself the owner, the lord and the master, of poor Patterson's lark.

"It was my earnest desire, if possible, to better his condition, and I certainly felt very proud to possess him; but somehow or other this 'Charley is my darling' sort of feeling evidently was not reciprocal. Whether it was that, in the conservatory of Government House at Toronto, Charley missed the sky—whether it was that he disliked the movement, or rather want of movement, in my elbows—or whether, from some mysterious feeling, some strange fancy or misgiving, the chamber of his little mind was hung with black, I can only say, that during the three months he remained in my service I could never induce him to open his mouth, and that up to the last hour of my departure he would nevering to me.

"On leaving Canada, I gave him to Daniel Orris, an honest, faithful, loyal friend, who had accompanied me to the province. His station in life was about equal to that of poor Patterson; and accordingly, so soon as the bird was hung by him on the outside of his humble dwelling, he began to sing again as exquisitely as ever. He continued to do so all through Sir George Arthur's administration. He sang all the time Lord Durham was at work; he sang after the Legislative Council, the

Executive Council, the House of Assembly of the province, had ceased for ever to exist; he sang all the while the Imperial Parliament were framing and agreeing to an Act by which even the name of Upper Canada was to cease to exist; and then, feeling that the voice of an English lark could no longer be of any service to that noble portion of her Majesty's dominions—he died!

"Orris sent me his skin, his skull, and his legs. I took them to the very best artist in London—the gentleman who stuffs for the British Museum—who told me, to my great joy, that these remains were perfectly uninjured. After listening with great professional interest to the case, he promised me that he would exert his utmost talent; and in about a month Charley returned to me with unruined plumage, standing again on the little orchestra of his cage, with his mouth open, looking upwards—in short, in the attitude of singing, just as I have described him.

"I have had the whole covered with a large glass case, and upon the dark wooden back of the cage there is pasted a piece of white paper, upon which I have written the following words:

THIS LARK,
TAKEN TO CANADA BY A POOR EMIGRANT,
WAS SHIPWRECKED IN THE ST. LAWRENCE,
AND AFTER SINGING AT TORONTO FOR NINE YEARS,
DIED THERE ON THE 14TH OF MARCH, 1843,
UNIVERSALLY REGRETTED.
Home! Home! Sweet Home!"

POPULAR YEAR BOOK.

December 15.—ISAAC WALTON, a name dear to Englishmen, deceased on this day, 1683. He was born at Stafford, on the 8th of August, 1593. Nothing is known of his early life, but it is presumed that he was apprenticed to a relation of the same name who dwelt in Whitechapel, and is described as a hosier. Soon after the age of twenty he engaged in business on his own account, and dwelt on the north side of Fleet-street, in a house two doors west of Chancery-lane. Here he obtained the friendship of his vicar, Dr. Donne, (afterwards Dean of St. Paul's,) and several other eminent persons. In 1653 appeared his "Complete Angler, or Contemplative Man's Recreation," a work which has long been ranked among the most popular compositions in our language. At different intervals, he published his celebrated "Lives" of Donne, Hooker, Walton, and Sanderson, which are justly considered models of ecclesiastical biography.

December 16, is called "O Sapientia" in the English Ecclesiastical Kalendar. It is so named from the beginning of an anthem in the service of the western Church, which used to be sung in honour of CHRIST'S Advent from this day until Christmas Eve.

December 17.—We are told by Du Cange that it was anciently customary at this time for the "petty clerks" to assemble and choose an Abbat of Fools; upon whose election a *Te Deum* was sung, and then he was chaired upon the shoulders of his fellows, taken to the house where the rest were collected, and put in a place "especially ordered and prepared for this purpose." At his entrance all rose, (even the Lord Bishop if he were present,) and due reverence being paid him by his companions, fruit, spices, and wine were given him. The Abbat then began to sing in a ludicrous manner, while his associates endeavoured to drown his vocal efforts by bawling, hissing, howling, and clapping their hands. A short dialogue afterwards was followed by a sermon by the porter. The Abbat and others, followed by the younger canons, choristers, and Bishop's esquires, ran about the streets saluting every one whom they met. Sir S. R. Meyrick possesses a girdle reported to have been worn by an Abbat of Fools upon his entrance into office. It consists of thirty-five square pieces of wood, let into

each other, upon which are carved ludicrous and grotesque figures of fools, tumblers, huntmen, &c.

December 21.—Feast of St. Thomas.

This festival was instituted, A. D. 1180. It has been placed by the Church, says Brady, in the second course of holidays, beginning at Advent: our SAVIOUR having vouchsafed to afford St. Thomas the most indisputable evidence of His resurrection. Going a *gooding* (as it is called) on this day formerly prevailed in England. This seems to have been done by women only, who, in return for the alms they received, presented the donors with sprigs of evergreens, probably with a view to the decoration of their houses against Christmas. About 1799 this custom was practised by the women no farther off than Pinner, thirteen miles from London. Mr. Ellis says this practice "is still kept up in Kent, in the neighbourhood of Maidstone." One of Mr. Hone's correspondents remarks, that in the above town and its vicinity, St. Thomas's is called Doleing-day, from a usage which has existed there from time immemorial of soliciting and receiving charity on that festival. Brand records, "My servant B. Jelkes, who is from Warwickshire, informs me that there is a custom in that country for the poor on St. Thomas's day to go with a bag to beg corn of the farmers, which they call going a *corning*." Fosbroke states that a like practice prevails in Herefordshire on this anniversary, which is there called Mumping-day. In London, on this holiday, ward-motes are held for the election of the inquest and common councilmen, and other officers, who are annually chosen for the service and representation of the respective wards.

December 24.—Christmas Eve.

This is the vigil of the Feast of the Nativity, and was regarded with peculiar affection and reverence in the Middle Ages. Numerous and beautiful were the opinions which popular superstition formerly entertained respecting it: opinions of which several yet linger here and there, among our rural population. Perhaps the finest of them is that alluded to by Shakespeare in the following lines:

"Some say, that ever 'gainst that season comes
Wherein our SAVIOUR'S birth is celebrated,
The bird of dawning singeth all night long;
And then, they say, no spirit dares stir abroad;
The nights are wholesome; then no planets strike,
No fairy takes, nor witch hath power to charm,
So hallow'd and so gracious is the time."

"Here," says a pleasing writer, "a sort of mental metonymy has taken place; and the crowing of the cock,—which in the early stage of the belief was imagined to be the signal for the departure of evil spirits, only because it announced the morning,—is, in the further stage which we are examining, held to be a sound *in itself* intolerable to these shadowy beings. Accordingly, it is supposed that on the eve of Christmas, 'the bird of dawning singeth all night long,' to scare away all evil things from infesting the hallowed hours." The peasantry in the south-western counties of England, and perhaps in other districts, still believe that the cattle are to be found kneeling at midnight of this vigil, as if in reverence of the miraculous birth. In some parts of our island, the bees are popularly said to sing at the same hour in their hives. "These," remarks an excellent author, "are superstitions, but superstitions based on the principle of adoration, and as purely poetry as the *Iliad*." Brand is of opinion that the former of these notions originated in certain representations of the Nativity by the early Christian painters; we would suggest that the ancient *hymners* themselves were indebted for the idea to remote ecclesiastical tradition. The same antiquary relates that a Cornish peasant told him, in 1790, of his having, with some others, watched several oxen in their stalls, on the eve of old Christmas day, and that "at twelve o'clock they observed the two

oldest oxen fall upon their knees, and (as he expressed it in the idiom of the country) make a cruel moan like Christian creatures." To those (says a writer before cited) who regard the analogies of the human mind—who mark the progress of tradition—who study the diffusion of certain fancies, and their influence upon mankind—an anecdote related by Mr. Howison, in his "Sketches of Upper Canada," is full of comparative interest. He mentions meeting an Indian, at midnight, creeping cautiously along, in the stillness of a beautiful moonlight Christmas-Eve. The Indian made signals to him to be silent; and, when questioned as to his reason, replied—"Me watch to see the deer kneel; this is Christmas night, and all the deer fall upon their knees, to the Great Spirit, and look up."

In some places, particularly in Derbyshire, it is asserted that the watchers on this mysterious eve may hear the ringing of subterranean bells, and in the mining districts the workmen declare that high mass is solemnly celebrated in that cavern which contains the richest lode of ore,—that it is brilliantly lighted up,—and that the divine office is chanted by unseen choristers. In Ireland, Germany, and probably in some parts of England also, the night of Christmas-Eve is regarded as a season of omens, and usages exist for "gathering its auguries" having a resemblance to those practised in Scotland at Halloween, which we have elsewhere described.

OLD AND POPULAR CUSTOMS.

"Domestic and religious rite
Gave honour to the holy night;
The damsel donned her kirtle sheen;
The hall was dressed with holly green;
Forth to the wood did merry-men go
To gather in the mistletoe.
Then open'd wide the baron's hall,
To vassals, tenant, serf and all;
Power laid his rod of rule aside;
And ceremony doffed his pride.
The heir with roses in his shoes,
That night might village partner choose;
The lord, undergating share
The vulgar game of 'post and pair.'
All hailed with uncontrolled delight
And general voice the happy night,
That to the cottage, as the crown,
Brought tidings of salvation down."

It was thus that the vigil of the REDEMERER'S birthday was formerly celebrated in "Merrie England." Towards evening the church bells rang out joyously; sportive parties assembled round the fire; candles of an unusual size were ignited in token of the advent of the "Light of light;" and the *Yule Clog*, or Christmas block, brought in with much ceremony and kindled on the hearth. In reference to this last practice Herrick blithesomely sings:

"Come bring, with a noise,
My merry, merry boys,
The Christmas log to the firing;
While my good dame she
Bids ye all be free,
And drink to your heart's desiring.
"With the last year's brand
Light the new block, and
For good success in his spending,
On your psaltres play,
That sweet luck may
Come while the log is a teending." 1

As the servants, remarks a chronicler of old customs, were entitled to ale at their meals while the block lasted, they usually endeavoured to get as large a one as the fire-place would admit of; and hence it is scarcely surprising to learn, that, in the time of the Civil War, a good house in England (that of Hagmond Abbey, near Sarum) was burnt down in consequence of the kindling of a too large Yule clog. It was either a

general or local custom to have the block bandaged round in nine places, and as each bandage, in succession, was burnt off, to hand round a service of ale, mingled with spirits, to the party assembled. Brand states the usage of burning the Christmas Block in Devonshire and the north of England. "At Ripon, in Yorkshire," says a writer in 1780, "on Christmas Eve, the chandlers sent large mold candles, and the coopers logs of wood, generally called *Yule Clogs*, which are always used on Christmas Eve; but should it be so large as not to burn all that night, which is frequently the case, the remains are kept till Old Christmas Eve."

In former times, it was customary on the 24th of December, to roast apples on a string, till they dropped into a large bowl of spiced ale. Furnitry, we are told, always formed part of the supper on this Even; and "there was a prevalent superstition that bread baked then never would turn mouldy." In addition to the above "old and popular customs," others, of a local nature, are, or were formerly, observed at this season, which deserve to be recorded in these pages.

In Devonshire, they still bless the orchards at this time, according to the old verses:—

"Wassail the trees, that they may hear
You many a plum, and many a pear:
For more or less fruits they will bring
As you do give them wassailing."

In some places (we are told) they walk in procession to the principal orchards in the parish. In each orchard, one tree is selected as the representative of the rest, and is saluted with a certain form of words. They then either sprinkle the tree with cyder, or dash a bowl of cyder against it. In other places, only the farmer and his servants assemble on the occasion, and, after immersing cakes in cyder, hang them on the apple-tree. They then sprinkle the tree with cyder, pronounce their incantation, dance round the tree, and then go home to feast. A contributor to the *Gentleman's Magazine* for February, 1795, thus describes an amusement practised on Christmas Eve at the mansion of a worthy baronet, at Ashton, near Birmingham, down to the end of the last century. He writes:—"As soon as supper is over, a table is set in the hall. On it is placed a brown loaf, with twenty silver threepences stuck on the top of it, a tankard of ale, with pipes and tobacco; and the two oldest servants have chairs behind it, to sit as judges, if they please. The steward brings the servants, both men and women, by one at a time, covered with a winnow-sheet, and lays their right hand on the loaf, exposing no other part of the body. The oldest of the two judges guesses at the person, by naming a name, then the younger judge, and lastly the oldest again. If they hit upon the right name, the steward leads the person back again; but, if they do not, he takes off the winnow-sheet, and the person receives a threepence, makes a low obeisance to the judges, but speaks not a word. When the second servant was brought, the younger judge guessed first and third; and thus they did alternately, till all the money was given away. Whatever servant had not slept in the house the preceding night forfeited his right to the money. No account is given of the origin of this strange custom, but it has been practised ever since the family lived there. When the money is gone, the servants have full liberty to drink, dance, sing, and go to bed when they please." "At York," says Stukeley, only a century ago, "on the eve of Christmas-Day, they carry mistletoe to the high altar of the cathedral, and proclaim a public and universal liberty, pardon, and freedom to all persons inferior, and even wicked people, at the gates of the city, towards the four quarters of Heaven." "In the Isle of Man," relates Waldron, "on the 24th of December, towards evening, all the servants have a holiday; they go not to bed all night, but ramble about till the bells ring in all the churches, which is at twelve o'clock:

prayers being over, they go to hunt the wren; and, after having found one of these poor birds, they kill her, and lay her on a bier; bring her to the parish church, and bury her 'with a whimsical kind of solemnity, singing dirges over her in the Manks language, which they call *hey knell*; after which Christmas begins." At Dewsbury, Yorkshire, one of the church bells is tolled as at a funeral on Christmas Eve; and any one asking whose bell it was, would be told that it was the devil's knell. "The moral of it is, that the devil died when CHRIST was born." This custom was discontinued for many years, but revived by the vicar in 1828. Little troops of boys and girls go about at Newcastle-upon-Tyne, and other places in the north of England, some nights before, and on the night of, Christmas Eve, knocking at the doors, singing their Christmas carols, and wishing a happy New Year. They get in return, at the houses they stop at, pears, apples, nuts, and money. At Folkestone, Kent, the fishermen formerly chose eight of the largest and best whittings out of every boat when they came home from their fishery, sold them apart from the rest, and out of the money arising from them they made a feast every 24th of December, which they called a *Rumbald*. The master of each boat provided this feast for his own company. This usage has been long discontinued.

Our space will not allow of our descanting upon such Continental customs as appertain to the vigil of the Nativity: one, however, peculiar to Germany, is of too interesting a nature to be passed over without mention. The children make little presents to their parents, and to each other, and the parents to their children. For three or four months before Christmas the girls are all busy; and the boys save their pocket-money to make or purchase these presents. Then, on the evening before Christmas-Day, one of the parlours, into which the parents must not go, is lighted up by the children. A great bough of yew or birch is fastened on the table, at a little distance from the wall; a multitude of little tapers are fixed on the bough, but not so as to burn it till they are nearly consumed; and coloured paper, &c. hangs and flutters from the twigs. Under this bough the children lay out, in great order, the presents they mean for their parents, still concealing in their pockets what they intend for each other. Then the parents are introduced, and each presents his little gift; they then bring out the remainder, one by one, from their pockets, and present them, with kisses and embraces. On the next day, in the great parlour, the parents lay on the table the gifts for the children. A scene of sober joy succeeds; as, on this day, after an old custom, the mother tells privately to each of her daughters, and the father to his sons, that which he has observed most praiseworthy, and that which was most faulty, in their conduct. "Formerly, and still in all the smaller towns and villages throughout North Germany," says Coleridge, "these presents are sent by all the parents to some one fellow, who, in high buskins, a white robe, a mask, and an enormous flax wig, personates Knecht Rupert, i.e. the servant Rupert. On Christmas night, he goes round to every house, and says that JESUS CHRIST, his Master, sent him thither. The parents and elder children receive him with great pomp and reverence, while the little ones are most terribly frightened. He then inquires for the children, and according to the character which he hears from the parents, he gives them the intended present, as if they came out of heaven from JESUS CHRIST. Or, if they should have been bad children, he gives the parents a rod, and, in the name of his Master, recommends them to use it frequently. About seven or eight years old, the children are let into the secret, and it is curious how faithfully they keep it.

RELIGIOUS OBSERVANCES.

"On Christmas Eve the mass was sung;
That only night in all the year
Saw the stolen priest the chalice rear."

In Roman Catholic countries mass is never said at night, except on the above vigil. Such, in mediæval times, was the practice throughout Christendom; and "well indeed," exclaims Mr. Digby, "might the church appear a delightful place on that blessed night, when the altar, illuminated by a sudden splendour, proclaimed in symbol the happy day which had risen upon the world. Nothing was even wanting that could add majesty to the solemn scene in the estimation of men of secular minds. Emperors and kings claimed as a privilege the honour of reading the Seventh Lesson, which records the decree of Cæsar Augustus." Anciently, on Christmas Eve, every one kept watch, like the shepherds, while minstrels chanted carols in celebration of the Nativity. This observance is still retained in the Isle of Man. The people assemble in vast numbers at church, where the divine office is solemnized, and followed by a sermon; after which, the congregation remain in the sacred edifice, singing carols, until midnight. "In Rome, on this Even," relates the author of *Rural Life in England*, "the pipes of the Calabrian minstrels are heard in the streets. The decorators are busy in draping the churches, clothing altars, and festooning façades. Nuns and ladies are preparing dresses, crowns, necklaces, and cradles, for the Madonna and Child of their respective churches. The cannons of St. Angelo announce the festival; shops are shut, and saloons deserted. The midnight supper and the midnight bands begin the 'holy revel'; and the splendid pomp in which the august ceremonies are performed at the churches of the Quirinal, St. Louis, and the Ara Cœli, is succeeded by a banquet, of which even the poorest child of indigence contrives to partake. The people from the mountains of the Campagna flock in to witness and to enjoy the fête, and present a strange sight of wild figures amid the inhabitants of the city. The churches are lit up with thousands of wax tapers; the cradle of CHRIST is removed from the shrine at the chapel of Santa Maria Maggiore, and carried in procession to the chapel of the Santa Croce; and the pope himself performs divine service in the Sixtine Chapel."

WOMAN'S COURAGE.

THE annals of 1780 record a remarkable case where a long course of robbery was brought to light, and a frightful murder prevented in the very act, by a woman's courage. Abraham Danford, the chief criminal in the transaction, himself detailed with minute accuracy his course from the first act of dishonesty to the ferocious outrage which cost him his life. The skill and tact requisite for carrying out his first plans hardly prepare us for the more ruffianly atrocity which concludes his career.

At that period, money was chiefly sent by parcel, and an ingenious plan occurred to him by which he could, with little risk, put himself in possession of any parcel which struck him as likely to be of particular value, while it yet lay in the carrier's office previous to delivery. "The method (says his confession) which I chiefly put in practice, was forging the post-marks of the different towns, which I put on a piece of paper, made up as a letter, and then went to the inns where the coaches came, and heard the parcels called over; then went to a public-house near, and wrote the direction of the letter the same as was on the parcel I had fixed on. The book-keeper seeing the direction the same, and the post mark on it, they usually gave me what I asked for, on paying their demand."

The addresses on the parcels would give him some idea of their value, and of six of these thefts that he records, five contained considerable sums of money. Among his first experiments, was one on Messrs. Smith, Wright, and Grey, bankers, by which he got a parcel with £500. enclosed. Having gone on a considerable time, with impunity, and become an adept at forging, he now

practised upon the same house in another way, by forging an accepted bill, which he lodged in the bank till it became due. This pretended bill he directed to an empty house in Water-lane, Blackfriars, and some days before it was due, he hired this house, and with an impudent show of haste and anxiety, requested for the key, under pretence of getting it aired before he entered upon it. The owner of the house being made acquainted with the haste of his new tenant, and not much liking his appearance, now went to one Mrs. Bouchier, the landlady of a public-house opposite, of whose good sense he had had reason to form a high opinion, and requested her to keep watch upon the man's proceedings, which she promised to do.

For some time, nothing remarkable happened, but on the day on which the bill became due, Messrs. Smith, Wright, and Grey, despatched one of their clerks, William Waits, a quaker, to pay the money to the person indicated in the bill. It is not quite certain whether Dandford meditated violence beforehand; it may be that the man's subdued and defenceless appearance suggested the attack at the moment; but the presence of an accomplice, prepared for any atrocity, leads rather to the supposition that the crime was premeditated; and that taking for granted that a clerk calling to discount a bill might have other errands of the same kind before him, and, therefore, much money on his person, they had planned, in cold blood, to rob and murder him.

Mrs. Bouchier, who, after the instructions she had received, was on the watch, observed on that day two men enter the house, and open the parlour window. Some time after, a third person, a quaker, came up, knocked at the door, was admitted, and the door closed and fastened behind him. Something in the circumstances and the appearance of the first men excited her suspicion, and she kept her eye and her attention fixed upon the house. Presently she thought she heard a strange noise proceed from it, not loud, but which she could not account for. She crossed over the street, and listening attentively, soon heard the word "murder" pronounced in a hoarse, faint voice, succeeded by a kind of groaning, which very much alarmed her: and looking through the key-hole of the house door, she saw two men dragging the unfortunate quaker down the cellar stairs. On this, she screamed out to the passers-by, that they were murdering a man within the house, and while she knocked violently at the door, called upon the people in the street to break it open; but with that apathy which is sometimes met with in such a crisis, no one would stir, or regard her exclamations. Enraged at their stupidity, she broke open the parlour window herself, and as she was forcing her way through, one of the villains who had been interrupted and alarmed by the knocking, opened the door, and was running off at full speed. At the sight of him, however, the lookers-on roused themselves, set up a cry of stop thief, and presently made him their prisoner. The other ruffian Mrs. Bouchier herself seized by the throat, and dragged him across the street to her own house. It appeared that the villains had first robbed the poor man of his pocket-book, and then, to stop his cries, had nearly throttled him, while they were hurrying him down the back-cellar stairs, there to complete their crime by his murder. A design which would certainly have been carried out, but for this woman's fortitude and presence of mind, thus providentially interfering for his protection.

When the two prisoners were brought before the Lord Mayor for examination, William Waits, as a quaker, refused to give evidence upon oath of the assault that had been made upon him. Arguments were used in vain, and it was much feared that the villains would escape for want of sufficient evidence against them. In the end, however, Mrs. Bouchier's testimony, and that of her assistants, was deemed conclusive. The prisoners were condemned and executed, with several others, at Tyburn, having previously made great professions of penitence and contrition.

SIR WALTER SCOTT'S TOMBSTONE.

We find the following interesting particulars, regarding the monument to be placed over Sir Walter Scott's grave at Dryburgh Abbey, in the *Leeds Mercury* :—

"The Aberdeen papers state that a monumental stone for the grave of Sir Walter Scott has been constructed there :—

"At the works of Messrs. Macdonald and Leslie of Aberdeen, there has just been executed a massive tombstone, which is to be placed on the contiguous graves of the late Sir Walter Scott, and of Lady Scott, at Dryburgh Abbey. It consists of a large block of the beautiful red granite, cut from Messrs. Macdonald and Leslie's quarries at Stirling Hill, near Peterhead, on the property of the Earl of Aberdeen. The block is seven feet long, by six and a half feet broad, and weighs nearly five tons. The upper surface is cut in the form of the top of a double sarcophagus. On the one compartment is the following inscription :—

'Sir Walter Scott, Baronet,
Died September 21, A.D. 1832.'

On the other :—

'Dame Charlotte Margaret Carpenter,
Wife of
Sir Walter Scott of Abbotsford, Baronet,
Died at Abbotsford, May 15, A.D. 1826.'

'The letters are very deeply cut in the imperishable material of which the tombstone is composed, and will prove faithful to the record of departed genius and worth with which they are charged, in defiance of the elemental action of many a future age.'

"We happen to know some of the incidents connected with this Monument, which, as they relate to the "mighty dead," and explain the cause of the long delay in its erection, are worthy of recital. Many years since, the late Sir Francis Chantrey promised to furnish a design for the Dryburgh monument. His numerous engagements, however, and his declining health, interfered with this intention, and it seemed to be utterly forgotten. At length, on the suggestion of Mr. Lockhart, Mr. Cadell, the publisher, called on the eminent sculptor and reminded him of his offer. "You shall have it," said Chantrey: "Dryburgh, you know, is a ruin, and the structure above Sir Walter's grave will come down some stormy morning. Now, my purpose is to put over the grave a huge granite block that will defy all such assaults, and baffle time itself." He hastily sketched an outline of what he proposed; but the design went no farther, and death soon carried off the artist. His friend and assistant, Mr. Allan Cunningham, was then applied to; he recollected the conversation, found Chantrey's rough sketch, and extended it in the form of a more regular drawing. He was next authorised to arrange with the Aberdeen granite workers, and on the very evening that he died—only a few hours before his decease—Allan wrote to Mr. Cadell closing the transaction. This was the last line traced by his busy hand, and, as such, his family asked and obtained possession of it. And thus, after the sudden deaths of two remarkable men, who sought to honour the memory of one still greater, the simple massive structure which they designed has been completed.

"Such burial the illustrious Hector found!"

Chantrey had a partiality for huge granite sepulchres, independently of the fitness of such an erection for the grave of Scott. He ordered that his own tomb at Norton, in Derbyshire, should be composed of wrought granite, covered by an enormous square of the same material; and that even this lasting memorial might be carefully preserved, he left by his will yearly sums to the Vicar and Schoolmaster of Norton, payable only "so long as his tomb shall last," and ten poor boys of the parish shall be instructed to remove the moss and nettles from around the edifice. This seems to agree a

"fond desire and longing after immortality;" yet it might be intended to ripen into useful fruit. Some among the successive generations of poor boys who pluck the nettles from the grave of the sculptor may be led to think of his high art and his fame, and to emulate his genius—for he, too, was once a poor boy. The busts of Chantrey are, however, his best monument,—the living, intellectual marble will outlast the ponderous masses of dead granite."

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE CONTEST.

Two shepherds had a friendly strife,
Who would sing the sweetest lay;
A third came by when words were rife,
To give the prize away.
They sat them down beneath the shade
Of a wide chesnut tree,
While flocks were busy at the blade,
And murmur'd low the sea.
One took his pipe and gaz'd around,
On bright fields smiling by;
He caught th' exulting wild bird's sound,
He gazed upon the sky.
The lazy breeze all soothing blew,
And joyful he began,
And o'er the wave the glad notes flew,
And through the woods they ran.
And joy was in the shepherd's eyes,
The birds e'en listened long;
The umpire felt he'd gained the prize,
Who had sung such happy song.
The song had ceas'd; the smile had fled,
As ripple on the sea,
And downcast was the other's head,
And sad he seem'd to be.
Upon the earth he fix'd his eye,
His thoughts how far were they;
Like troubled waters is the sigh,
As they forsake the sea.
Through his own spirit had he gone,
Through many hopes and fears,
He took his pipe, and sadly on
He sung with swelling tears.
Upon the bosom of the two,
The low note struck its tone,
And true it was, ah! it was true,
As each one stood alone.
The echoes fell, no voice arose,
To tell how little he had done;
The silence and the still repose,
Proclaimed that he had won.

Miscellaneous.

"I have here made only a speegee of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

ANCIENT CORONATION CEREMONIES.

Most of the ancient ceremonies observed at the coronation banquets of the Anglo-Norman and Plantagenet services were revived by James the Second at his coronation. The lords who claimed the office of sewers that day, went to the dresser of the kitchen to receive the dishes. The master of the horse officiated as serjeant of the silver scullery, and went in person to the kitchen bar to take assay of the

king's meat, which was thus performed: having called for a dish of meat, he wiped the bottom of the dish, and also the cover, within and without; tasted it, covered it, and caused it to be conveyed to the royal table; and, attended by a procession of all the great officers of the household, including the earl-marshal, with his rod; the great high steward, with his white staff; the lord high constable, with his constable's staff; rode up the hall on horseback, preceding the first course. Thirty-two dishes of hot meat were brought up by the knights of the bath, bareheaded, followed by a supply of other dishes by private gentlemen. Then the lord of the manor of Addington had the satisfaction of placing the mess of dillegrount before their majesties, and was afterwards knighted for his pains.—*Strickland's Queens of England*, vol. IX.

A GUEST TOO MANY.

THE colonel who commanded on the frontier discovered that there were "crimps" on the other side. They were well-dressed and disguised, and came over to tamper with the men. The day after Lord Durham's review, a number of visitors came over from the opposite shore, among them one of these crimps, who, unfortunately for himself, pitched on the colonel's orderly, a peninsular veteran, who allowed him to go on, and afterwards pointed him out to his colonel, as he was turning into the great *table-d'hôte* at which we all dined, together with the visitors who daily came to see the lions. After dinner the colonel got up. He was a magnificent fellow—a noble figure—the hero of a hundred fights. He began with a little soft sawder; the Yankees were all attention:—"He regretted that there should be a set of persons on the other side who tried to induce his men to desert their colours, and forfeit their honour and allegiance to the queen of England. There is such a man here present"—here he beckoned to his orderly to step forward, on which a man, covered with rings and chains, was observed to turn deadly pale—"who, by his appearance ought to be above such rascally actions." Upon a "Yes, sir, that's he," from the orderly, the colonel, with Herculean strength, took hold of the fellow by the collar, and, lifting him completely off his seat, gave him a kick in that part where the smallest particle of honour, be there any, is supposed to be seated, and handed him over to a file of the guard, to see him safe to the other side of the water.—*Echoes from the Backwoods*. Vol. ii. p. 142.

LEARNING is like a river, whose head, being far in the land, is, at first rising, little and easily viewed: but still, as you go, it gapeth with a wider bank: not without pleasure, and delightful winding; while it is on both sides set with trees, and the beauties of various flowers; but still, the further you follow it, the deeper and the broader it is; till, at last, it enwaves itself in the unfathomed ocean. There you see more water; but no shore, no end of that liquid, fluid vastness.—*Feltham's Resolves*.

N.B. The Second Volume of this Periodical is now ready; Covers for binding, with Table of Contents, may be ordered of any Bookseller.

The Legend of the Christmas Tree.

'Tis Christmas Eve, and through the ancient town
Rest and rejoicing meet—
A little child comes wand'ring sadly down
The silent street.
Alone and very sorrowful is he,
Fatherless and motherless;
He has no friend on earth a Christmas-tree
For him to dress.

With tearful gaze he turns his steps aside
Where gleams the light
From a tall house, and youthful figures glide
Before his sight,
As each, with festal dress and happy brow,
Surrounds a gorgeous tree;
And there he asks, "Amid these is there now
No place for me?"

"They look so happy, surely they are kind."
With trembling hand
He gently knocks, and craves a place to find
Where he may stand,
Contented but to gaze upon the show,
With grateful prayer,
That they the sad reverse may never know
Which brings him there.

Alas! alas! no place for him is there,—
With scornful jest
They drive him forth into the cold night air,
To seek for rest
'Neath some more modest roof, where warmer hearts
A nook may spare,
And gladly own that sharing joy imparts
More to their share!

Hark ! 'tis a burst of hearty merriment—
The child draws nigh,—
'Tis from a burgher's simple tenement.
With longing sigh
He watches the glad group of faces bright,
And so for him
He thinks the fir-tree once was decked with lights;
His eyes grow dim.

And timidly he knocks, again to tell
His piteous tale.
Alas ! for him—on stony ears it fell
Without avail !
The door is closed against him, and in vain
With grief indeed,
He gazes through the latticed window pane—
No one takes heed !

Weeping he turns away, and passes by
Both light and sound
From many a humble roof and mansion high
Scattered around :
Then pauses meekly by the lowliest door,
Where a faint ray
Breaks through, and shows how fast the little store
Of tapers wears away.

Alas ! alas ! his latest hope is vain—
By word and blow
Of harsh unkindness driven forth again,
Where shall he go ?
The night is dark—but the poor orphan child,
Amid his woe,
Bethinks him of the infant Saviour mild,
And kneeleth low.

In prayer to Him who is not slow to hear
He kneeleth there,
And soon he sees a little child draw near,
Exceeding fair ;
With whitest raiment shining like the day
And crown of light,
And as he moves along the darken'd way
All becomes bright !

So to that patient wanderer came he
And bade him rise
His wonder'ing eyes where springs a glorious tree,
And offer praise
To God who heareth the sad orphan's cry,
And sendeth aid
When earthly hope is none—and misery
Naketh afraid.

No longer sad and fearful is that child—
He turns to see,
Where stands at bidding of the infant mild
His Christmas tree !
A wondrous tree, radiant in heavenly light—
With one glad bound
He leaves the gloom of sorrow's bitter night --
His home is found !

CHRISTMAS AS IT IS.

AMIDST all the Feasts and Fasts which shine in the Calendar of man's devotion, there is none so radiant with holy joy and gladness as the Festival of Christmas. Hence its celebration in various ages has called forth the liveliest sympathies of man, in festal *chansons*,—not such as are current at this day, as carols, since these are comparatively recent substitutions for the joyous carol of earlier times. It is important to note, that Christmas has been from very remote times a season of rejoicing; for, as Fuller quaintly says, "Though Christ was humbled to a manger, the contempt of the place was took off by the glory of the attendance and ministration of angels." Indeed, the celebration has been for centuries ordained as a time of joy: it was forbidden to be kept as a fast by the Council of Braga, A. D. 563; which anathematized such as did not duly honour the birth-day of Christ, according to the flesh, but pretended to honour it by fasting on that day; a custom attributable to the same conception which led to the practice of fasting on the Lord's Day, namely, the belief that Christ was not truly born in the nature of man. Since this Canon, we do not find any positive regulation specially affecting the observance of Christmas. (See *Neale's Feasts and Fasts*.)

A contemporary has pleasantly versified this joyful spirit:

"O why was England 'merrie' call'd,
I pray you tell me why?—
Because Old England merry was,
In merry times gone by !
She knew no dearth of honest mirth
To cheer both son and sire,
But kept it up o'er wassail cup
Around the Christmas fire."

But one of the finest pictures of the joys of olden Christmas is by a poet whose heart o'erflowed with kindly feeling towards his race:

"The glowing censers and their rich perfume,
The splendid vestments, and the sounding choir;
The gentle sigh of soul-subduing piety;
The alms which open-hearted charity
Bestows with kindly glance, and those
Which e'en stern avarice,
Though with unwilling hand,
Seems fore'd to tender; an offering sweet
To the bright throne of mercy; mark
This day a festival.

Thus sung WALTER SCOTT, who carried out his creed into the hall of Abbotsford, as well as in his own sweet verse.

Elsewhere in this sheet will be found detailed the olden celebrations of Christmas, in customs which belong, perhaps, to a more picturesque age than our own; though we are not inclined to regard the discontinuance of many of these customs at the present day as a falling off in the feelings of the people. The joy of the people we take to be as great, though it is less boisterous in its displays: the holy joy must remain for ever, though the popular participation may change. It has been sensibly observed, that, although much of the custom of profuse hospitality has passed away, Christmas is yet universally recognised as a season when every Christian should show his gratitude to the Almighty for the inestimable benefits procured to us by the nativity of our blessed Saviour, by an ample display of goodwill towards our fellow-men. And here, a hint from old Fuller may not be out of place: "Hospitality is three-fold: for one's family; this is of necessity: for strangers; this is of courtesy: for the poor; this is charity."

At no period of the year is the exercise of this kindly virtue so directly prompted by association and right feeling, as at Christmas. By the season itself, the wants and necessities of the poor are increased, not unfrequently, to distressing extremity. From the palace to the prison, from the hall to the humble home, there are countless opportunities for the practice of Fuller's third hospitality. Hence, one of the best indications of the approach of Christmas is the distribution of fuel, food, and clothing, by those, who, blessed with this world's wealth, really "enjoy the luxury of doing good." The yule-logs may not blaze upon the hall hearth so numerously as of old; the apportioning of "firing" to our poorer neighbours will gladden their hearths, and light up even the gloom of poverty. Meat is another acceptable boon; the ox is not roasted whole, as heretofore; as the maxim-monger says, it proclaims plenty of labour and invention, but affords less of what is delicate, savoury, and well concocted, than smaller pieces, at home. And the provision of additional clothing at this season, will not only increase the comfort of home, but personal neatness, one of the best indications of good order.

All these gifts will be well bestowed upon those who are

"Poor, yet industrious, modest, quiet, neat."

Yet there is another class who should not be forgotten. The inmate of the prison, he who may have forfeited his claim to the bounty of his fellow-men, if not left uncheery at this festive season, but regaled with some of its goods, may have recalled to his mind the holiness of the day, and thus be led to reformation. Such would, indeed, be one of the brightest hospitalities of Christmas! For, as the old divine says: "If these little impulses set the great wheel of devotion on work, the largeness and height of that shall not be at all prejudiced by the smallness of its occasion. If the fire burns bright and vigorously, it's no matter by what means it was

first kindled; there is the same form and the same reflecting virtue in it, kindled by a spark from a flint, as if it were kindled by a beam from the sun."

The axiom, "'Tis distance lends enchantment to the view," is, perhaps, exemplified in estimating the joys of Christmas in centuries long past, higher than those of Christmas at present. That we may arrive at a true estimate, let us glance at such of those ancient celebrations as time has left us, and such novelties as the inventive ingenuity of our own day has suggested.

The approach of Christmas is still denoted by festive preparations—not, as in olden time, principally by "the great barons and knights, who generally kept open house at this season"—but among all classes of the people. Clubs are established among the working classes, for securing the Christmas luxury by small savings; the geese and grocery thus insured is prodigious, and any grocer's shop window, in the lowness of its prices, compared with those of forty years since, will give you a better idea of the blessings of peace, than a folio of history. The Smithfield Club Cattle Show,—though somewhat "overgrown," reminds us of the improved methods of feeding and fattening, and throws into the shade the lean kine of other days, when the killing of an ox was an event. Again, the prize beef may be an excess, but it is the means of improving the quality of meat generally.

Some outward signs are preserved to us; the waits perambulate our streets, not playing the humdrum of the last century, but the Italian Opera airs of the last season; holly, mistletoe, and evergreens, are brought in cartloads to deck our churches and houses, as the natural gratitude of the season. Among the old Romans these were the emblems of peace, joy, and victory; in the Christian sense they may be applied to the victory gained over the powers of darkness by the coming of Christ.

Our artist has illustrated most picturesquely, the going out to gather the mistletoe of the oak, grounded, as Colleen thinks, "on the Druidical custom:" he has given us, too, the rustic mirth of the occasion by way of episode.

The holiday sights and amusements for young folks have, in our time, greatly improved. Our public exhibitions are worth a century of the shows of old; that is, if rational delight be superior to boisterous mirth and "misrule." The noisy snap-dragon has, to some extent, gone out; but is more than compensated by "the Christmas Tree," an importation, originally from Germany. This tree has now become a fashionable toy of the season: it is entirely artificial, and intermixed with the leaves and branches are confectionary-fruit—as cherries filled with liqueurs, and *bon-bons* of extraordinary sagacity; and sometimes, the branches are hung with tiny lamps, which when lighted have a charming effect. These trees are costly, however: last year we saw one, price several guineas, about to be sent to Windsor Castle, for the amusement of her majesty's children.

The church bells ring merrily in Christmas as heretofore: we have often passed the eve close to St. Bride's church, when the midnight peal of its famed bells has somewhat saddened our excited senses: it was scarcely possible to hear this "mosaic of the air," without being carried on to the sacredness of the day.

At length, the morning breaks, and those

"windpipes of hospitality," countless chimneys, smoke with the preparatory cheer: the pudding, (upon which the grave Johnson meditated profoundly,) requires long boiling, and the fires must be lighted early. The church bells proclaim the hour of service, though not until the distribution of gifts has taken place at the church: where may be seen the minister of our holy religion, dispensing gifts and goods placed at his disposal, recorded in letters of gold upon the church walls; or from a fund raised for the season, and headed by his own benevolence; such being old Fuller's third hospitality—"for the poore; this is charity." How many thousands of pounds are thus annually distributed through the length and breadth of the land, at each returning Christmas, it were vain to attempt to tell; and long may the amount thus baffle calculation!

Abroad there is a healthy stir: faces are brighter than usual, and those of the very poor beam with gladness; the church, too, is dight with festivity; "the psalms, and hymns, and spiritual songs," toll of the day; the sermon discourses of its duties and its pleasures; the blessing succeeds, then the Holy Communion; and all depart to carry the precepts, the good seed, to homes and bosoms. The dinner follows; perchance the landscape is clothed with snow, or the "eager" air reminds those about to partake of the feast, of the privations of others; the blessing is asked, the repast proceeds; the frosted pudding is brought in with a sort of triumph, as the saucy boar's head was in days of old, with sound of trumpet. The children long to shout, the grown guests rejoice in their way; and thus the day is passed. Will any one say this is not "Merrie England?"

Our artist, too, has commemorated the olden ceremony of bringing in the sused boar's head. At the Temple dinners, Dugdale tells us, "at the first course is served in a fair and large bore's head upon a silver platter, with minstrelsy." The custom is retained to this day, at Queen's College, Oxford, where a boar's head, fairly decorated, is on every Christmas Day carried in procession into the Hall, accompanied by the singing of a carol, "with many innovations," from Wynkyn de Worde's celebrated collection.

"With bore's hende in hande bring I,
With garlandes gay and rosmery;
I pray you all synge merely,
Qui estis in convivio."

Reading for the Young.

THE CHRISTMAS-BOX.

ROSE MARTIN'S father lived in the service of Mr. Stanley, as gardener; he had the use of a very comfortable roomy cottage, which stood near the gardens of his master, and a more pleasant situation could not well be found. On either side were meadows and plantations; in front a good bit of ground for a garden, and at the back a small orchard. The garden was filled with all sorts of things: there were vegetables in plenty; raspberry, currant, and gooseberry bushes; early in the year it was gay with spring flowers, and later in the season with china asters and dahlias. Besides all these, there was a goodly row of bee-hives; and hutches, filled with rabbits, were piled one upon another. Between this garden and the pleasure-ground of Mr. Stanley, a smooth gravel road led up to the stables, and other outbuildings.

Rose had never had much schooling; but her grandmother, who lived in the same house, taught her to read and spell; her mother to hem and sew, and also, as soon as she was old enough, to assist her in laundry work; for Mrs. Martin took in washing from the Great House, as it was called. At odd times Rose worked under her father, weeding the shrubberies, sweeping up dead leaves, or gathering peas and beans. Upon the whole, she led a very easy life, for her work was never hard, and she had plenty of good wholesome food to eat.

Mr. Stanley had several children, but they were all grown up, and most of them settled in the world; one little girl there was, however, belonging to the Great House, of the same age as Rose, that is to say, about ten or eleven years old. This was Miss Grace Stanley, who, having lost both her parents, was brought up by her grandfather. Most part of her time was spent at school; but at Christmas and Midsummer Miss Grace always came home for the holidays, and on such occasions, so soon as she had looked about her, run up and down stairs, and talked to everybody in the house, she usually made her way to the gardener's cottage, to talk to Rose's mother, and old Mrs. Martin, who had been her papa's nurse,—play with the kittens, if there chanced to be any, and feed the rabbits. Now I may as well tell you at once that Miss Grace was rather too fond of talking, and indeed, of listening also; for she liked to hear every thing, and what she heard she commonly repeated to the first person that came in her way.

"Oh dear! Mrs. Martin," said Miss Grace, on one of these holiday visits, "do you know that I got into such a scrape this last half! at least I was very near being in a bad scrape."

"Dear! dear!" said old Mrs. Martin, in reply, "I am sorry to hear you say that, Miss Grace."

"And it was all through Miss Cox, one of our teachers—cross toad!"

"Oh! Miss Grace, my dear, what a word was that to come out of a young lady's mouth!"

"Why, dear me! what signifies? we are not so particular at school; besides, it was nothing so very bad after all—and I have brought home another prize book, Mrs. Martin—Miss More's Sacred Dramas, with a picture at the beginning of Moses in the bull-rushes; I will bring it next time I come, to show you, Mrs. Martin,—but I was going to say something, what was it? Oh, I know, it was about Miss Cox."

But before Miss Grace Stanley could proceed, young Mrs. Martin bade Rose take her elbows off the table, and run into the orchard to fetch some more clothes to be folded, instead of sitting there, staring in that rude way.

Rose, to be sure, had opened her eyes pretty wide as she listened to the discourse of Miss Grace, and she would much rather have stayed where she was to hear what would come next, but she knew she must do her mother's bidding; so she went, and, almost at the same moment, the young lady, getting a sight from the window of some person on horseback riding towards the stable-yard, forgot again what she was going to say; she wondered who it could possibly be; whether grandpapa had been out riding; but she rather thought not; or perhaps it was Mr. Newton, the doctor, who generally rode up the back way to the house, and she knew that the under housemaid was ill; but then, this gentleman was taller than Mr. Newton; she thought she would run home, and inquire about it. So, with a hasty "good bye," she skipped out of the house, down the garden path, and was soon out of sight.

When Miss Grace reached home, she was told that her uncle Henry, of whom she was extremely fond, had arrived, and was then in the library, with her grandpapa; so giving her shoes a hasty rub on the door mat, she rushed across the hall, and into the library, just as her uncle finished what he was saying, with these words, "I shall give them to her to-morrow by way of a Christmas-box." Miss Grace heard this quite distinctly, and

made sure that the words related to some present intended for herself.

Mr. Henry Stanley was always very kind to his little niece, and, after he had kissed and talked to her for some time in a very amusing way, he took from his pocket a small paper parcel, and, placing it in her hand, said, he hoped she was not grown too much of a woman to eat sugar-plums. Charming sugar-plums they were, both to the look and taste; the box too, which contained them, was ornamented with cut paper, and had a very pretty coloured print on the top of the lid, with a piece of looking-glass inside. But, though Miss Grace thanked her uncle, and admired the box, she did neither so heartily as she would have done, had she not been thinking of the present intended to be given her the following day, and which she took for granted would be something of more value than a box of sugar-plums; something, in short, worthy to be called a Christmas-box. So impatient was she to have her curiosity satisfied on this point, that, unable to contain herself, she ventured to ask her uncle if he had brought her anything else.

"What! in my pocket!" he exclaimed. "A likely story. It is not every uncle would have cumbered himself with a box of sugar-plums, I can tell you, Miss Grace."

The young lady did not dare say another word, but she still thought, that, as her uncle had not positively denied it, something might be forthcoming on the morrow.

When the morning came, and she met her grandpapa and uncle at breakfast, she still thought the same, though to her disappointment the latter, soon after that meal, left the house, and she saw him no more for some hours.

It was winter; the ground was frozen hard, and a little snow had fallen in the night: about noon, however, the sun shone out brightly, and Miss Grace, wrapping herself up in her warmest shawl, and taking in her hand a piece of plain cake for her luncheon, tripped down the shrubbery, and took the path leading to the kitchen garden.

Whisking round the corner of the tool-house, she nearly ran against Rose Martin, who had been sent to tell her father that his dinner was ready, and mother desired he would come and eat it whilst it was hot. Martin, though rather apt to try his wife's patience in this particular, by stopping to finish something or other, had this time set off at once, and Rose was following, when met by Miss Grace, who presently resolved on going with her to the little gate which opened from the shrubbery just opposite the gardener's house. Glad to have found a listener, she chatted away to Rose, telling her all about her uncle Henry's coming the day before, his giving her a box of sugar-plums, and her expectation of a handsome Christmas-box, which she had not yet seen. Rose at first was rather shy of talking to the young lady, for she had been brought up to be humble and respectful, or, in the words of the Church Catechism, to "order herself lowly and reverently to all her betters," but, encouraged by the free and easy manner of Miss Grace, she began to talk in her turn, feeling at the same time that all this familiarity was not quite proper. Mr. Henry Stanley had called at their house, she said, that very morning; grandmother was poorly, and mother had persuaded her not to get up at her usual time. Rose, by her mother's orders, had taken old Mrs. Martin a cup of tea and a morsel of toast, so she was up stairs when Mr. Henry walked in, and, just as she came back, he was going out at the door; she heard him say, however, "I shall like to give it her myself."

"Dear me, Rose, you don't say so!" exclaimed Miss Grace.

"Yes, miss, it's all quite true as I tell you, and I noticed that Mr. Henry had in his hand a parcel done up in whitish paper, and sealed with red wax."

"How large was it?" asked the young lady.

"Why, I can't justly say, miss; it wasn't very big; about the length, may be, of father's pruning knife, and may be as broad as three of my fingers."

"Did you see which way uncle Henry went, Rose, when he left your house?"

"Yes, miss; I see him get over the stile into Bush mead, and he took the path as goes down to the Vicarage. May be, miss, the parcel was for one of Mr. Thompson's children."

"Why, that may be, Rose, for little Selina Thompson is grandpapa's godchild. Very likely he got uncle Henry to buy something for her in London—a necklace, perhaps, or a silver-gilt knife and fork, like that he gave my little cousin Charles Anstey—" but Rose could stay no longer, for they had reached the gate, and she saw her mother looking out for her.

Miss Grace walked slowly back, pondering upon what she had just heard, and feeling rather vexed at the idea of the present being intended, after all, for Mr. Thompson's little girl, instead of herself. She had got some way towards the house, when she met Mr. Stanley: he was going down to the village on business, and told Miss Grace she might, if she pleased, walk with him. This she was ready enough to do, and so they proceeded together. All the trees and shrubs were covered with hoar frost, and glistened brightly whenever the sun glanced upon them; every spray was crusted over with some fantastic shape; every blade of grass stood up stiff as a frozen spear, while the tall bents drooped their heads, and looked like feathers powdered with snow. Mr. Stanley noticed some of these beautiful objects to his little granddaughter; and then he talked to her about the dinner the school-children were to have the following day; of the new warm cloaks to be given afterwards to the girls, and which he proposed she should assist the housekeeper to distribute. When they left the plantations, and got into the lane leading to the village, they met many of their poor neighbours; the women going to the Great House, for portions of beef for themselves and families; boys and girls carrying bundles of holly and mistletoe, to be set up in the servants' hall, where they were to dine on Christmas day. Mr. Stanley stopped to speak to some amongst them, and, as he walked on, repeated to Miss Grace some verses about Christmas, which he thought she would understand and like. The following were some of the lines:—

"Heap on more wood! the wind is chill,
But let it whistle as it will,
We'll keep our Christmas merry still.
And well our Christian sires of old
Lov'd when the year its course had roll'd,
And brought blithe Christmas back again,
With all its hospitable train.
Domestic and religious rite,
Gave honour to the holy night,
That, to the cottage as the crown,
Brought tidings of salvation down."

And no doubt Miss Grace would have thought them very pretty, had she listened as attentively as she ought to have done; but her mind was so full of her own little prying and selfish thoughts, that she heard not much of what her grandpapa said during the whole of their walk, and was only longing for some good opportunity of bringing forward the subject which at that time was most interesting to herself.

Yet Miss Grace was not, on the whole, and in her general behaviour, what might justly be called a naughty child; she had no perverseness of temper, was neither passionate nor sulky, and seldom disobedient; but she had been, from her infancy, too much indulged, and, although taught to believe and know many things that were right, she had never been told it was a duty to deny herself. Self-indulgent she went to school, and, as it was too much the plan there for everybody to take care of number one, self-indulgent, to the best of her power, she continued. Quick at learning, she was seldom

Mia Christmas

HEAP on more wood ; the wind is chill ;
But let it whistle as it will
We'll keep our Christmas merry still.

* * * * *

And well our Christian sires of old
Loved, when the year its course had roll'd,
And brought blithe Christmas back again,
With all his hospitable train.
Domestic and religious rite
Gave honour to the holy night :
On Christmas-eve the bells were rung,
On Christmas-eve the mass was sung.
That only night in all the year
Saw the stoled priest the chalice rear.
The damsel down'd her kirtle sheen ;
The hall was dress'd with holly green ;
Forth to the wood did merry-men go
To gather in the mistletoe.
Then open'd wide the baron's hall
To vassal, tenant, serf, and all ;
Power laid his rod of rule aside,
And Ceremony doff'd his pride ;
The heir, with roses in his shoes,
That night might village-partner choose ;

The lord, undergating, share
 The vulgar game of "post and pair."
 All hail'd, with uncontroll'd delight
 And general voice, the happy night,
 That to the cottage, as the crown,
 Brought tidings of salvation down.
 The fire, with well-dried logs supplied,
 Went roaring up the chimney wide;
 The huge hall-table's oaken face,
 Scrubb'd till it shone, the day to grace,
 Bore then upon its massive board
 No mark to part the squire and lord.
 Then was brought in the lusty brawn,
 By old blue-coated serving man;
 Then the grim boar's-head frown'd on
 high,
 Crested with bays and rosemary.

Well can the green-garb'd ranger tell
 How, when, and where the monster
 fell;

What dogs before his death he tore,
 And all the baiting of the boar.
 The wassail round in good brown bowls,
 Garnish'd with ribbons, blithely trowls.
 There the huge sirloin reek'd; hard by
 Plum-porridge stood, and Christmas
 pie;

Nor fail'd old Scotland to produce,
 At such high tide, her savoury goose.
 Then came the merry masquers,
 And carols roar'd with blithesome din;
 If unmelodious was the song,
 It was a hearty note, and strong.
 Who lists may in their mummery see
 Traces of ancient mystery;
 White shirts supplied the masquerade,
 And smutt'd cheeks the visors made;

But, oh, what masquers richly dight -
 Can boast of besoms half so light!
 England was merry England, when
 Old Christmas brought his sports again.
 'Twas Christmas broach'd the mightiest ale;
 'Twas Christmas told the merriest tale;
 A Christmas gambol oft could cheer
 The poor man's heart through half the year.

Sir W. Scott.

POPULAR YEAR BOOK.

December 25.—Christmas Day.

THE celebration of this most ancient and joyful festival of the Church is most probably of apostolic origin. St. Clement, whose name occurs in the New Testament, exhorts the primitive Christians to "keep diligently feast days, and truly, in the first place, the day of CHRIST'S birth." A prelate in the second century recognises the 25th of December as the anniversary of the Nativity; and, so early as the fourth age, its festive observance had become so excessive, that another saintly bishop saw reason to exhort the faithful to celebrate it less immoderately. "It is a popular article of belief," says Sir Walter Scott, "that those who are born on Christmas and Good Friday, have the power of seeing spirits, and even of commanding them. The Spaniards imputed the haggard and downcast looks of their Philip II. to the disagreeable visions to which this privilege subjected him."

OLD AND POPULAR CUSTOMS.

"Christmas comes but once a year,
Therefore let's be jolly!"

was the jovial motto of our ancestors, and well did they carry out in practice the spirit of its exhortation. The holy Christmas morn was melodiously ushered in by bands of carollers, whose sacred ditties deserve an article to themselves. Immediately after Matin service, the "fine old English gentleman" stood at his own gate, and superintended the distribution of alms to the aged and destitute. At dawn, all his tenants were welcomed to his holly-decorated hall; the strong beer was broached, and the black jacks went plentifully about with "toast, sugar, nutmeg, and good Cheshire cheese." "The servants," writes an old author, "were then running here and there, with merry hearts and jolly countenances; every one was busy in welcoming of guests, and looked as snug as new-licked puppies. . . . Peg would scuttle about to make a toast for John, while Tom ran *harryn-scurum* to draw a jug of ale for Margery." At dinner the first dish was generally a soused boar's head,

"Crested with bays and rosemary,"

which was carried up the principal table with great state and solemnity. For this ceremony there was an appropriate carol. Dugdale, speaking of the Christmas-day observances in the Middle Temple, says, "At the first course is served in a fair and large boar's head upon a silver platter, with minstrelsy." Of the date when this practice was introduced into England, we have no certain information, but we learn from Holinshed that it was an old-established custom here, as early as the reign of Henry II. The other viands peculiar to Christmas, were the hackin, (a large sausage which the cook was required to boil before day-break under the penalty of being taken by the arms by two young men, and so hurried round the market-place till she was ashamed of her laziness), brawn, turkey, goose, capon, sirloin of beef, plum-porridge, and minced or *shred* pie. The two last, being compounded of spices, fruit, &c. were in token of the offerings of the Eastern Magi. The minced pie was shaped in imitation of the *cratch* or manger of our infant Lord. Misson, in his *Travels in England*, observes, "Every family against Christmas makes a famous pie, which they call Christmas pie. It is a great nostrum; the composition of this pastry is a most learned mixture of hens' tongues, chicken, eggs, sugar, raisins, &c." The Puritans were bitterly averse to minced pies and plum-porridge in connexion with the season. Needham, in his *History of the Rebellion*, sings:—

"All plums the prophet's sons deny,
And spice broths are too hot;
Treason's in a December pie,
And death within the pot."

We have never been witness, says Dr. Johnson in his *Life of Butler*, of animosities excited by the use of minced pies and plum-porridge, nor seen with what abhorrence those who could eat them at all other times of the year, would shrink from them in December.

We must not omit to mention here the yule dough, or dow, which the bakers used to present to their customers, in the same way that the chandlers gave Christmas candles. It was a kind of baby, or little image, in paste, probably intended for a figure of the infant Jesus; and the word is still used in the north for a little cake, though it properly means, "a mass of flour tempered with water, salt, and yeast, and kneaded fit for baking."

In the middle ages (to cite a recent journalist) the kings and leading lords, together with the colleges and inns of court, "hold their Christmas," as the phrase went, on a scale which might be called stupendous, as far as meat and drink were concerned, and attended with revels, plays, and diversions, not ceasing, in many instances, till Twelfth Night. These revels, &c. were placed under the direction of a personage who took the lead in every kind of extravagant sport and merriment which the wit of man could devise, and his election and functions were perhaps the most singular part of the festival.

"The cake was cut at hallow e'en;
And he whose lot contained the bean
Was hailed the sovereign of misrule,
And leader of the sports of Yule."

"In the feast of Christmas," says Stowe, "there was in the king's house, or wheresoever he lodged, a *lord of misrule*, or master of merry disports, and the like had ye in the house of every nobleman of honour or good worship, were he spiritual or temporal. The mayor of London and either of the sheriffs had their several lords of misrule, over contending, without quarrel or offence, who should make the rarest pastime to delight the beholders. These lords beginning their rule at All-hallows Eve, continued the same till the morrow after the feast of the Purification; in which space there were fine and subtle disguisings, masks, and mummeries." A very interesting account of the lord of misrule, as he flourished in 1585, is given by the sour precisian, Philip Stubbs. It is, however, too long for insertion here. In some great families, and also sometimes at court, this officer was called the abbot of misrule. In Scotland he was termed the abbot of unreason, and prohibited there in 1565 by the parliament. Many of the characters of whom we have elsewhere spoken as figuring in the May games, took their share in the after-dinner gambols of Christmas Day:

"Hobby-horse midst loud applause,
Came prancing on his hinder paw."

Then, too, came the "merry maskers in,"

"A strange and motley cavalcade,
St. George in arms, a prancing nag on,
Attacks a flaming scaly dragon;
Fair Sabra is preserved from death,
And the grim monster yields his breath."

* * * * *
The mumming o'er, the dancing ceased,
They share the pleasures of the feast;
And joyously the night prolong
With mirthful glee, and jest, and song."

Such is a faint outline of the manner of the festive celebration of the great holiday of the Nativity in the olden time. Some of the customs above described yet remain. Minced pies, for example, notwithstanding puritanical opposition, "still maintain a savoury remembrance in our mouths." Plum-porridge has become "solidified," under the name of pudding; and in Yorkshire, at least, it was the custom as recently as 1790 for the grocers to send to each of those who dealt with them, a pound or half-pound of currants and raisins for the concoction of this delicacy. The boar's head has long ceased to crown the Christmas board, but a relic of it is still observable

at the tables of the yeomanry, particularly of the northern parts of the kingdom; and at Queen's College, Oxford, it is retained in all its pristine dignity.¹ In Yorkshire, Staffordshire, Cornwall, and Devon, "the old spirit of Christmas," says a popular author, "seems to be kept up more earnestly than in most other counties. In Cornwall they still exhibit the old dance of St. George and the dragon. A young friend of ours happening to be at Calden-low, in the Staffordshire hills, at Christmas, in came the band of bedizened actors, and performed the whole ancient drama, personating St. George, the King of Egypt, the fair Saba, the king's daughter, the doctor, and other characters, with great energy and in rude verse. In reference to the modern secular observance of Christmas Day, the same writer observes: "In large houses are large parties, music and feasting, dancing and cards. Beautiful faces and noble forms, the most fair and accomplished of England's sons and daughters, beautify the ample firesides of aristocratic halls. Senators and judges, lawyers and clergymen, poets and philosophers, there meet in cheerful, and even sportive ease, amid the elegancies of polished life. In more old-fashioned, but substantial country abodes, old-fashioned hilarity prevails. In the farmhouse hearty spirits are met. Here are dancing and feasting too; and often blind-man's bluff, turn-trencher, and some of the simple games of the last age, remain. In all families, except the families of the poor, who seem too much forgotten at this as at other times in this refined age, there are visits paid and received; parties going out or coming in; and everywhere abound, as indispensable to the season, mince-pies, and wishes for 'a merry Christmas and a happy new year.'"

RELIGIOUS OBSERVANCES.

Albeit the religious observances of the high festival of Christmas receive but a small share of attention from old writers, they were solemnized by our "Christian sires" with great pomp and devotion. It appears from the following extract from the *Popish Kingdom*, that, as at the present time in foreign countries, they partook of a dramatic character.

"Three masses every priest doth sing upon that solemn day,
With offerings unto every one, that so the more may play.
This done, a wooden child in cloths is on the altar set,
About the which both boys and girls do dance and trimly jet,
And carols sing in praise of CHRIST; and for to help them here,
The organs answer every verse with sweet and solemn cheer;
The priests do roar aloud; and round about the parents stand,
To see the sport, and with their voice do help them and their hand."

Fosbroke states, that after the TE DEUM a stable was prepared behind the altar, and the image of the Blessed Virgin placed upon it. A boy, from above, before the choir, in the likeness of an angel, announced the Nativity to certain canons or vicars, who entered, as shepherds, through the great door of the choir, clothed in tunics and "amesses." Many boys in the vaults of the church, like angels, then began the *Gloria in Excelsis*. The shepherds, hearing this, advanced to the stable, singing, *Peace, goodwill, &c.* As soon as they entered it, two priests in dalmatics, who were stationed at the stable, said, "Whom seek ye?" The shepherds answered, "Our SAVIOUR CHRIST." The two priests then opening the curtain, exhibited the boy, saying, "The little one is here, as the prophet Isaiah said." Then they showed the mother, saying, "Behold the Virgin," &c. Upon these exhibitions they bowed and worshipped the boy, and saluted his mother. The office ended by their returning to the choir and singing Alleluia.

(1) Tradition, however, represents this usage of Queen's as a commemoration of an act of valour performed by a student of the college, who, while walking in the neighbouring forest of Shotover, and reading Aristotle, was suddenly attacked by a wild boar. The furious beast came open-mouthed upon the youth, who, however, very courageously, and with a happy presence of mind, is said to have "rammed in the volume, and cried, *Græcum est*," fairly choking the savage with the sage.

The churches, as now, were decked with laurels, holly, yew, and other evergreens. The mistletoe, however, as a heathen and profane plant, appertaining to the rites of Druidism, was never admitted into the sacred edifices, but was hung up in kitchens, subjecting every female who passed under it to a salute from any young man who was present. Christmas Day continues to be religiously celebrated in the Church of England. The streets of cities, and the thousand pathways of the country, are crowded, on its morn, by rich and poor, young and old, coming in on all sides, gathering from all quarters, to hear the "glad tidings of great joy to all people;" and each stately minster and lowly village church sends up a voice to join the mighty chorus, whose glad burthen is, "Glory to God in the highest; and on earth peace, goodwill toward men."

ON NATIONAL HOLIDAYS.

THE English are unquestionably a grave nation; there is no denying it; it is ridiculous to expect them to frisk and frolic like the Italian or the Portuguese, neither is it at all to be desired. But, if this national distinction be urged against a plea for national holidays, we venture to ask, is it usually considered good educational philosophy, to exaggerate accidental peculiarities of character by systematic training? If a child or a nation is somewhat grave, or gravish, or inclined to gravity, is it therefore to have its tendencies designedly encouraged, and to be grown into a monster of gravity, like a monstrously fat ox, or an enormously large turnip? We might as well say that spirits naturally too buoyant and excitable, are therefore not to be sobered. Surely it is the province of education rather to counteract excessive tendencies, than to be always adding fire to fire, and water to water. The Frenchman is scandalized at our severity and dulness; and we, in return, despise his vivacity. Providence intends that each should learn from the other, and give and take of their redundancies. The English are capable of lighter employments than weaving and ploughing, and, as it is sufficiently clear from the example of the wealthier classes, can occasionally be relieved from drudgery, without rushing into licentiousness.

"Your holidays will be spent at the public-house." This cannot be the true and only answer. The labouring portion of the community are not so irremediably and hopelessly bad, so incomparably worse than their "betters," as to be utterly incapable of spending a few days of leisure like Christians and reasonable beings. True, they are helpless and aimless enough. It is, we grant, the most lamentable and the most self-condemnatory feature of servitude, that it renders men, to some extent, incapable of liberty. Freedom becomes only another name for rebellion or riot. People, who never have to choose for themselves what they are next to do, will be at a loss when the choice is offered to them. They will be like the animal released from the yoke or the shafts, and which proceeds to wander, it knows not whither. But if the poor know not how to spend their time, whose fault is it? Who claim to be the directors of public morals and taste? those very persons who make this complaint of the poor. Every man who says the operative has no resource but the public-house, in the first place, says not true; and, in the second place, is bound to do all that in him lies, to the best of his light and power, to implant higher tastes, and provide material for their exercise and satisfaction. Men should act as well as talk; and every man who talks, professes thereby his power of action; but the worst and most unprofitable of all talks, is that which spends itself in mere general censures and indefinite complaints.

There are many foundations for the distribution of small sums at Christmas and other seasons. Some time since, a member got up in the House of Commons, and

suggested that, as these doles were usually spent in drinking, it would be advisable to confiscate the foundations, and apply the money to educational purposes. It would, of course, be quite as just and reasonable to confiscate the honourable gentleman's own property with the like view. We are sorry to see so prevalent a disposition to seize everything for teaching and preaching. Nothing is more untrue than these general calumnies. There are a few men in every village, and, of course, a good many more men in every town (for what is Manchester but an aggregate of five hundred Dorsetshire villages?) who are more or less likely to abuse the means of enjoyment; and but one or two in a village—much more a few hundred in a large town—will be enough to bring an ill name on popular festivities. But it is wholly contrary to our experience, that such benefactions are so perverted. Indeed, one of the most blessed and most effective foundations, we know, is a small rent charge, "Devoted to God," as it is expressed on the church tablet, and distributed, three-fourths to the maintenance of the village school, and the remainder to a Christmas dinner for every poor family in the parish. Never was so small a sum so welcome; and we may add, never so little abused as the last.

"But," say these long-headed gentlemen, "a feast is only a feast, on the most favourable supposition; and even if wife and children come in for their share, if the day is spent in nothing worse than idleness, and the stimulant portion of the banquet does not preponderate unduly over the solid food, yet it is soon over, and no one is the better for it. The time and the money are thrown away. Why not rather give what you have to give towards the permanent improvement of the poor man's condition? Instead of a few days of surfeit and senseless merriment, try to diffuse an even cheerfulness over the whole surface of the dreary year!" Nothing can be more contrary to the true philosophy of human nature. A few holidays, be they ever so far between, stand in far more stead than a monotonous tenor of well doing, though the latter may involve a greater sum total of rest from toil, and the other ingredients of temporal bliss. The mind loves a few bright spots better than a uniform flickering. Who would not rather see a mere patch of blue sky, though all else were beset with the thickest gloom, than one unbroken hemisphere of cloud refracted light? A few bright days gild the year, as the sun gilds the mountainous horizon; as the human eye lightens the whole countenance; as the skilful painter, with a few glowing tints, imparts a living and a heavenly reality to the long laboured, yet hitherto lifeless canvas. The mind requires something to look forward to, something to look back upon, something to feed the fancy as well as the present sense. It is soon palled with what it enjoys. Its greatest present happiness is to grasp nothing, but to feel itself on the way for all things. It loves what is rare and transcendent, because that seems a step to heaven. An hour or two of universal cheer; smiling faces on all sides; numberless recognitions; long looked-for meetings; bright colours; age disporting itself like youth; the momentary oblivion of all this world's hardness—these have a meaning beyond themselves; they are a foretaste of heaven. This has ever been the secret charm in what else were only dust and ashes. Weak man aspires to heaven, and humbly, yet perchance not altogether entirely, decks out a fancied semblance with a few earthly toys. This gave meaning and dignity to the games of the ancient heathen, so that even an apostle, and one who had had a glimpse of heaven, could draw from them the similitudes of a heavenly race, and a heavenly conflict, and a heavenly prize. When Virgil would portray his Elysium, he described an ordinary human festivity. His actual materials are no more than those of a village wake; so he thinks it necessary to surround them with a larger air, and a purple light, and to assign them a sun and constellations of their own. What is this but a holiday sun?

The sacred festivities of heathen antiquity were connected with all that was deep and beautiful in their philosophy and their poetry. There is a holiday hue over the whole of the Greek and most of the Roman literature. The awful tragedy, that never-ending drama of Divine Providence, in its earliest and its latest stage, was the amusement of a holiday population. The sublimest of lyric poets offended no taste or feeling of his age, when he exalted to more than human honours the triumphant pugilist or charioteer, and made their song of victory, in fact, a song of heaven. We find the best and the wisest diligently frequenting the games, and giving it as their deliberate opinion, that these celebrities were the most splendid things of earth, the brightest boons from heaven to man. Herodotus' "Nine Muses," the first and most interesting of histories, were only a series of holiday tales. Cities reckoned in rank according to the number and beauty of their festivals, which were supposed to have connexion with the national character and fortunes. Philosophers, after witnessing, with the gravest interest, spectacles that could have had in themselves but very little elegance or curiosity, sat down in their holiday attire, and with a certain holiday exuberance of genius, to discuss the highest themes of virtue, justice, and purity, and to build the most heavenly visions of human polity. The Greek citizen, indeed, seems almost to have lived a life of holiday; poor and wretched as he often was, portionless, friendless, and absolutely harmless, with scarce as much shelter to retire to, when night closed in, as the wild animals of the desert, he was still great and happy. The temples, the porticoes, the theatres, were his home. There he was, greater than king or conqueror; there he felt all the world besides to be rude and slavish. His city could not boast its vast lines of private mansions, replete with every preparation for domestic elegance and comfort; but it was one grand establishment, chiefly provided on the most economic, that is, the social principle, for the gratification of the higher tastes of the many. Of bright things, a very little will go far. They address the higher faculties, and leave lasting impressions. The thing is transient, but the idea is imperishable. An hour's, perhaps a minute's, vision of the glories of heaven, made the prophet or the apostle another man; while the bare account of it arrests the gaze of ages. The whole Christian world, with one consent, dwells and feeds upon the image. It is so with earthly things. Bareness and transience are no hindrance to the effect. Any splendid idea; an awful conflagration; a beautiful landscape; a battle; a display of fireworks; a brilliant sunset, or a great national solemnity, once seen, nay, once described, is never forgotten. It becomes ever present.¹

Biographical Sketches of Eminent Painters.

POUSSIN.

FRANCE is justly proud of Nicholas Poussin, who, though he ranks as one of the first artists of the Italian school, was born at Audelys, in Normandy, in 1594. He was descended from a noble family, but his ancestors had been ruined during the civil wars which prevailed in the reigns of Charles IX., Henry III., and Henry IV. His parents possessed but little property; nevertheless they gave him a good education.

The study of literature strengthened the talent for painting, which Poussin displayed from his boyhood; and almost every blank space in his school-books was filled with sketches suggested by his fertile imagination.

(1) From an "Essay on National Holidays," in a recent Periodical.

His first instructor was Quintin Varin, a painter of some merit; and at the age of eighteen he quitted the paternal roof, and, without assistance or friends, found his way to Paris, with the intention of following a profession which he felt to be replete with difficulties, but which he loved with enthusiasm.

On his arrival in the French capital, he was so fortunate as to form the acquaintance of a young nobleman, who, becoming much attached to him, received him into his house, and provided him with the means of obtaining further instruction.

He studied for a short time under Ferdinand Elle, who had some reputation as a portrait painter; and afterwards, for a month only, under L'Allemand; but Poussin soon discovered that neither of his instructors possessed those elevated ideas which he had conceived of the art. Some persons of science and taste now assisted him with their counsel, and lent him some engravings from the works of Raphael and Julio Romano, which he copied with great taste and correctness.

His patron, being summoned to Poitou, where his family resided, persuaded Poussin to accompany him thither, with the intention of employing him in painting at his chateau. Finding, however, that he was looked upon by his friend's relatives as a useless guest and an intruder, he determined to return to the metropolis, and abruptly quitted the house.

Having no money, he laboured hard at his art in the provinces, in order to defray the expenses of this long journey; but his exertions brought on illness, so that he was obliged to turn his steps homewards, and he remained with his friends until his health was restored. He then again repaired to Paris, where he renewed his studies with increased ardour.

His great ambition was to see Rome; accordingly he hastened to finish some pictures in which he was engaged, and commenced his journey; but he had not proceeded farther than Florence, when some circumstance—probably the want of money—compelled him to retrace his steps. Some time afterwards he made a second attempt to arrive at the goal of his anxious wishes, but again he met with obstacles which he could not overcome. He continued, therefore, to work with undiminished energy at Paris, and at length attracted the notice of connoisseurs by the execution of six pictures in fresco, which he completed in eight days.

The Cavaliere Marino, an Italian poet, was then in Paris, and he invited Poussin to accompany him to Rome. Whether he acceded to this proposal appears to be uncertain; but we find that in 1622, or, according to some writers, in 1624, Poussin was at Rome, and was introduced to Cardinal Barberini by his friend the poet, of whom, however, he was shortly afterwards bereaved by the unexpected stroke of death; and the Cardinal was, at about the same time, obliged to leave Rome, on being appointed to an ecclesiastical legation.

These two events were great drawbacks to Poussin, who, being reduced to deep distress, was compelled to sell his best works at very low prices. For a fine painting of a prophet he only obtained eight francs; and, strange to say, a young artist was paid four *écus*, or fourteen francs, for painting a copy of the same picture. Poussin, however, did not despond; he was calm in the midst of adversity, and derived consolation from the progress he was making in his art.

He does not appear to have coveted riches at any time, and throughout his life he preserved that simplicity of appearance and mode of living which he had originally adopted from necessity. Like Michael Angelo Buonarroti, Poussin worked in silence and solitude. François du Queanoy, called François le Flamand, and Alexander Algarde, both excellent sculptors, were his only intimates, and in their conversations they dwelt chiefly on the beauty of the antique.

Poussin was much indebted to the judicious observations of those able artists; he also modelled some figures in *relievo*; and the three friends reaped great benefit from their united studies of the ancient statues.

Poussin deemed it more useful to contemplate the works of the great masters than to copy them; yet, during the first years of his residence at Rome, he painted several groups of children from Titian, whose colouring he admired. He also attentively studied the best of Raphael's and Domenichino's paintings, but he devoted most of his attention to the antique statues and bas-reliefs, which he thought more worthy of critical observation than the finest efforts of modern genius in the art of painting.

The colouring of Poussin was not equal to his other artistical powers; for although, at one period, he imitated Titian in that respect, yet, when he became an enthusiastic admirer of Raphael and of the antique, he entirely altered his tone of colour, and even his management of light and shade. His historical compositions are very correct, and the air and attitudes of his figures beautiful. His landscapes are particularly pleasing, on account of the novelty and variety of the objects he has introduced in them. He possessed in an eminent degree the qualifications of invention, design, and expression, and his perspective, and the architectural accessories in his pictures, are perfect.

Several of his works painted at Rome were sent to France, some of them for Cardinal de Richelieu, minister of Louis XIII. The subjects were treated in so masterly a manner, bearing the stamp of study of the poetry and artistical superiority of the ancients, that the King of France desired M. Desnoyers, Secretary of State, to write to Poussin, making suitable offers to induce him to return to France, as one of those great artists whom the King was desirous to engage to contribute towards the perfection of the arts in his kingdom. But Poussin was reluctant to quit Rome, and it was not until Louis XIII. wrote him an autograph letter, appointing him one of his Majesty's painters in ordinary, with emoluments and advantages corresponding to that rank, that he made up his mind to leave Rome, which he promised to do in the autumn of 1639; but about the middle of December in that year he wrote to the French minister, stating that his health would not admit of his undertaking the journey at that moment: he even intimated his wish to be absolved from his engagement to go to France. But his journey was only delayed, for he took his departure from Rome after the lapse of a twelvemonth; that is to say, at the end of the year 1640; having first stipulated that he should not be bound to hold the appointment which the King of France had conferred on him beyond the period of five years.

On Poussin's arrival at Paris he was presented to Cardinal de Richelieu, who received him in the

warmest manner; and three days afterwards he was summoned to St. Germain by the King, who gave him a gracious reception, and conversed for a long time with him.

A delightful residence in the garden of the Tuileries was provided beforehand for him by the King's order; and Poussin, in a letter to his friend Carlo Antonio del Pozzo, Archbishop of Pisa, describes it as follows:—

"It is a little palace, for thus it deserves to be called, and is situated in the middle of the garden of the Tuileries. It is three storeys high, and there are nine rooms, besides the offices, which are separate from the house, and consist of a kitchen, the porter's lodge, a stable, a conservatory, &c. There is, besides, a fine large garden, well-stocked with fruit-trees, beautiful flowers, herbs and vegetables. There are also three small fountains, a well, and a handsome court-yard, in which there are also some fruit-trees. I enjoy fine views on all sides, and in summer I think it must be quite a Paradise.

"On entering I found the first-floor arranged and furnished nobly, and supplied with all kinds of provisions; there was even a large stock of firewood, and a cask of good old wine."

Poussin had already commenced his works for the gallery of the Louvre, when he found that a longer residence in Paris would be intolerable, owing to the continual cabals of his numerous rivals. He languished to return to Rome, where he had enjoyed tranquillity and freedom, and his final decision to do so was brought about by the following circumstance:—

Le Mercier, architect to the King, had commenced the compartments in the ceiling of the gallery of the Louvre, when Poussin, finding them too massive and heavy for the paintings with which he intended to embellish them, ordered that those compartments should be altered. This gave great offence to Le Mercier, and the rival painters joined him in exclaiming against whatever Poussin did. In this painful state of affairs Poussin solicited and obtained the King's permission to go to Rome, in order to settle his affairs in that city, and bring his wife to France. He left Paris about the end of September, 1642, having resided there nearly two years.

Soon after his return to Rome news arrived of the death of Cardinal de Richelieu; and Louis XIII. did not long survive his minister. Under these circumstances Poussin resolved to remain at Rome, and he firmly resisted the entreaties that were made, and the inducements which were urgently held out to him, to return to France.

He had now resided, altogether, nearly twenty years in Rome, and he lived there twenty years more in the uninterrupted exercise of his favourite art, admired by men of learning and taste, and beloved and esteemed by those whose intimacy with him enabled them to appreciate the candour and liberality of his mind.

He died on the 19th of November, 1665, in his seventy-second year, and was buried in the church of San Lorenzo, in which parish he resided. All the painters of the Academy of St. Luke, and great numbers of high personages and admirers of the arts, were present at his funeral, and a monument, with an appropriate Latin inscription, was erected to his memory by his friend, the Abbé Nicaise, a canon of the cathedral of Dijon, in France, who happened to be at Rome at the time of his death.

Poussin left his property, which did not amount to more than about fifty thousand francs, or two thousand pounds sterling, to be divided amongst his own and his deceased wife's relatives. He might have amassed riches by the product of the number and excellence of his works, but he was so disinterested, that having once fixed a reasonable price for painting his pictures, he invariably declined to accept the additional sums which were pressed upon him after their completion, as marks of the high satisfaction of those who had engaged him to paint them.

It may therefore be truly said of Poussin, that he loved painting for itself, more than for the renown and the profit which he derived from it. His wife had no fortune; he married her from affection, and gratitude for her kindness towards him during a severe illness, by which he was attacked whilst lodging in her father's house, in France. They had no children, and they always lived happily together, without any display. Poussin had a decided objection to keeping a number of servants, and the following anecdote is related by his biographers.

Cardinal Massini having called upon him one day, the time passed so rapidly in conversation, that the visitor remained until after dark. On taking his leave there was no one to conduct him to the door but Poussin himself, who carried a light. The cardinal said that he pitied him, because he had no man-servant.

"And I," replied Poussin, "pity you, my Lord, much more, because you have so many domestics."

Although Poussin's paintings may be estimated at more than three hundred in number, he was not assisted in the execution of any of them. Amongst his most celebrated pictures, we may mention Germanicus, The taking of Jerusalem, Rebecca at the Well, Moses striking the Rock, The Adoration of the Golden Calf, The Conversion of St. Paul, The Will of Endamidas, numerous landscapes, which he enriched with historical subjects, and four pictures representing the Seasons, each containing a scriptural subject. Spring represents Adam and Eve in Paradise; Summer, Ruth in the fields of Boaz; Autumn, the two Israelites who went by order of Moses to "spy out the land of Canaan," returning with a vine branch laden with an enormous cluster of grapes, which they carry on a staff resting on their shoulders; and Winter is designated by the Deluge. The latter was the last picture painted by Poussin, and, although his powerful genius is manifested in the grandeur of the general effect, some marks of the feebleness of his hand are also visible.

His brother-in-law, Gaspar Poussin, was his only pupil. The real name of the latter was Gaspar Dughet, and he was born in France in 1600. He was induced to travel to Rome, partly from a strong desire to see his sister, who was married to Poussin, and partly from a love for the art of painting, for which he had a great genius. Whilst at Rome he changed his name for that of his kind instructor, and he is known by no other name than that of Gaspar Poussin. His landscapes are beautiful, but his figures are but indifferently designed; of this he was so conscious, that he frequently prevailed upon his brother-in-law to paint his figures for him.

THE CHRISTMAS CAROL.¹

"Then came the merry maskers in,
And carols roared with blithesome din;
If unmelodious was the song,
It was a hearty note and strong."

SIR WALTER SCOTT.

THE word "carol" is said to be derived from the Latin *cantare*, to sing, and *rola*, an interjection of joy. By some writers, however, it is supposed to be of Italian, and by others of French, extraction; its meaning is, generally, a song of mirth and exultation, especially of religious joy. The "Christmas Carol," in particular, is a song in celebration of our blessed Lord's nativity. This kind of pious ballad is undoubtedly of very remote origin. Bishop Jeremy Taylor, in his *Great Exemplar*, fancifully remarks that the first Christmas carol was the Hymn of the Angels to the Shepherds in the plains of Bethlehem:—"Glory to God in the highest, on earth peace, good will to men." Milton also, in *Paradise Lost*, thus mentions the same anthem:

"His place of birth a solemn angel tells
To simple shepherds keeping watch by night;
They gladly thither haste, and by a quire
Of squadron'd angels hear His carol sung."

This hymn was introduced at an early period into the services of the Church, being sung either at Morning Prayer, or in the Communion Office, or before the Lessons on Christmas Day. In process of time, other hymns of the same kind appear to have been formed after its example; and it is stated by the celebrated ritualist Durandus, that anciently bishops were accustomed, on the above festival, to "sing carols among their clergy" in the cathedrals.

In a Latin poem, written about the middle of the fifteenth century, and soon after translated into English, the following allusion to the practice of carolling in church at Christmas occurs:—

"A wooden child is on the altar set,
About the which both boys and girls do dance and trimly jet;
And carols sing in praise of CHRIST, and for to help them here
The organs answer every verse with sweet and solemn cheer."

The "Christmas carol," however, was not confined to the Church offices in mediæval times. "It has been the custom," says a modern writer, "for the common people of England for many centuries to go about in bands, at an early hour on Christmas morn, serenading their neighbours with what are called 'carols.'" Such also was the usage in other parts of Christendom. "During the season of Advent," remarks Mr. Digby, "the waits, while other men took their rest, wandered, singing hymns in the streets; and on the blessed night, every one kept watch like the shepherds, while minstrels chanted Christmas carols." In these ancient poems the inhabitants of each town and village used to be represented making the offering of whatever best object they possessed to the infant Saviour and the blessed Mother. These ditties even gladdened the festivals of royalty. Henry VII., in the third year of his reign, kept his Christmas at Greenwich: on the twelfth night, after high mass, the king went to the hall, and kept his estate at the table; in the middle sat the dean and those of the king's chapel, who, immediately after his majesty's first course, "sang a caroll." The earliest collection of Christmas carols supposed to have been published, is only known from the last leaf of a volume, printed by Wynkyn de Worde in 1521. "These," says Brand, "were festal chansons for enlivening the merriments of the Christmas celebrity; and not such religious songs as are current at this day with the common people, under the same title, and which were substituted by

those enemies of innocent and useful mirth, the Puritans." We differ from the above antiquary in reference to the puritanical origin of the "religious" Christmas carols "current at this day." Many of them appear to be even of earlier date than the Reformation; and, since the Puritans, as is well known, hated Christmas Day as Popish and anti-Christian, and abolished its observance wherever their influence extended, it is most improbable that they should have composed songs for its celebration. Be this as it may, the majority of the mediæval Christmas carols were "religious." Some of these, in a more or less interpolated and modernized state, have been handed down to us, and though, perhaps, wanting in interest to a refined mind, are sometimes admirable for their simplicity and tenderness. Take for example the ensuing stanzas from that quaint old ditty, beginning,

"Joseph was an old man, an old man was he,
And he married Mary, Queen of Galilee,"

which was sung by companies of little children at Christmas, and which "brings fairly before us the paintings of the old masters, where Joseph is always represented as so old a man, and Mary sits in the oxen's stall with her crown on her head."

"As Joseph was a'walking, he heard an angel sing—
'This night shall be born our heavenly king;
He neither shall be born in houses nor in hall,
Nor in the place of Paradise, but in an ox's stall;
He neither shall be clothed in purple nor in pall,
But all in fine linen, as were babies all;
He neither shall be rock'd in silver nor in gold,
But in a wooden cradle that rocks on the mould;
He neither shall be christen'd in white wine or in red,
But with the spring water with which we were christen'd."

How sweet, again, are the following lines, which enrich another antique carol:

"O fair, O fair Jerusalem! when shall I come to thee,
When shall our griefs be at an end? Thy joys when shall we see?
The fields were green as green might be, when, from His glorious seat,
The Lord our God He watered us with His heavenly dew so sweet."

These words could only have been written by one fully conversant with the ritual of the Western Church. They are adapted from her Advent service. Very melodious to our ears is the rhythm of the carol beginning with—"I saw three ships come sailing on," and containing the verses which follow:

"And all the bells on earth shall ring,
On Christmas-day, on Christmas-day;
And all the bells on earth shall ring,
On Christmas-day in the morning.

And all the angels in heaven shall sing,
On Christmas-day, on Christmas-day;
And all the angels in heaven shall sing,
On Christmas-day in the morning.

And all the souls on earth shall sing,
On Christmas-day, on Christmas-day;
And all the souls on earth shall sing,
On Christmas-day in the morning."

Our space will not admit of our giving to our readers any more specimens of the simple Christmas carols which animated the devotion of our pious ancestors. We will now offer a few remarks on those early "feste-chansons" which were merely intended to be incitements to Christmas revelry. Perhaps the most interesting of those extant is an Anglo-Norman carol of the thirteenth century. It is too long for insertion here, but it gives a very interesting picture of the gaiety and kindly feeling which the festival of the Nativity appears to have excited among all classes, and dwells with much

(1) This paper is intended to form part of a volume on Christmas and Christmas Carols, with Engravings, just publishing by Mr. Sharpe, the publisher of this Magazine.

satisfaction on the long list of Christmas dainties, and the profusion of rich wines. Another of these secular carols was discovered in a MS. of the time of Henry VI. The song itself, however, from the style and spelling, may be assigned to a century earlier. "It seems," says Miss Lawrence, "to be sung in the week before Christmas, when the household maidens all busied themselves with dressing up the halls and chambers with evergreens. The great hostility expressed towards ivy may be accounted for by the circumstance of its being used at funerals." A few lines of this carol in modern orthography may not be uninteresting here:—

"Nay, Ivy! nay, it shall not be, I wis;
Let Holly have the mastery, as the manner is;
Let Holly stand within the hall, fair to behold;
Let Ivy stand without the door; she is full sore a-cold.
Nay, Ivy! &c.

Holly and his merry men deftly dance and sing;
Ivy and her maidens are alway sorrowing.
Nay, Ivy! &c.

Holly hath berries, is red as any rose,
Gay-looking to the hunter, as through the wood he goes;
Ivy, too, hath berries, but black as any sloe;
Thither come the owls, and eat them as they go.
Nay, Ivy! &c.

The Reformation did not impair the popularity of the Christmas carol in England. A writer in 1631, in his description of a good and hospitable housekeeper, has left the following picture of Christmas festivities: "Suppose," he says, "Christmas now approaching; the evergreen ivy trimming and adorning the portals and particloases of so frequented a building; the usual carols, to observe antiquity, cheerfully sounding; and that which is the complement of his inferior comforts, his neighbours, whom he tenders as members of his own family, join with him in this consort of mirth and melody." At the end of a "Miscellany of Epigrams, &c." published about the same period, is a "Christmas carol," which contains a recital of the pastimes in vogue at that season. This, and similar compositions of the seventeenth century, make, however, no pretension to any religious character; but, in the mean time, others also, of a devotional strain, were in general use. Wharton mentions a license, granted to one Tysdale in 1562, for printing "certain goodly carols to be sung to the glory of God;" and again, "Christmas carols authorized by my lord of London." Bishop Andrewes, in one of his sermons on the Nativity, preached on the twenty-fifth of December, 1619, celebrates the day as "glorious in all places, as well at home with carols as in the church with anthems." From the time of the famous prelate just mentioned to our own, the practice of singing Christmas carols in this kingdom has been preserved; "varying probably in circumstances and degree, but dispersed, more or less, over the different parts of the country." In Heath's *Account of the Scilly Islands*, he says that it is usual there to sing carols on Christmas Day at church. Dr. Goldsmith, in his *Vicar of Wakefield*, writing about 1763, and "laying the scene of his narrative at a small cure in the north of England," relates that, among other customs which they retained, the inhabitants "kept up the Christmas carol." Brand, in 1795, remarks, that little troops of boys and girls, at Newcastle-upon-Tyne, and other places in the north of England, "go from house to house, knocking at the doors, singing their Christmas carols, and wishing a happy new-year." A writer in 1811, describing the manner in which the inhabitants of the North Riding of Yorkshire celebrate Christmas, observes, "About six o'clock on Christmas day I was awakened by a sweet singing under my window; surprised at a visit so early and unexpected, I arose; and looking out of the window, I beheld six young women and four men, welcoming with sweet music the blessed morn."
"Carols," writes Mr. Hone, in 1825, "begin to be spoken

of as not belonging to this century, and few perhaps are aware of the number of these now printed." He adds that he possesses "upwards of ninety, all at this time published annually." Mr. Howitt, in 1838, remarks, that the Christmas carols which were sung about from door to door, for a week at least, not twenty years ago, are rarely heard now in the midland counties. More northward, from the hills of Derbyshire, and the bordering ones of Staffordshire, up through Lancashire, Yorkshire, Northumberland, and Durham, you may frequently meet with them. The custom of Christmas carolling prevails in Ireland to the present time. In Scotland it is unknown. In Wales it is still preserved, to a greater extent, perhaps, than in England. After the turn of midnight on Christmas-eve, Divine service is celebrated, followed by the singing of carols to the harp; and they are similarly sung in the houses during the continuance of the Christmas holidays.

J. F. R.

SYMPATHY FOR THE POOR.

THE delicacies of food and clothing are enjoyed with little concern for those to whom the necessities of life are scarcely attainable; and it has thus passed into a proverb, that one half of the world knows not what becomes of the other. One of our first moral writers has been pleased to speak in a manner somewhat disrespectful of those moralists and poets, like Thomson, who have noticed and lamented this disposition in the human mind to enjoy its own blessings rather than disquiet itself with the calamities of others. I allude to Adam Smith. But was he well employed on this occasion? It is the province of sympathy to render us alive to the evils of those around us. This he would admit. So is it equally the province of reason and good sense to save the mind from too deep an interest in afflictions which we can neither prevent nor remedy. This we concede on our part. No doubt, therefore, it is the perfection of the human character to be at once equal to its own happiness, and yet sensible to those miseries of our fellow-creatures which its exertions can alleviate. But surely it remains to be remarked, that it is not in any deficiency to ourselves that human nature offends. This is not the weakness of mankind, or the aspect under which they need be regarded by a moralist with any pain. If there be sometimes found those who are formed of a finer clay, so as really to have the comforts of their own existence diminished and interrupted by sympathizing too long and too quickly with the calamities of those around them, such may surely be considered as exceptions, to be set apart from their fellow-mortals, as those more amiable beings, who are not likely by their example to injure the general cause of reasonable enjoyment in the world; and whom the more natural prevalence of careless selfishness renders it not easy often to find, and surely not very possible long to censure.—*Smith's Lectures on History.*

HOLYROOD.

"THE moonlight fell like pity o'er the walls
And broken arches, which the conqueror, Time,
Had rode unto destruction; the grey moss,
A silver cloak, hung lightly o'er the ruins;
And nothing came upon the soul but soft
Sad images. And this was once a palace,
Where the rich viol answered to the lute,
And maidens flung the flowers from their hair
Till the halls swam with perfume: here the dance
Kept time with light harps, and yet lighter feet;
And here the beautiful Mary kept her court,
Where sighs and smiles made her regality,
And dreamed not of the long and many years
When the heart was to waste itself away
In hope, whose anxiousness was as a curse:
Here, royal in her beauty and her power,
The prison and the scaffold, could they be
But things whose very name was not for her?
And this now fallen sanctuary, how oft
Have hymns and incense made it holiness!
How oft, perhaps, at the low midnight hour,
Its once fair mistress may have stolen to pour
At its pure altar, thoughts which have no vent

But deep and silent prayer; when the heart finds
That it may not suffice unto itself,
But seeks communion with that other state,
Whose mystery to it is as a shroud
In which it may conceal its strife of thought,
And find repose.
* * * * * But it is utterly changed:
No incense rises, save some chance wild flower
Breathes grateful to the air; no hymn is heard.
No sound, but the bat's melancholy wings;
And all is desolate and solitude.
And thus it is with links of destiny
Clay fastens on with gold, and none may tell
What the chain's next unravelling will be.
Alas! the mockeries in which Fate delights!
Alas! for time!—still more, alas for change!"

L. B. L.; in the *Literary Gazette*.

HOLYROOD, or the Abbey of Holyrood House, is the patriarchal antiquarian pile of Edinburgh. It was, however, founded some three centuries subsequent to the fair city. Simon of Durham mentions the town of Edwinesburgh as existing in the middle of the eighth century; and, in the charter of the foundation of the

Abbey of Holyrood, in the year 1128, King David I., called it his burgh of Edwinesburg, whence we may infer it was then a royal burgh.

The founding of the Abbey is due to the piety and prodigality of David, whose liberality to the clergy drew from one of his successors the pithy observation, that he was "a sair sanct for the crown." The legendary origin of the building is thus related: "David, while hunting in the forest of Drumsheuch, was placed in the utmost peril by the attack of a stag. When defending himself from his assailant, a cross miraculously descended from heaven into his hand, upon seeing which the stag fled in dismay." The sequel is more credible. In a dream which visited the slumbers of the monarch, he was commanded to erect an abbey on the spot of his remarkable preservation; and, in obedience to the mandate, he founded the Abbey of Holyrood House, for a class of religious men, called the Canons Regular of St. Augustine, on whom, at the same time, many privileges and much land were bestowed. Among other benefits they were allowed to erect a borough between the town of Edinburgh and the Church of Holyrood House; and the long street, called the Canongate, at Edinburgh, is the remainder of this borough. Succeeding monarchs bestowed many additional gifts upon this order, and it soon became one of the richest establishments in Scotland. Among David's provisions were some strongly tinged with the superstition of the times: they included a right to the trial by combat, and to the water and fire ordeals; and, besides these privileges, the canons had the right of finding out "noted witches and warlocks," and of determining controversies of every kind; and their Abbey furnished an asylum to the guilty, whom it was accounted sacrilege to follow, except in the case of murder. Part of the locality is privileged to this day, the precincts of the Abbey being a sanctuary for insolvent debtors.

Holy Rood, we may mention, is synonymous with Holy Cross: it was usually placed over the screen which divided the nave from the chancel of our churches. To our ancestors, we are told, it conveyed a fall type of the Christian Church: the nave representing the Church militant, and the chancel the Church triumphant; denoting that all who would go from the one to the other, must pass under the Rood; that is, carry the Cross, and suffer affliction. Most of the Roods were taken down in 1547; but several remained till late in the reign of Queen Elizabeth.

In the year 1177, a National Council was held in the Abbey, at Holyrood, in consequence of a dispute between the English and Scottish clergy, as to the submission of the latter to the Church of England; a legate having been sent by the Pope to take cognizance of it. In 1332, the building was stripped and spoiled in Baliol's conquest of Scotland, under Edward III.; and in 1385, it suffered similarly, under Richard II. In 1457, Archibald Crawford, Lord High Treasurer of Scotland, was appointed Abbot of Holyrood; and he rebuilt the Abbey in the architectural style of his period, thus substituting the Pointed for the Norman employed by the royal founder, David I.

For about four centuries, the establishment flourished as an abbey; and, during the latter part of that period, it was the residence of the sovereign. In the year 1528, James V. added a palace to the conventual buildings: a portion of this palace remains to the present day, and consists of the towers of the north-west angle of the quadrangular court.

Returning to the monastic history of the place, we find that, when the Earl of Hertford entered Scotland, in 1544, the Abbey was almost entirely burnt by his soldiers; the choir and transept of the church being destroyed, and nothing preserved but the nave. It was then that Sir Richard Lea, Captain of the English Pioneers, carried off the brazen font, in which the children of the royal family had been usually baptized: he presented it to the church of St. Alban's, in Hertford-

shire, and commemorated the event in the following inscription:—

"When Leith, a town of good account in Scotland, And Edinburgh, the principal city of that nation, was on fire, Sir Richard Lea, Kt., saved me out of the flames, and brought me into England.

In gratitude to him for his kindness
I, who, heretofore, served only at the baptism of the children
of kings,

Do now most willingly offer the same service
Even to the meanest of the English nation.

Lea! the conqueror, hath so commanded.

Adieu! A.D. 1543, in the 36th year of King Henry VIII."

But this record of the pride of conquest did not remain any time in its new location; for, during the Civil Wars, it fell into the hands of the regicides, and was sold by them as old metal, and melted down.

In 1547, after the sanguinary battle of Pinkie, the monks made their escape from Holyrood; and the victorious English under the Earl of Hertford stripped the church and palace of the lead roofing, and carried off the bells.

At the Reformation, the monastery was dissolved; its revenues then amounting, in money, to 250 l. sterling, annually, and in kind to 442 bolls of wheat, 640 bolls of bear, 560 bolls of oats, 500 capons, 20 dozen of hens, 2 dozen of salmon, 12 loads of salt, and of swine a number not precisely ascertained.

In the great spoliation, the fine church was stripped of its valuables: from a mistaken principle of religious zeal and devotion, the earl of Glencairn laid waste the sacred building, and broke into pieces its sculptures and costly furniture. The chapel was, however, entirely refitted by James the Seventh, of Scotland; by whose order the floor was paved with marble, sculptured and painted with shields and armorial devices; the king also erected a magnificent throne, and twelve stalls for the knights companions of the order of St. Andrew. There was likewise constructed a large and finely toned organ; and workmen were sent from London, with orders to set up the figures of the twelve apostles in as many niches on one side of the interior, and a corresponding number of prophets on the other. This design was violently opposed by the populace, who alleged that the king intended to establish popish rites and ceremonies, and that these statues were intended as objects of adoration: consequently, the whole of the workmanship was defaced, and the artisans were compelled to desist from their undertaking.

At the restoration, Charles the Second completely repaired the church, and ordained that it should be in future set apart as a chapel royal to the palace, and be no longer the parochial church of the Canongate. It was, therefore, refitted with great splendour; a throne was erected for the king, and twelve stalls for the knights of the Order of the Thistle. Unfortunately, the organ which James had placed there was not removed, and this, coupled with the belief that mass had been celebrated in the chapel, rendered it so obnoxious to the Presbyterians, that, at the Revolution, a lawless mob broke in and stripped the church of all its internal decorations. Fanatical zeal and political apostasy went further. They violated the sacred habitations of the dead; they profaned the sepulchre of their kings; they outraged its sanctity by tearing open the coffins that contained the mouldering ashes of James the Fifth; of Magdalen of France, his first Queen; of the Earl of Darnley, once their monarch; and others who had held the Scottish sceptre. They sold the lead of which the coffins were made, and left the bodies exposed, an unseemly spectacle, and the degrading memorial of popular frenzy.

The walls of the church, which thus withstood the fury of the mob, have since been brought to the ground by the unskilfulness of an architect in replacing the old roof by a heavier one of flag-stones. This was done in 1758: the walls were already upwards of six hundred

years old, but they bore their new weight until 1768, when the whole came to the ground. Arnot, in his *History of Edinburgh*, published in 1788, thus describes the effect of the catastrophe: "When we lately visited the spot, we saw, in the middle of the chapel, the broken shafts of the columns, which had been borne down by the weight of the roof. Upon looking into the vaults, the doors of which were open, we found, that what had escaped the fury of the mob at the revolution, became a prey to the rapacity of those who ransacked the church after it fell. In 1776, we had seen the body of James the Fifth and some others in the leaden coffins; the coffins were now stolen, the head of Queen Magdalene, which was then entire, and even beautiful, and the skull of Darnley, were also stolen; his thigh-bones, however, still remain, and are proofs of the vastness of his stature."

The chapel at Holyrood was, in its pristine state, a magnificent structure, in the pointed style of architecture; its west front has been compared with Melrose Abbey, Ely and York cathedrals. The highly-enriched windows which lighted the rood-loft are much admired; the columns, mouldings, and sculptures of the west door are executed in a very bold style. Immediately above the door is a small square stone bearing this inscription:

HE SHALL BUILD ANE HOUSE
FOR MY NAME, AND I WILL
ESTABLISH HIS THRONE
FOR EVER.
BASILLICAM HANO RMI
RECTAM CAROLUS REX,
OPTIM ET RESTAURAVIT
ANNO DOM
CIO.DCCXXXIII.

The north side of the ruinous pile still has its ornamental buttresses, enriched with canopied niches and pinnacles: this was the work of Abbot Crawford, in the reign of James the Third. The south side is likewise adorned with buttresses, but differing from those on the north. At the east end is the great window, shown in one of our illustrations: its mullions were greatly damaged by a storm in 1795, but they were restored in 1816, with the materials found about the chapel. In this illustration, too, are shown some of the finely sculptured capitals, clustered columns and arches, the smaller decorated arches of the triforium, the pinnacle of one of the buttresses, and the broken shafts, in massive ruin, set off by the light streaming through the open stories and mullions of the great window. We should not omit to mention, that at the north-west corner of the chapel is the belfry, a small tower, which contains a marble monument and statue of Robert Lord Belhaven, who died in 1639.

Almost immediately adjoining the chapel ruins is the palace of Holyrood, a handsome quadrangular building, with a central court, ninety-four feet square; its front is flanked with double castellated towers, "imparting to the edifice that military character which the events of Scottish history have so often proved to have been requisite in her royal residences." A great part of this palace was burnt by the English in 1544, but it was soon rebuilt on a more extensive scale; a large portion of this structure was, however, burnt to the ground by Cromwell's soldiers; it lay in ruins until 1670, when, by direction of Charles II., the present palace was commenced, after a design by Sir William Bruce.

Around the interior of the quadrangle extends an arcade. The largest apartment is the picture gallery, 150 feet long by twenty-seven broad; upon the walls of which are suspended the portraits of 106 Scottish kings, as Humphrey Clinker says, "mostly by the same hand, painted either from the imagination, or porters hired to sit for the purpose." In the olden time many a scene of courtly gaiety has enlivened this gloomy hall; among the last were the balls given by Prince Charles Edward,

in 1745. The election of the representative peers of Scotland is now the only ceremony performed within its walls. In the south side of the quadrangle is the hall of state, fitted up for the levées of George IV. in 1822; and in the eastern side is the suite of apartments occupied by Charles X. (of France) and his family in 1830-3. The palace is shown to strangers by the domestics of the Duke of Hamilton, hereditary keeper.

The north-west portion is all that remains of the palace of James V. The most interesting relic is the bed of Queen Mary, which remains in the same state as when last occupied by that unhappy princess. The closet where the murderers of Rizzio surprised their victim, is also shown; as also the trap-door by which they ascended, and dark stains on the floor, stated to be the marks of Rizzio's blood.

Holyrood is, of course, one of the most attractive curiosities of the city of Edinburgh, and is visited by thousands of persons annually. Mrs. Sigourney thus apostrophises it.

"Old Holyrood! Edina's pride,
Where erst, in regal state array'd,
The mitred abbots told their beads,
And chaunted 'neath their hallow'd shade.
And nobles in thy palace courts
Revel, and dance, and pageant led,
And trump to tilt and tourney call'd,
And royal hands the banquet spread.
A lingering beauty still is thine,
Though age on age have o'er thee roll'd
Since good King David reared thy walls,
With turrets proud and tracery bold.
And still the Norman's pointed arch,
Its interlacing blends sublime
With Gothic column's clustered strength,
Where foliage starts, and roses climb."

Mrs. Sigourney's visit is pleasantly detailed. "The first view of Holyrood," says the poetess, "is in strong contrast with the splendid buildings and classic columns of the Calton Hill. After admiring the monuments of Dugald Stewart, and Nelson, and the fine edifice of the High-school, you look down at the extremity of the Canongate upon the old palace, that, seated at the foot of Salisbury Craig, nurses, in comparative desolation, the memories of the past. Its chapel, floored with tombstones, and open to the winds of heaven, admonishes human power and pride of their alliance with vanity."

"Through an iron gate we saw, in a damp miserable vault, the bones of some of the kings of Scotland; among them those of Henry Darnley, without even the covering of that 'little charity of earth' which the homeless beggar finds. In another part of the royal chapel, unmarked by any inscription, are the remains of the lovely young queen, Magdalene, daughter of Francis I. of France, who survived but a short time her marriage with James V. In the same vicinity sleep two infant princes named Arthur; one the son of him who fell at Flodden Field, the other a brother of Mary of Scotland. Scarcely a single monument, deserving notice as a work of art, is to be found at Holyrood, except that of Viscount Belhaven, a privy councillor of Charles I. who died in 1639. He is commemorated by a statue of Parian marble, which is in singular contrast with the rough black walls of the ruinous tower where it is placed. It has a diffuse and elaborate inscription, setting forth that 'Nature supplied his mind by wisdom, for what was wanting in his education; that he would easily get angry, and as easily, while speaking, grow calm; and that he enjoyed the sweetest society in his only wife, N. Murray, daughter of the Baron of Abercromby, who died in eighteen months after her marriage.'"

(1) It is contended by Miss Strickland, in the last published volume of her "Lives of the Queens of England," that the common belief regarding this bed is a mistake; that it was the bed, not of Mary Queen of Scots, but of Mary Beatrix, queen of James II. of England.—*Editor.*

"The grave of Rizzio is pointed out under one of the passages to a piazza, covered with a flat stone. Over the mantel-piece of the narrow closet, where, from his last fatal supper, he was torn forth by the conspirators, is a portrait, said to be of him. Its authenticity is exceedingly doubtful; yet it has been honoured by one of the beautiful effusions of Mrs. Hemans, written during her visit to Holyrood in 1829:—

'They haunt me still—those calm, pure, holy eyes!
Their piercing sweetness wanders through my dreams;
The soul of music that within them lies
Comes o'er my soul in soft and sudden gleams.
Life, spirit—life immortal and divine—
Is there; and yet, how dark a death was thine!'

"We found ourselves attracted to make repeated visits to Holyrood; and never, on these occasions, omitting its roofless chapel, so rich in recollections. It required, however, a strong effort of imagination to array it in the royal splendour with which the nuptials of Queen Mary were there solemnized, and, seventy years after, the coronation of her grandson, Charles the First. The procession, the ringing of bells, the gay tapestry streaming from the windows of the city; the rich costumes of the barons, bishops, and other nobility; the king, in his robes of crimson velvet, attending devoutly to the sacred services of the day, receiving the oaths of allegiance, or scattering, through his almoner, broad pieces of gold among the people, are detailed with minuteness and delight by the Scottish chronicles of

that period. 'Because this was the most glorious and manifique coronation that ever was seen in this kingdom,' says Sir James Balfour, 'and the first king of Great Britain that ever was crowned in Scotland, to behold these triumphs and ceremonies, many strangers of greater quality resorted hither from divers countries.'

"Who can muse at Holyrood without retracing the disastrous fortunes of the House of Stuart, whose images seem to glide from among the ruined arches where they once held dominion? James the First was a prisoner through the whole of his early life, and died under the assassin's steel. James the Second was destroyed by the bursting of one of his own cannons at Roxburgh. James the Third was defeated in battle by rebels headed by his own son, and afterwards assassinated. James the Fourth fell with the flower of his army at Flodden Field, and failed even of the rites of sepulchre. James the Fifth died of grief, in the prime of life, at the moment of the birth of his daughter, who after twenty years of imprisonment in England, was condemned to the scaffold. James the First of England, though apparently more fortunate than his ancestors, was menaced by conspiracy, suffered the loss of his eldest son, and saw his daughter a crownless queen. Charles the First had his head struck off in front of his own palace. Charles the Second was compelled to fly from his country, and, after twelve years banishment, returned to an inglorious reign. James the Second abdicated his throne, lost three kingdoms, died in exile, and was the last of his race who inhabited the palace of Holyrood."

A CHRISTMAS PARTY IN THE COUNTRY.

CHAP. IV.

A WINTER'S WALK AND EVENING TALK.

Who has not felt the invigorating influence of a clear frosty morning, after many days of incessant snow, when the sun once more shines forth, and its beams are welcomed by a thousand smiles sparkling from innumerable crystals? The scene then presented has been again and again likened to fairy-land, and still, when it recurs, it ever brings the same idea. The trees all clothed in one robe of white, yet presenting a variety of fantastic shapes; the sycamore, shooting out its slight

ramifications; the oak, stretching forth its gnarled arms; the elm, presenting its ponderous branches; the ash, still retaining its bunches of keys or seed vessels, on which the snow lodges in clumps; and the slender birch, with its pensive twigs falling around like the most delicate filagree; all look the work of enchantment; whilst even those natural productions least attractive to the eye in a simple state, glitter in borrowed beauty; every straw looks like a tiny sceptre studded with jewels; and

a row of winter greens transports us to Aladdin's garden, where each plant appears an enormous emerald, covered by a profusion of small but precious brilliants. Nor is the change wrought by the frost less perceptible in the animated part of creation; the shepherd crosses the track with a brisker step, and his dog gambols beside him with a more lively bound, every now and then starting forward and rolling in the snow; the cattle hasten less heavily to the farm-yard, and low forth their expectations of fresh fodder; the pigeons assemble on the sunny side of the dovecote, plume their wings, and close their gentle eyes with an air of enjoyment, occasionally expressed by a low half-suppressed cooing; the old horse winneys cheerfully from the stable, as it hears the labourer's tread; the maids have a laugh as well as a frown when they find the pump-handle resist all their efforts to move it; but a remedy is at hand where the heavy log is piled upon the kitchen fire, and the hissing kettle joins its merry chorus to the renewed vivacity around. The bright sunshine penetrates through the house, and in breakfast-room as well as hall its influence is felt. So it was at Kirkfield, as each member of the party entered the saloon, uttering in various tone,—"O, what a cold morning!" rubbing their hands, and crowding round the blazing fire.

"We shall get out again, at last," said Charles Loraine; "though I fear the depth of snow is against another trial of the low-closes, so we must devise some other scheme. What think you of a ramble, Justine? have you plenty of furs and strong shoes to guard you against an adventure?"

"I doubt my cousin's chausure is not altogether suited to the country," remarked Sophia; "but we can supply her with snow-boots, and then I hope she may be induced to venture."

"Suppose we form a party of pioneers," proposed Cyril, "and clear the path along the terrace?"

"Quite right; no task could be better suited to warm us; so come along this very moment. Run, Neville, to muster all the spades and brooms you can find, and before noon we shall have cleared a way to the vicarage, and then we can help to dig out the Forsters, if they are buried in this snow-storm. We shall find Charlotte manufacturing flannel petticoats, and Alice chirping like a cricket in the chimney-corner.—Fred, I shall have to teach you how to handle a spade, I suppose.—I hope you will not be very stupid; your character will depend greatly upon your exertions, for I heard Lucy quoting the other day somebody's sage observation, that 'vigour of mind in a healthy frame is always accompanied by vigour of body.' I believe it was intended as a compliment to myself, for I was chasing little Laura round the room at the time."

"And therefore your self-love has retained the remark, Master Charles!"

The implements were soon procured, and the young men plied them so diligently, that at luncheon-time they returned with the news that the vicarage was unburied, and invited the girls to accompany them thither. Cloaks, shawls, boas, and snow-boots, were quickly sought for; and all, except Rosaline, who was thought too delicate to encounter the blast, were soon mounting the slope of the terrace, and enjoying the exhilarating effects of the keen air. Laura Barlow and Agnes had little more self-command than Dash, and exhibited their exuberant spirits pretty much in the same manner, bounding out of the path, now to catch a view of the snow-covered hills, now to mark an effect of light and shade, and now to see if a favourite harbour or summer-temple had resisted the storm uninjured. At length Charles caught the infection of their mirth, and challenged them to a race, by which they reached the lodge before the rest of the party, and poured out to old Emma a torrent of inquiry after the villagers.

So large a party nearly filled the pretty little parlour of the vicarage; and, if the Forsters were glad to see them, the Loraines were no less pleased to recognise an

unexpected guest there. At a table, loaded with books and papers, sat the good vicar, pen in hand, his eldest daughter, by his side, patiently turning over his references for him; and, when not required at this literary labour, if not exactly working, as Charles had predicted, at flannel-petticoats, certainly making some article of useful clothing for the poor. Her sister Alice was busily rolling up parcels of similar articles, assisted by a tall lovely girl in deep mourning, who was carolling forth a Scotch ballad, and whom Sophia and Lucy delightedly welcomed as Margaret Campbell.

"You really and truly are a Maid of the Mist, Miss Campbell!" exclaimed Charles; "a real Scottish witch,—for you could only have alighted here from off a broomstick,—the roads being impassable for every other vehicle. Pray show me your steed, for our English broomsticks are not so accommodating; and I can assure you we have had to wield them with no little toil in order to win our way hither."

"Charles is determined not to have his labours overlooked, though the credit of the plan is Cyril's," whispered Lucy to Charlotte Forster; "but tell me, when did Margaret arrive?"

"The very night before the storm set in. Her uncle having business, which called him unexpectedly to London, she wisely took advantage of his escort to pay her promised visit to us now, instead of in the spring; sure to find us at home, and, I trust, likely to be benefited by the change of scene."

"Poor girl; I heard her voice—sweet as ever—when we entered the room; but there is a shadow over her bright eyes, a change in her light step, to tell us of the trials she has undergone since we last saw her!—Father, mother, and an only brother!—Death has indeed made fearful inroads in her family!"

"Deeply has poor Margaret felt these strokes, yet she bears up under them with the same cheerful spirit which ever marked her under lighter trials. In prosperity she acknowledged this spirit as a gift from God, and now she finds that the possessor of this, as of every gift from above, will be called upon to exercise it in submission to His will."

In the meantime Miss Campbell received the welcome of her friends, and was introduced to the rest of the party, Justine and Frederic l'Estrange being strangers in all but name, and Cyril Loraine little less strange, although he claimed to be recognised as the boyish companion of days long passed.

"Mamma and aunt Martha will be delighted to hear of your arrival, and so will Rosaline," said Sophia.

"Dear kind aunt Martha! I am glad to hear she is with you, though grieved that Rosaline is not strong enough to be allowed to venture on a walk. Is Mr. Hamilton staying within to amuse her?"

"Oh, no!—Poor James has not yet been able to leave his brother, who was taken ill at college from the exhaustion of too close study; but we do hope he will be here soon."

"His brother ill? That must be a trial. I trust he will be spared to him after all the self-denial he has undergone in order to give him a good education.—I trust he will be spared to him! Where is he, for Kirkfield at Christmas will not look like itself without him?"

"He has taken William from Oxford to his aunt in Shropshire, where he will be well nursed; and James still hopes to get to us for a short time, though he cannot be spared from his curacy much longer."

"I hope he will come very, very soon," said Agnes.

"Has he any prospect of a living, and does he still intend to have a Rose in his parsonage garden?"

"I think there is no immediate prospect of preferment," answered Sophia; "but I do think Rose is becoming more and more sedate, and better fitted for the station to which he has half-jestingly destined her from her childhood."

"But mamma says we are all getting too old to jest

on such a subject, and that such jokes are not only unbecoming in young women, but really injure the tone of their minds, and make them think lightly of what deserves most serious consideration; so we never call her James Hamilton's Christmas-Rose now, Margaret."

Though fully appreciating the propriety and good sense of Mrs. Loraine's sentiments, Miss Campbell could not help smiling at the demure air with which they were repeated by Agnes, and at the implied information that she too was to be considered a young woman, though she was still in all the engaging loveliness of early girlhood.

After chatting some time, the party arose to go away, having first asked and obtained a promise from Mr. Forster, that he and his Three Graces, as he called his daughters and their guest, would spend an evening at the Hall as soon as the moon was old enough to light them home again. On leaving the parsonage, some returned home, others proceeded to visit the cottagers; but all re-assembled at dinner, and the news of Margaret Campbell's arrival was gladly received by those who had not before heard of it, for she was a general favourite with old and young.

"I am pleased but not surprised at your report of Miss Campbell's cheerfulness," said Mrs. Martha Loraine, "for, though it is a common remark that persons with what are called high spirits are easily depressed, those who suffer such depression are usually those whose mirth is excited by outward circumstances, and requires 'all appliances and means to boot,' whilst a cheerful disposition is in itself a homefelt blessing; and when, like Margaret's, it has been encouraged by a religious education to look for its support at the hand of God, it is as superior to the former as the blessed sunshine is to the most brilliant illumination; as superior as the light of heaven is to the lights of earth."

"The first," added Rosaline, "may be compared to the varnish which can make this wood so bright, the last to the polish of yon marble slab—tears would stain the one, but roll off harmless from the other."

"You must not compare your friend to marble either, Rosaline; she may be as pure, but she is far from being as hard or as cold. Charlotte and Alice have told us how deeply she has suffered, and how tenderly she exerted herself amidst her sufferings; and I have often seen her mirthful smiles checked for a while by the sorrows of others, and then called forth again only to cheer and to assist them. I quite long to see her again."

"Aunt Martha, how is it that you are so very fond of lively young people? You always seem to enjoy their society; and I have observed too that you like books or poems of a lively description better than the sentimental works which we young ones select. You prefer *L'Allegro* to *Il Penseroso*."

"I can yet read both those lovely poems with delight, Sophia; but I confess the former now charms me most, and sets before me images of what I most dearly love; and pray recollect, Milton calls them 'unreproved pleasures.' Justine, amidst your foreign education, I trust you have been allowed a sufficient draught from 'the pure well of English undefiled,' to be acquainted with those poems?"

"Indeed, my dear aunt, I was very early made to learn them both by heart, because my father remembered they were favourites with you and with my poor mother; but I suppose I can scarcely enter into their beauties until I am a little further initiated into the mysteries of English rural life."

"Now," cried Charles, "'now comes the tug of war.' The girls will be striving to make you in love with *Il Penseroso*, and my aunt strenuously advocating *L'Allegro*. Which will you exclaim?"

"Hence, vain deluding joys,
The brood of Folly without father bred!"

or—

"Hence, loathed Melancholy!"

You have already seen the 'civil-suited morn, kerchiefed in a comely cloud;' I fear it will be some months before we shall introduce you to the 'dappled dawn,' pranked out with 'sweet briar, or the vine, or the twisted eglantine.'"

"But Justine will, I hope, one day feel how true is that lovely picture—"

'Where the great sun began his state,
Robed in flames and amber light,
The clouds in thousand liveries dight,
While the ploughman near at hand
Whistles o'er the furrow'd land,
And the milkmaid singeth blithe,
And the mower whets his scythe,
And every shepherd tells his tale
Under the hawthorn in the dale.
Straight mine eye hath caught new pleasures
Whilst the landscape round it measures,
Russet lawns, and fallows gray,
Where the nibbling flocks do stray;
Mountains, on whose barren breast
The labouring clouds do often rest;
Meadows trim, with daisies pied,
Shallow brooks and rivers wide,'

Surely we have all felt its truth many, many times."

"And I dare say Justine has already felt the reality of my favourite description," said Sophia, "which is to me the more striking, because only once or twice in my life have I had the opportunity of realizing it by visiting some of our magnificent cathedrals."

'But let my due feet never fail
To walk the studious cloister's pale,
And love the high embowed roof,
With antique pillars' massy proof,
And storied windows, richly dight,
Casting a dim religious light;
There let the pealing organ blow
To the full-voiced choir below,
In service high, and anthems clear,
As may with sweetness through mine ear
Dissolve me into ecstasies,
And bring all heaven before my eyes."

"And then," added Rosaline, "how soothing is that wish—"

'And may at last my weary age
Find out the peaceful hermitage.'"

"There, Rosaline, I believe you have found the key to our different tastes. In the beginning of life we have a mysterious pleasure in looking forward to the scenes which shall mark its close—" 'Tis distance lends enchantment to the view; and so we, who have travelled furthest on life's journey, love to look back upon the scenes of youth, and, as in a distant landscape the brightest points strike the eye the most prominently, so do we gaze on the joys of those early years, and love to have them recalled to our memory. I can remember, when I visited your dear mother, Justine, in Paris many years ago, I was delighted with Poussin's awful picture of the Deluge; now, I should perhaps dwell with more pleasure on the infant cherubs of Albano; formerly I was charmed with Sir Thomas Lawrence's wonderful portrait of the serene old age of Mrs. Locke, now I love to look upon the merry imp of Sir Joshua Reynolds, parading about in mamma's saque and muff. All nature is lovely, but our impression of this loveliness is much modified by the point from which we view it; so, my dear girls, whilst you prepare yourselves for old age by contemplating it in its most soothing aspects, let me cheer its actual presence by the reflected remembrance of earlier enjoyments—"Come, thou goddess fair and free, in heaven yeleft Euphrosyne!"

"Why, aunt, you used to call Margaret Campbell, Euphrosyne; and when I was a little girl I used to try to find a flower of the Eyebright for her whenever she walked out with us."

"Why Eyebright, Agnes?" asked Frederic. "I never saw such people; everything with you is apropos to

flowers. Eyebright is the flower Sophia was praising last night."

"Yes, cousin," replied Agnes, "and I can tell you that its botanical name *Euphrasia* is supposed to be a corruption of the Greek word *Euphrosyne*, which is the name of one of the Graces, who presided over cheerfulness, and so it was a proper offering to Miss Campbell."

"Looking at this drawing of the plant, I cannot guess why it should have either this name, or that of Eyebright, for it seems a very quiet looking, insignificant little flower. This pretty blue flower has a much better claim to the name, for it looks as merry and as blue as some eyes I know."

"Oh, that is *Veronica*," replied Sophia, "but the *Euphrasia* grounds its claim on hidden virtues, which our ancestors supposed to reside in it according to the then received doctrine of signatures."

"The doctrine of signatures! what is that? Now, Sophia, your learning is about to peep out; so explain your doctrine with all gravity, and let us find your hose as blue as the *Veronica*, or as Agnes's saucy eyes."

"My sponsors gave me a right to be very grave and very wise, when they bestowed upon me my Greek name of Sophia, or wisdom; so I shall not spare you my lecture, Mr. Frederic, for all your laughter."

"Pray do not, and in time you may make me a philosopher—a lover of wisdom—or a lover of Sophia."

"Well then, the doctrine of signatures taught that all natural productions in which could be traced a fancied resemblance to any part of the human frame, would yield the best remedy for the complaints to which those parts are liable. Now, if you look at the *Euphrasia* you will perceive upon its corolla a curious dark purple mark, which greatly resembles the pupil of the human eye; and hence this plant was supposed to possess great efficacy in removing any complaints of the eye, and in clearing any obstruction of vision. Milton alludes to this supposed virtue, where he represents the Archangel Michael as clearing Adam's sight by its application, when he was about to foreshow him the fate of his descendants. Ho

'then purged, with euphrasy and rue,
The visual nerve, for he had much to see.'

"You say the supposed virtue; is it not really of use to the sight?"

"Medical botanists of the present day declare it to be not only useless but injurious to the eyesight; yet the old faith still lingers in our sequestered dales, and the cottars still believe in its efficacy, and use an infusion of the plant in milk, which they apply with a feather to the eye."

"What a curious fancy! Pray, are there many plants thought to possess virtues for a similar reason?"

"Many, I believe; but my acquaintance with them is only limited. There is the *Pulmonaria*, or Lungwort, which, from some resemblance in the scaly leaf to the tubercles of diseased lungs, is held to be useful in cases of consumption. The *Hepatica* is a plant deriving its name from the resemblance of its three-cleft leaves to the three lobes of the liver, but I never heard of its popularity as a cure for hepatic diseases; indeed, it is not indigenous, so not likely to be much known to the rustic herbwoman."

"There is the *Saxifrage*," said Lucy.

"Oh, yes. The roots of some of the *saxifrages* resemble small stones or gravel, hence it derives its name *saxifrage*, signifying breaker of stones, and is supposed to be very efficacious in those painful disorders, the stone and gravel. The *Saxifraga granulata* is extremely lovely, showing its snowy flowers occasionally in moist meadows; but, in this neighbourhood at least, it is a rare plant. In it the resemblance of the roots to small stones or grains is very decidedly marked. The *Saxifraga Heltaria*, or Harry Saxifrage, is also very pretty, and so is that species which is known by the name of London Pride."

"Why London Pride?" asked Frederic.

"Because, though its native habitation is far from the haunts of men, in the clefts of the rock and under the shades of the wood, it will thrive remarkably well in the smoke of a town, where the inhabitants may take a pride in its ornamental appearance."

"I do not remember ever to have seen the plant in London," remarked Justine.

"Probably not, my love," said Mrs. Barlow, "for fashion has pushed the simple flower aside, whilst the progress of luxury and the great improvements in gardening now supply the wealthy inhabitants of the metropolis with a succession of lovely plants forced in the conservatories of Hammersmith or Chelsea, to which they are returned when they cease to bloom, and from whence their place is supplied by others. To my memory the name of this pretty little plant brings back my days of early childhood, when I was some time domesticated with my grandfather, a merchant in the city, in whose narrow slip of yard, which my good grandmother loved to call a garden, it flourished in luxuriance, unchecked by the thick gloomy atmosphere around. Even now I can picture to myself the heavy black loam, half covered with damp green moss, in which it was planted, and fancy again the smell of the earth, which was given forth when I was allowed to play at gardening, my sole implement being one of the oyster-shells which were placed as an ornamental edging to the border. How I used to watch the delicate flowers unfolding! and how delighted I was with permission to gather the first spike, and see it placed in a glass of water with a group of hen-and-chicken daisies! These were my favourite flowers, and had no rivals in a few sprigs of bergamot which shared the border with them, or in the dull grey flowers and straggling branches of a tea-tree which was trained against the wall, and which my grandfather particularly delighted in, because he had mercantile dealings with China. It was one of my treats when a good child to be seated at the table beside him, raised up in a great arm-chair by the help of two or three huge old folio ledgers, and to watch him turning over a collection of Chinese paintings on rice paper, which showed the whole process of the manufacture of the tea we use, from the gathering of the leaves to the shipping of the well-packed chests. Then, when I compared the plant with the drawing, I fancied it very strange and rare; but still preferred my London Pride, or None-so-pretty, as my grandmother called it, to the pale dusky blossoms of the poor foreigner."

"I do not remember to have heard the name of None-so-pretty before," said Lucy, "but the plant is really deserving of the simple term of endearment."

"I had no playfellows," continued Mrs. Barlow, "and the manners of the day did not allow me to talk much to my elders, so I had plenty of time for childish reveries, one of which used to be on this very name. I could not clearly make up my mind why the plant was called London Pride, because it looked so very humble and unpretending; and I remembered the much handsomer roses of Hampshire, and had heard my father call the rose the queen of flowers. After much consideration I thought it must have grown proud because people sometimes called it None-so-pretty; for grandmamma used to say very mysteriously to the visitors who praised my bright eyes and rosy cheeks, 'We must not make little girls proud and vain; Ellen is a good girl, and goodness is better than beauty'; and then contrive to send me out of the way of my injudicious admirers. Having thus settled the derivation of the name in childhood, I do not remember to have recalled the subject, or to have heard the real derivation until this evening."

HEIDELBERG AND THE BLACK FOREST.¹

ONE of the most agreeable evenings which I remember to have ever spent, was this evening of the first day which we passed in Heidelberg. The host of the coffee-house was a fine jolly fellow, who accosted us in very tolerable English, saying that he saw we were strangers, as he had observed us looking at the "casquettes and the hairs of the students," pronouncing the word hairs with an almost imperceptible aspirate, so that at first we scarcely knew whether it was intended for hair, or airs; as the word, however, was equally applicable in either signification, we committed no *contre-temps* in our reply, and were soon engaged in a spirited conversation. Our host had been in England, and, though his principal observation on its customs was, that he did not like the taste of porter, and thought the London ale too strong, he had a great deal more to say of his own country. He expatiated with great delight on Heidelberg, its students, its castle, and his own coffee-house, and, above all, his band; concluding by calling in the musicians to strike up the "Valhalla Lied," which he said was the "God save the King" of Germany. It was responded to with great enthusiasm, all the company joining, and clattering their glasses in time, with tremendous fervour. This "Valhalla Lied," though a very fine musical composition, is not exactly the German "God save the King," as our worthy host styled it, not being as yet a national song of any standing or very great popularity. It is, in fact, a hymn intended for the inauguration of the King of Bavaria's Valhalla for the reception of statues and memorials of all the German heroes, and is one of the many poetical effusions which have appeared of late, appealing to the general brotherhood of Germany, but none of which have attained any really universal position as national songs.

The sage Knickerbocker, in his erudite History of New York, gives divers incontrovertible reasons why an alderman should be fat, but I do not, for my own part, see any reason why the landlord of an inn or tavern should be so; nor what can be the object of Nature in gifting these personages with a comfortable obesity, unless, indeed, it be to disprove the arguments of the Tee-totalers, by a display of the admirable condition vouchsafed even to the very high-priests of the forbidden worship. At any rate, whatever be the reason, the fact is pretty generally admitted; in England, perhaps, the rule is not quite universal, but in Germany my own observation would lead me to believe that it holds in almost every case. Our landlord of the little inn at the post-station was an admirable specimen,—with a moist eye, a red cheek, and a voice that seemed as if it had got a twist by the continual rolling of liquor down his throat; he always looked as if bursting with fat and jollity, and he had a jest and a laugh for every one that approached him. He was a great Liberal withal, and would lecture you for hours on the necessity of enlightened principles in politics, and the advantages which would accrue to the world in general, if Prince Metternich were hanged, or shot, or drowned, or all three; the King of Prussia, too, met with his special disapprobation, for the way in which he had treated one of the Deputies to the Representative Chamber of Baden, who, being of liberal opinions, had paid a visit to Berlin. Baden, it must be remembered, is a free country, and enjoys a constitutional representative government. By-the-bye, now that I am talking of our landlord, I may give a piece of advice to all travellers who, on arriving at any moderate sized town, such as Heidelberg, are at a loss what inn to select. If they are only to remain for a night or two, they will generally find it a good plan to put up for that short time at an inn belonging to the post-station: these inns are small and unpretending, but I have usually found them comfortable, well served, and economical; and you will be far more likely

to be well attended to than in the more pretending house to which you may go on chance.

Except its castle, which will afford days of unwearying enjoyment, and the beautiful scenery around, Heidelberg does not possess many objects of attraction. The college, though large, is a very common-place building; the library, attached to it, was once renowned throughout Europe; but though that portion of it which was sent to Rome by Tilly has been restored, it has never regained the fame which it enjoyed before the time when that ruthless old ravager used its finest and most valued treasures as litter for his cavalry. The university has degenerated also in another point of quite as much moment to itself; namely, in the number of its students, which has greatly diminished since the despotic governments of Germany have become alarmed by the spread of liberalism at this college, and have prohibited their subjects from attending, lest their pure minds should be infected by the poison, and the little innocents should suck in Liberalism with their Latin. The streets of the town are narrow and dingy; and the number of students, and of those establishments which minister to their wants, show what is the principal support of the inhabitants. There are numerous booksellers' shops, with the windows full of students' song-books and translations from the Classics; and still more numerous pipe-manufactories, the windows of which display china bowls of every shape and size, adorned with paintings suited to every turn of mind,—soft-looking young ladies, with blue eyes and flaxen hair, for the sentimentally-amorous; fierce heroes, in moustache and beard, for the warlike; and heads of Ronge and his brethren, for the votaries of the religious movement.

The scenery of the Neckar from Heidelberg upwards is of surpassing beauty. During part of the year a steamer runs up the river as far as Wurzburg, but the deck of a steamboat is the worst possible point from which to appreciate river scenery, and that for one principal reason amongst many others, that you lose the advantage of the view of the water; the true plan is to walk or ride up the banks, as close to the water as possible. By this means you combine all the beauties, both those at hand and those in the distance. It was on a delightful afternoon that we passed up the Neckar valley; showers of rain fell every now and then, clearing and softening the air, and rendering the sunshine more brilliant, and the green of the trees more verdant. The river ran rapidly and musically at our feet, clear and joyous; the hedges by the road-side were covered with rain-begemmed flowers; and the huge round-backed hills clad with fir-trees of every hue, now closed in around us, as if to bar the way, and now opened up again, disclosing a long stretch of valley in front, and affording glimpses of sunny cornfields and luxuriant meadows smiling in the distance. We were, however, bound for Wurzburg; and as the road, to avoid the windings of the stream, leaves its course, we too crossed the water by means of a flying bridge, plunged deep into the woods, and here we were at length travelling through the Black Forest. The Black Forest! what a train of associations that name calls up. What visions, dwelt upon in early days with terror-stricken delight, of blood-thirsty banditti, housing in impenetrable caves or ruined castles; horrible magicians, who required the blood of innocent victims to consummate their hellish sacrifices; inns, in which the unlucky wayfarer was always murdered immediately after supper; and dilapidated monasteries, in which several of the passages, and invariably the chapel, were haunted. The forest itself ascribed to the mind's eye, thick, gloomy, and impenetrable; enormous fir-trees and gnarled oaks flung a wizard gloom around; and the tangled brushwood was impervious to all, save the robbers and spectres who inhabited these dreary wilds. Such were the recollections which arose within me as we entered the Odenwald, as this part of the Black Forest is called; and, as if to keep up the character of the scene, the weather, before so cheerful,

(1) Concluded from page 117.

became dark and lowering, and finally set in for an afternoon of rain. But it was in vain that I attempted to attune my mind to the scene, by recalling all the terrific tales which had in former times invested these localities with such horror, from the laboured productions of the Monk Lewis and Radcliffe school, down to those less pretending romances which, recited in bed to a juvenile audience, had caused so many a bosom to thrill with fear; romances, the incidents and characters of which always bore a touching similarity to each other, there being invariably a heroine of unspeakable beauty and guileless simplicity of heart, who is beloved by two heroes—the one, according to circumstances, a wizard who has sold himself to the powers of darkness, or a ruthless bandit in disguise—the other, a more favoured, but unhappy youth, who is eventually discovered to be at least a powerful baron; a cruel uncle, a conscientious domestic, or pious father-confessor, and an ancient nurse—with such *dramatis personæ* the incidents of the tale may be as easily imagined as described. It was in vain, I say, that I recalled these youthful visions; not that I was so daring as to hope for anything like an adventure such as I had once supposed occurred every day, or at least every night, in this charmed region; but I had hoped that something of the character, whether real or supposed, of former times, might still be left, and that, whilst passing through this district, and gazing on the scene around, one might still fancy that such things were possible. But, alas! the march of improvement has reached even here; and it must be apparent, even to the wildest imagination, that no more danger is now to be dreaded in the Black Forest than on Blackheath. Fine roads now run where formerly were mere bridle-paths, obscured by the dark shade of the gloomy firs; coaches travel up and down, full of merry passengers, where once benighted wayfarers were wont to hurry, one and two together, terrified and trembling; and, instead of meeting ghastly spectres and villainous hand-ditti, a harmless peasant is in general the only individual to be seen. The forest, indeed, yet remains, though woefully shorn of its grandeur. You pass through many a mile of arching fir-trees hanging on the sides, and crowning the summits of the swelling hills; the wild flowers and the thick underwood spring luxuriantly from the black, leafy soil, telling of years of undisturbed dominion; and it is only here and there that the forest opens, and displays cornfields and green pastures, dotted with farm houses and peasants' cottages. Occasionally, too, you pass a forest-ranger with his horn and his rifle, and catch a glimpse of his little rustic lodge, half hidden in the wood, or, perhaps, a woodcutter, and his picturesque establishment—I do not mean one of the grand modern woodcutting stations belonging to government, of which there are many, but the regular authentic woodcutter of the fairy tales. By the bye, it has always struck me, that one gets quite a new light as to the real character of these important personages in fairy literature, by travelling on the Continent. In England their occupation is gone; and one who has never been out of this country can scarcely form an idea of what a woodcutter is; but a few days travelling in France or Germany presents the honest peasant as he was of old with us, making up his faggots, and carrying them home, and quite as well suited as ever to shelter houseless heroines, and rear up foundling princes.

The Black Forest, then, disarmed as it is of its grisly terrors, is even now not without its attractions; to say nothing of the Hartz mountains, much of its scenery is extremely beautiful; there yet remain many ruined castles, and traditionally haunted valleys. The people are in general a simple, kindly race, not much tainted by intercourse with strangers; and a fortnight might at any time be very pleasantly passed in exploring the most interesting scenery of the old forest. Any one who might attempt such an excursion will find it, I am sure, a good plan to buy a pony, and make his tour on horseback. The ground is not very well adapted for

pedestrianism, and the habit of riding whilst on a journey, once universal in England, is still common in Germany, so that no surprise will be excited by the adoption of such a mode of conveyance. The expense, too, will be a mere trifle, as a sufficiently good horse may be bought for a few pounds, and sold again at the end of the journey, at any rate, for not much less than its original price.

Jogging quietly along over tolerably good roads, we, about eight in the evening, reached the station where the mail (for it was by it that we travelled) was to stop all night. Imagine, gentle reader, her Britannic Majesty's mail resting for the night. It was a small town, called, if I mistake not, Mittenberg. A genuine German country town, consisting of a square of small dirty houses with a church and a post station. We drove up to the only inn in the place, and, passing under a low browed archway, entered a door to the left hand, which opened into the common stove or sitting-room. It was a large low apartment, the ceiling of which was formed by the beams and flooring of the chambers above; the room was divided down the middle by three or four pillars of rough fir; one end of the division nearest the door was partitioned off by rough boards into a small den or bar, the sanctum of the host; whilst a long table of deal planks ran down the whole length of the other division. Some twenty or thirty persons were seated at the table, eating, drinking, and smoking. It was the most perfect specimen of an old-fashioned German inn we had seen; the atmosphere was thick with smoke, the candles burned dimly, and so great was the obscurity caused by the fragrant vapour, that, when we took our seats at the upper end of the table, it really was almost impossible to discern the countenances of those furthest from us. The whole scene was something like what the interior of a Black Forest hostelry should be, and we made a capital supper of stewed venison and very fair beer, quite delighted with all around us. The accommodations of our sleeping apartment were quite as primitive as those of the sitting-room, consisting of two beds about five feet by two, without any blankets or other coverlet than a huge feather-stuffed cushion, and pillow cases not of linen, but Chamois leather—two wooden chairs, and a small table on which stood a couple of white pie-dishes of coarse earthenware and very small size—beside which were two long-necked green wine bottles.

"These pie-dishes," said I, "are instead of basins for our ablutions; but they do not seem to have given us any water—at least I can't see the ewers."

"Nor I," said Glance, "and it is very disagreeable that these bottles should have been left here. I suppose some of the inmates have been drinking in this room, and have forgotten to clear away the things."

"Perhaps," said I, "they may keep up the good old fashion of a sleeping cup here, and the bottles are intended to be discussed by ourselves. Are they empty? No, they are full."

"What is it," cried Glance, with a look of eager expectation, as I began pouring out the contents. It was water.

We stared at each other for a minute in blank amazement, and then burst into a fit of uncontrollable laughter at the disappointment.

"Why," said I, "the bottles are the water jugs, and a very fit accompaniment they are too in that character to the basins."

"Well," returned Glance, shaking his head gravely, "that I should ever live to wash my face in a pie-dish, and fill it from a wine bottle instead of a water ewer! This is keeping things in apple-pie order with a vengeance."

There was no time for further discussion as we were to be up at three the next morning, and we accordingly turned in as rapidly as possible.

Can there be a greater misery than that of going to bed, tired and sleepy, with the knowledge that you are

to be roused at some such unearthly hour as this? It is in vain that you turn from side to side, and try to banish the fearful thought by sleep. It will not leave you—your slumbers are oppressed by it—the coming misery weighs upon you like a nightmare, and the only advantage of the experience is that you can realize perfectly the feelings of a man during the night before his execution. Then the dread reality of the waking—the getting out of bed in a cold shiver—the dressing by a dismal candle—and the hopelessness of collecting the various items of your property. Such wretchedness as this is almost enough to make one forswear travelling. We were treated however as well as the circumstances would admit, and got a capital cup of coffee from an uncommonly pretty servant maid, whose appearance did great credit to her forest breeding.

Whilst waiting in the cold drizzly air of a raw morning, we were joined by a gentleman with whom we had made acquaintance the preceding evening, and who now announced himself as a fellow traveller. He was a general in the Bavarian service, a very old man, with a white beard and huge moustache, and wrapped up in a black Caucasian felt. He was a complete character, and had travelled over all Europe and Asia as far as Persia—a perfect gentleman, but opinionative and eccentric as an Englishman. Indeed, he had resided long in England, and knew the whole of the British isles, from the Land's End to the Orkneys. His admiration for the British was unbounded. They were, he said, the greatest people of the world, whilst he invariably spoke of his own countrymen with the greatest contempt. They had not spirit, had not sense for anything. What was the use of the painting and singing, and so forth, with which they were always taken up? a picture could not talk or move, or do any good; and their confounded music which they were always dinning into one's ears, was nothing but *Be-aw*; in short, Germany was a country ruined by music. These were rather curious sentiments for a German and a Bavarian, and not perhaps altogether correct; but I could not help thinking, that there was a great deal of sense in them, so far as Germany is concerned. On the other hand, much as our friend liked the English, so much the more did he detest the French; they were, he said, all robbers and plunderers; and his opinion of Napoleon was summed up in one pithy though not very charitable sentence—"I wish he were alive, and I could hang him." We had another fellow traveller, a gentleman with a pleasing scent of garlic, who got out about half way, and performed his toilet in the yard of the inn at which we were changing horses, he being in fact the landlord. The process was a curious one, and the sight of it made us thankful that we had been esteemed worthy even of our despised pie-dishes. The operator having procured a small tumbler about half full of water, took a large mouthful and rinsed his mouth, then ejecting the water into his hands, he rubbed them rapidly over his face—this operation was repeated, his hands were dried in his hair, and the toilet was at an end. The Bavarian general seeing our astonishment, took a long whiff of his pipe and said—"Ah, you see we are not so nice here as in England." And so we trundled on, and about eleven o'clock reached the gates of the ancient city of Wurzburg in Bavaria.

LE VERRIER'S PLANET.

[THE following account of what may be considered, perhaps, the most remarkable scientific discovery of the age, is taken, with some slight alterations, from the *Guardian* newspaper. It is written with so much clearness as to make the steps by which the discovery was reached sufficiently intelligible, we should think, even to unscientific readers.]

THIS year has witnessed one of the most remarkable triumphs of modern science. The discovery of a new planet, and that one of the largest of our system, is in itself

a memorable event; but the discovery assumes a new interest when it proves to be, as in this case, not the result of accident, or of a lucky guess, or even of mechanical skill and increased power in our glasses, but of abstract mathematical reasoning, employed on the result of patient and exact observation. The existence of the planet was established as a matter of necessity—the laws of its orbit, and its very place in the heavens pointed out, not vaguely and on conjecture, but on rigorous mathematical grounds, and in degrees and minutes, three weeks before the planet was descried: the mathematical analyst made his calculations on paper, and told the observer where to look, and, true to the prediction, the planet appeared.

The last and farthest of the planets, till lately, was supposed to be Uranus. But outside that which seemed to be the extreme verge of our system, it now appears that a mighty stranger, far exceeding Uranus in size, has been rolling in orbits of 217 years, unknown in its outer darkness, a Titan more vast and powerful than the oldest of the gods, and whose blind but strong influence on the motions of Uranus, have at last betrayed his presence.

The credit of this brilliant discovery belongs to a French astronomer, M. Le Verrier, and we earnestly hope that no attempt will be made to diminish his well-won honour.

The history of the discovery is shortly this:—The irregularities of the orbit of Uranus having been for some time past a difficulty to astronomers, M. Le Verrier was led to a more close examination of that planet's motions; he found that of the whole amount of irregularity in its path, or of its perturbations, only a comparatively small part could be accounted for by the attraction of any known forces. And hence he was led not merely to guess at the existence of some other unknown body or force, but to grope his way by help of previous observations, and the wonderful powers of modern mathematical analysis, to a distinct conclusion as to the very place where a new planet, outside of Uranus, might be looked for in the heavens. Accordingly, it has been found within one degree of the place he assigned it, and very nearly at the calculated distance from the sun.¹

His calculations were first laid before the French Académie des Sciences, June 1, 1846, and an abstract of his paper is given in *Les Comptes Rendus des Séances de l'Académie*, No. 22, p. 907, seq., of which we subjoin an outline:—

In 1820, M. Bouvard attempted to construct exact Tables of the orbit of Uranus. His data were:—1. A few old observations by Flamsteed, Mayer, and others, before it was known to be a planet. 2. The meridian observations of 40 years (1781 to 1820), since Herschel's discovery. And 3. The analysis in the *Mécanique Céleste* of the influence upon Uranus of the attraction of Jupiter and Saturn. But he found it impossible to make the latter observation agree with the older ones of Flamsteed, &c., or to make use of both sets, in representing the path of the planet, and he cut the knot, by throwing over the old observations, and charging them with gross, and, as M. Le Verrier says, inconceivable errors.

M. Bouvard's tables represented with tolerable exactness the observed places of the planet during the 40 years from 1781 to 1820. But it was found that 25 years after their construction (1845), they agreed with the latest observations as little as they did with the earliest ones.

These remarkable discrepancies excited M. Le Verrier's attention; they might be the result of want of precision in theory, or want of exactness in observations; or Uranus might be subject to other attractions than those of the Sun, and of Jupiter and Saturn, and in this case there came in the question, as to the possibility of determining the cause of these perturbations, and fixing the place of the stranger, the source of so much difficulty, where it might be looked for by observers.

On examining M. Bouvard's Tables, M. Le Verrier found so much inexactness in the data and calculations on which they were founded, that, in order to start on a secure basis, it was necessary to investigate and calculate everything afresh with the utmost rigour. This task he undertook.² He reduced for himself the older, and the more modern observations,³ taking in also the unpublished ones of M. Arago made between 1835—1845; and he investigated with very great nicety the amount of perturbation in the orbit of Uranus, due to the attraction of Jupiter and Saturn. With these corrected data before him, he proceeded to compare the calculated path of the planet with its

(1) Encke's Letter to Schumacher, Sept. 26.

(2) Nov. 1844.

(3) More than 300.

actually observed positions; and he came to the conclusion, not merely that there was difficulty and discrepancy in the comparison, but that, on grounds of the strictest geometrical reasoning, none of those known forces were adequate, to produce the observed irregularities of the planet's course. On this point, viz. the proved incompatibility of the observed positions of the planet, with the supposition of its being under the influence only of known forces, he insists strongly as a new and distinct step gained.

Several ways had already been suggested of getting rid of the difficulty—the resistance of the æther—a vast satellite of Uranus—some variations in the laws of gravity at that enormous distance from the Sun—the shock of a comet—or, lastly, an unknown planet. But these were mere vague and unsupported suppositions, which any one might hazard in the uncertainty which surrounded the subject. The theory of Uranus had never been treated rigorously, and the irregularities in its orbit were themselves problematical; they were now undoubted, and it was time for mathematics to take the place of guess-work.

He then shows that all these suppositions, except the last, are inadmissible; and that, if the disturbing force proceed from an unknown planet, the stranger must be,—not within the orbit of Uranus, because, if a large body it would disturb Saturn's orbit, if a small one it would not be adequate to produce the actual amount of disturbance in that of Uranus: nor, for the same reasons, near on the outside of the orbit of Uranus;—but, far enough without the orbit of Uranus to act upon it, without acting upon that of Saturn, and large enough to act upon Uranus for long and continuous periods of time. According to the law of planetary distances—that the planets double on one another in their distances from the Sun, as they are more remote in the system—this new planet ought to be twice as far from the Sun as Uranus: and thus probability becomes almost a certainty; for, as its distance cannot be much less, so it cannot be greater, *e. g.*, treble the distance of Uranus; because, as in that case it must be of enormous mass, it must act upon Saturn as well as Uranus, and its great distance from both planets would make its influence on each comparable; whereas there is no trace of any such influence on the orbit of Saturn. Further, such a body acting on the orbit of Uranus, must be, without doubt, in much the same plane as Uranus; *i. e.*, must be looked for nearly in the *Ecliptic*.

He then states this as the question which he undertakes to solve:—"Is it possible that the inequalities of Uranus are due to the influence of a planet, situated in the *Ecliptic*, at a mean distance double that of Uranus? and if so, what is the actual place of the planet? What is its mass? What are the elements of the orbit which it describes? The problems thus enounced, I proceed to resolve rigorously."

Assuming, then, that the supposed planet is to be looked for nearly in the *Ecliptic*, he proceeds to attempt to ascertain its longitude. And this he professes to do. He offers strict geometrical proof, for which we must refer to his paper itself, that there cannot be two regions of the sky where it is to be looked for; and fixes its place within the limits of ten degrees. And he proposes to go on further, and using the ground which he has thus made good, to narrow still more the limits of the longitude, and to "correct the duration of its periodic revolution."

He thus sums up the substance of his paper of June 1:—"It may be seen, that to obtain all the aid that I required, by combining theory with actual observations, I have had successively—

"1st. To go over afresh the calculation of the perturbations which Jupiter causes on Uranus—to determine those which are produced by Saturn, by pushing the approximations to the squares and products of the masses—a procedure which has introduced remarkable changes in received theories.

"2d. To reduce nearly 800 meridian observations of Uranus.

"3d. To calculate the corresponding heliocentric positions of this planet, on the supposition that it only obeys the united influence of the Sun, of Jupiter, and of Saturn; to deduce thence the geocentric co-ordinates, by the help of Tables of the Sun, and thus to prove decisively that there is an irreconcilable difference (incompatibility) between the places thus calculated, and the places observed.

"The distance of a hitherto unknown planet being thus placed beyond doubt, I have reversed the problem, which has been hitherto proposed in calculating perturbations.

Instead of having to measure the action of a determinate planet, I have had to begin from irregularities recognised in Uranus, to deduce from thence the elements of the orbit of the disturbing planet, to give the position of this planet in the heavens, and to show that its influence perfectly accounted for the apparent irregularities of Uranus."

In a second paper (*Comptes Rendus*, August 31, 1846), he proceeded to fix yet more exactly the place, size, and distance of the yet unseen planet.

Such was M. Le Verrier's idea of a planet hitherto undiscovered from the Earth, a body many times the size of the Earth, and not much less than Saturn, and taking more than two centuries to revolve about the Sun, at a distance 33 times greater than the Earth; *i. e.* 33 times 85,000,000 miles. That is to say, a person travelling from the Earth at the rate of 30 miles an hour, would reach it at the end of something over 11,500 years.

Within one month after M. Le Verrier had thus minutely fixed beforehand the place of this mysterious body, it was actually seen. On the 23d of September, Dr. Galle, of the observatory at Berlin, received a letter from M. Le Verrier, urging him to look out sharply for the new star, which possibly might be recognised by its disk. That very evening Dr. Galle, on comparing Bremiker's excellent map with the heavens, observed near the place fixed by Le Verrier a star not marked by Bremiker. It was compared three times that night with a known fixed star, and a planetary motion was suspected; the following night it was again observed, and its motion was confirmed, and agreed quite with Le Verrier's announcement; and on the third night, September 25, Galle observed it five times, and Encke ten, and the place of the planet had again changed. Its positions are given by Encke, which show that the place agrees within one degree, and the retrograde motion shows also that the distance is very nearly correct. With such marvellous verifications, it is not more wonderful to learn further, that Le Verrier's announcement of its size nearly agrees with Encke's measurements.

The planet has since been observed repeatedly, both in England and abroad. "It is," as the German observers say, "the noblest triumph that theory ever achieved." Our obligations are due to M. Le Verrier, it has been seen, not for merely an ingenious conception of a possible disturbing cause, but for having demonstrated its nature and position before it had been detected by human eye. In this respect we believe his discovery is unprecedented. Disturbances which affected the return of Halley's comet in 1759 led Clairaut to suppose that there was a planet beyond those at that time known, and Uranus was eventually discovered. Bode's laws of the relative distances of the planets from the Sun induced a search for a planet between Mars and Jupiter, which led to the discovery of those wonderful little bodies, Juno, Vesta, Pallas, Ceres, and lastly Astræa. In all these cases the observer probably deserved more credit than the mathematician; but it was reserved for M. Le Verrier to venture to make an unknown planet the subject of a rigorous mathematical problem, and on mathematical grounds alone, and with mathematical exactness, to anticipate and guide the observer. Calculations of the same nature may have been engaging the simultaneous attention of other mathematicians, but M. Le Verrier's claim to the honour of this achievement must always be paramount, because he first had such confidence in his theory as to announce it publicly, without qualification, and in the minutest expression, and to stake his credit on its verification.

As an amusing pendant to the above, we subjoin the following ingenious squib upon the subject, taken from the *Athenæum*.

ASTRONOMICAL POLICE REPORT.

AN ill-looking kind of body, who declined to give any name, was brought before the Academy of Sciences, charged with having assaulted a gentleman of the name of Uranus in the public highway. The prosecutor was a youngish looking person, wrapped up in two or three great coats; and looked chillier than anything imaginable, except the prisoner,—whose teeth actually shook all the time.

Policeman Le Verrier stated that he saw the prosecutor walking along the pavement,—and sometimes turning

sideways and sometimes running up to the railings and jerking about in a strange way. Calculated that somebody must be pulling his coat, or otherwise assaulting him. It was so dark he could not see; but thought, if he watched the direction in which the next odd move was made, he might find out something. When the time came, he set Brünnow, a constable in another division of the same force, to watch where he told him; and Brünnow caught the prisoner lurking about in the very spot,—trying to look as if he was minding his own business. Had suspected for a long time that somebody was lurking about in the neighbourhood. Brünnow was then called, and deposed to his catching the prisoner as described.

M. Arago.—Was the prosecutor sober?

Le Verrier.—Lord, yes, your worship; no man who had a drop in him ever looked so cold as he did.

M. Arago.—Did you see the assault?

Le Verrier.—I can't say I did; but I told Brünnow exactly how he'd be crouched down,—just as he was.

M. Arago (to Brünnow).—Did you see the assault?

Brünnow.—No, your worship; but I caught the prisoner.

M. Arago.—How do you know there was any assault at all?

Le Verrier.—I reckoned it couldn't be otherwise, when I saw the prosecutor making those odd turns on the pavement.

M. Arago.—You reckon and you calculate! Why, you'll tell me, next, that you policemen may sit at home and find out all that's going on in the streets by arithmetic. Did you ever bring a case of this kind before me till now?

Le Verrier.—Why, you see, your worship, the police are growing cleverer and cleverer every day. We can't help it:—it grows upon us.

M. Arago.—You're getting too clever for me. What does the prosecutor know about the matter?

The prosecutor said, all he knew was that he was pulled behind by somebody several times. On being further examined, he said that he had seen the prisoner often, but did not know his name, nor how he got his living; but had understood he was called Neptune. He himself had paid rates and taxes a good many years now. Had a family of six,—two of whom got their own living.

The prisoner, being called on for his defence, said that it was a quarrel. He had pushed the prosecutor, and the prosecutor had pushed him. They had known each other a long time, and were always quarrelling; he did not know why. It was their nature he supposed. He further said, that the prosecutor had given a false account of himself; that he went about under different names. Sometimes he was called Uranus, sometimes Herschel, and sometimes Georgium Sidus, and he had no character for regularity in the neighbourhood. Indeed, he was sometimes not to be seen for a long time at once.

The prosecutor, on being asked, admitted, after a little hesitation, that he had pushed and pulled the prisoner too. In the altercation which followed, it was found very difficult to make out which began; and the worthy magistrate seemed to think they must have begun together.

M. Arago.—Prisoner, have you any family?

The prisoner declined answering that question at present. He said he thought the police might as well reckon it out whether he had or not.

M. Arago said he didn't much differ from that opinion. He then addressed both prosecutor and prisoner; and told them that if they couldn't settle their differences without quarrelling in the streets, he should certainly commit them both next time. In the mean time, he called upon both to enter into their own recognizances; and directed the police to have an eye upon both, observing that the prisoner would be likely to want it a long time, and the prosecutor would be not a hair the worse for it."

POPULAR YEAR BOOK.

December 26.—*Feast of St. Stephen.*

"It is owing," writes Brady, "to St. Stephen having been the first who suffered for his steady adherence to the Faith of CHRIST, that his anniversary has been fixed immediately following the day held by the Church in commemoration of the Nativity of our Saviour." The

author of the *Popish Kingdom* makes the following allusion to this festival:—

"Then followeth St. Stephen's day, whereon doth every man His horses jaunt and course abroad, as swiftly as he can, Until they do extremely sweat, and then they let them blood; For this being done upon this day they say doth do them good, And keeps them from all maladies and sickness through the year,
As if that Stephen any time took charge of horses here."

Mr. Douce is of opinion that the custom of bleeding horses on this day is extremely ancient, and that it was brought into this country by the Danes. The Finns, upon this feast, throw a piece of money, or a bit of silver, into the trough out of which the horses drink, under the idea that it "prosperes those who do it." Within the memory of an aged and respectable native of Middleton, in Cork, living in 1827, it was a custom upon this anniversary for the young men of the vicinity, in their holiday attire, decorated with gay and variously-coloured ribands in their sleeves and hats, and one of them carrying a furze-bush, in which a wren was secured, to parade the town and contiguous villages. Stopping opposite the mansions of the gentry, one of the party repeated these lines:—

"The wren, the wren, the king of all birds,
Was caught St. Stephen's day in the furze;
Although he's little his family's great;
Then pray, kind gentlefolks, give him a treat."

Instantly, in the true spirit of Irish hospitality, open flew the gates, and the little "king of all birds" entering with his attendants, found the "trate" prepared for him. This usage, it appears, was grounded on the tradition that follows:—During one of those periods when Ireland "writhed in the agonies of rebellion," a party of royalists, having been harassed by their enemy and exposed to imminent danger, inasmuch that they were worn out with hardships and incessant watchfulness, bivouacked in a secluded valley, which they considered a place of safety. They lay stretched upon the turfs in deep sleep, and even the sentinel yielded to its influence. While they lay thus, the enemy, aware of their exhausted state, and suspecting the place of their retreat, were silently bearing down upon them. The rebels were within musket-shot of their intended victims, when a wren tapped with its bill three times upon the drum. The sound startled the sentinel; he sprang up, and saw the retiring bird and the advancing multitude, and alarmed his sleeping comrades to arms. Rendered desperate by the peril of their situation and the suddenness of their surprise, they encountered their confused and disappointed foes, and conquered. The custom above described has been long discontinued, but one very like it still exists at Rathlee, in the sister island. On Christmas Day, and on the Sunday previous to it, numbers of men and boys turn out with sticks, and, hunting all the fences of the fields, and the over-hanging river banks, drive out and kill the wrens amidst great shouting. On the next morning the immolators of these pretty winter birds parade, in parties, about the streets. In each group is one man with a large holly-bush (decorated with ribands), to which hang, perhaps, six or eight dead wrens; and his companions beg at the houses, and petition all persons whom they meet, for "money for the wren," in a curious species of chorus. The origin of this usage is involved in obscurity. A writer in 1811 relates that "on the feast of St. Stephen large goose pies are made, all of which they distribute among their needy neighbours, except one, which is carefully laid up, and not tasted till the Purification of the Virgin, called Candle-mas."

St. Stephen's is popularly known as BOXING-DAY, because on this festival tradesmen are visited by persons in the employment of their customers for a "Christmas-box," and every man and boy who thinks he is qualified to ask, solicits from those on whom he calculates as

likely to bestow. The Christmas-box was originally a box containing the money gathered against this season, that prayers and masses might be offered by the clergy to obtain forgiveness for the debaucheries committed by the people. Servants had the liberty to collect box-money, that they, too, might be enabled to pay the priest for his masses. Hence our modern "Christmas-boxes." The practice of making presents at Christmas appears to have been founded on the pagan custom of sending New Year's Gifts, with which it is now blended.

December 27.—Feast of St. John the Evangelist.

The festival of this saint is said to be celebrated the second from that of the Nativity, on account of the pre-eminent love of our Saviour towards him. We are told by Naogeorgus that it was formerly customary for the clergy to give hallowed wine on this day to their parishioners. He adds:—

"And after with the self-same wine are little manchets made,
Against the boisterous winter storms, and sundry such-like
trades;
The men upon this solemn day do take this holy wine
To make them strong; so do the maids to make them fair and
fine."

December 28.—Feast of the Holy Innocents.

This anniversary, which is also called CHILDERMAS-DAY, has been celebrated from the primitive times of Christianity in commemoration of the slaughter of the infants of Bethlehem. In the middle ages it was usual to "whip up" the children upon the morning of the holiday, "that the memory of Herod's murder of the Innocents might stick the closer, and in a moderate proportion to act over the cruelty again in kind." Childermas-day was also deemed of especial bad omen; no one married upon it; and our forefathers considered it unlucky to put on a new suit of clothes, pare their nails, or begin anything of importance on this festival.

December 31.—New Year's Eve.

The last day of the year was spent among our "labouring ancestors" in festivity and frolic among the men; and the young women carried from door to door a wassail-bowl of spiced ale, "which," says Hone, "they offered to the inhabitants of every house they stopped at, singing rude congratulatory verses, and hoping for small presents." Young men and women also exchanged clothes, which was termed mummung, or disguising; and when thus dressed in each other's garments, they went from one neighbour's cottage to another, singing, dancing, and packing of good cheer.

Hutchinson, in his *History of Cumberland*, speaking of the parish of Muncaster, remarks: "On the eve of the new year the children go from house to house singing a ditty which craves the bounty 'they were wont to have in old King Edward's days.' There is no tradition whence this custom rose; the donation is twopence, or a pie at every house."

The great moralist, Dr. Johnson, in his *Journey to the Western Islands of Scotland*, says, that a gentleman informed him that, at New Year's Eve, in the hall or castle of the laird, where on festivals there is supposed to be a very numerous company, one man dresses himself in a cow-hide, on which other men beat with sticks; he runs with all this noise round the house, which all the company quits in a counterfeited fright; the door is then shut, and no re-admission obtained after their pretended terror but by the repetition of a verse of poetry, with which those acquainted with the custom are provided. The author of the *Traditions of Edinburgh* states, that in Scotland the last day of the year is universally styled Hogmanay, and observed as a high festival, both by old and young, but especially by the latter. It is still customary, he tells us, in retired and primitive towns, for the children of the poorer class of people to get themselves on that morning swaddled up in a great

sheet, doubled up in front, so as to form a vast pocket, and then to go along the streets in little bands, calling at the doors of the wealthier classes for an expected dole of oaten bread. Each child gets one "quadrant" section of oat-cake (sometimes in the case of particular favourites improved by an addition of cheese), and this is called their *hogmanay*. In expectation of the large demands thus made upon them, the housewives busy themselves, for several days beforehand, in preparing a suitable quantity of cakes. The children, on coming to the door, cry "Hogmanay!" which is in itself a sufficient announcement of their demands; but there are other exclamations which are used for the same purpose. One of these is—

"Hogmanay

Trollolay;

Give us of your white bread, and none of your gray!"

Another is—

"Get up, gudewife, and shake your feathers,
And dinna think that we are beggars;
For we are bairns come out to play;
Get up and gie's our hogmanay!"

A third, and the greatest favourite of all, is—

"My feet's cauld, my shoon's thin,
Gie's a piece and let's rin!"

"It is no unpleasant scene," says the author before mentioned, "during the forenoon, to see the children going laden home, each with his large apron bellying out before him, stuffed full of cakes, and perhaps scarcely able to waddle under the load. Such a mass of oaten alms is no inconsiderable addition to the comfort of the poor man's household, and tends to make the season still more worthy of its jocular title."

THE ORIGINAL ARTIST.¹

As I was lounging one fair and very warm morning on the *Lerée* at New Orleans, I chanced to observe a gentleman whose dress and other accompaniments greatly attracted my attention. I wheeled about, and followed him for a short space, when, judging by everything about him that he was a true original, I accosted him. But here, kind reader, let me give you some idea of his exterior. His head was covered by a straw hat, the brim of which might cope with those worn by the fair sex in 1830; his neck was exposed to the weather; the broad frill of a shirt, then fashionable, flapped about his breast; whilst an extraordinary collar, carefully arranged, fell over the top of his coat. The latter was of a light green colour, harmonizing well with a pair of flowing yellow nankeen trousers, and a pink waistcoat, from the bosom of which, amidst a large bunch of the splendid flowers of the Magnolia, protruded part of a young alligator, which seemed more anxious to glide through the muddy waters of some retired swamp, than to spend its life swinging to and fro among folds of the finest lawn. The gentleman held in one hand a cage full of richly-plumed nonpareils, whilst in the other he sported a silk umbrella, on which I could plainly read, "*Stolen from I,*" these words being painted in large white characters. He walked as if conscious of his own importance, that is, with a good deal of pomposity, singing, "My love she's but a lassie yet," and that with such thorough imitation of the Scotch emphasis, that had not his physiognomy brought to my mind a denial of his being from "within a mile of Edinburgh," I should have put him down in my journal for a true Scot. But no:—his *tourneur*, nay, the very shape of his visage, pronounced him an American, from the farthest parts of our eastern Atlantic shores.

All this raised my curiosity to such a height, that I accosted him with, "Pray, Sir, will you allow me to examine the birds you have in that cage?" The gentleman

(1) From Audubon's Ornithological Biography.

stopped, straightened his body, almost closed his left eye, then spread his legs apart, and, with a look altogether quizzical, answered, "Birds, Sir, did you say birds?" I nodded, and he continued, "What do you know about birds, Sir?"

Reader, this answer brought a blush into my face. I felt as if caught in a trap, for I was struck by the force of the gentleman's question; which, by the way, was not much in discordance with a not unusual mode of granting an answer in the United States. Sure enough, thought I, little or perhaps nothing do I know of the nature of those beautiful denizens of the air; but the next moment vanity gave me a pinch, and urged me to conceive that I knew at least as much about birds as the august personage in my presence. "Sir," I replied, "I am a student of nature, and admire her works, from the noblest figure of man to the crawling reptile which you have in your bosom." "Ah!" replied he, "a-a-a naturalist, I presume!" "Just so, my good Sir," was my answer. The gentleman gave me the cage; and I observed from the corner of one of my eyes, that his were cunningly inspecting my face. I examined the pretty finches as long as I wished, returned the cage, made a low bow, and was about to proceed on my walk, when this odd sort of being asked me a question quite accordant with my desire of knowing more of him. "Will you come with me, Sir? If you will, you shall see some more curious birds, some of which are from different parts of the world. I keep quite a collection." I assured him I should feel gratified, and accompanied him to his lodging.

We entered a long room; there, to my surprise, the first objects that attracted my attention were a large easel, with a full-length unfinished portrait upon it, a table with pallets and pencil, and a number of pictures of various sizes placed along the walls. Several cages containing birds were hung near the windows, and two young gentlemen were busily engaged in copying some finished portraits. I was delighted with all I saw. Each picture spoke for itself; the drawing, the colouring, the handling, the composition, and the keeping—all proved, that, whoever was the artist, he certainly was possessed of superior talents.

I did not know if my companion was the painter of the picture, but, as we say in America, I strongly guessed, and, without waiting any longer, paid him the compliments which I thought he fairly deserved. "Aye," said he, "the world is pleased with my work; I wish I were so too, but time and industry are required as well as talents, to make a good artist. If you will examine the birds, I'll to my labour." So saying, the artist took up his pallet, and was searching for a rest-stick, but not finding the one with which he usually supported his hand, he drew the rod of a gun, and was about to sit, when he suddenly threw down his implements on the table, and, taking the gun, walked to me, and asked me "if I had ever seen a percussion-lock." I had not, for that improvement was not yet in vogue. He not only explained the superiority of the lock in question, but undertook to prove that it was capable of acting effectually under water. The bell was rung, a flat basin of water was produced, the gun was charged with powder, and the lock fairly immersed. The report terrified the birds, causing them to beat against the gilded walls of their prisons. I remarked this to the artist. He replied, "Hang the birds!—more of them in the market; why, Sir, I wish to show you that I am a marksman as well as a painter." The easel was cleared of the large picture, rolled to the further end of the room, and placed against the wall. The gun was loaded in a trice, and the painter counting ten steps from the easel, and taking aim at the supporting pin on the left, fired; the bullet struck the head of the wooden pin fairly, and sent the splinters in all directions. "A bad shot, Sir," said this extraordinary person; "the ball ought to have driven the pin farther into the hole, but it struck on one side; I'll try at the hole itself!" After reloading his

piece, the artist took aim again, and fired. The bullet this time had accomplished its object, for it had passed through the aperture, and hit the wall behind. "Mr.—ring the bell and close the windows," said the painter; and turning to me, continued, "Sir, I will show you the *ne plus ultra* of shooting." I was quite amazed, and yet so delighted, that I bowed my assent. A servant having appeared, a lighted candle was ordered. When it arrived, the artist placed it in a proper position, and retiring some yards, put out the light with a bullet. When light was restored, I observed the uneasiness of the poor little alligator, as it strove to effect its escape from the artist's waistcoat. I mentioned this to him. "True, true," he replied, "I had quite forgot the reptile, he shall have a dram;" and unbuttoning his vest, unclasped a small chain, and placed the alligator in the basin of water on the table.

Perfectly satisfied with the acquaintance I had formed with this renowned artist, I wished to withdraw, fearing I might inconvenience him by my presence. But my time was not yet come. He bade me sit down, and paying no more attention to the young pupils in the room than if they had been a couple of cabbages, said, "If you have leisure and will stay awhile, I will show you how I paint, and will relate to you an incident of my life, which will prove to you how sadly situated an artist is at times." In full expectation that more eccentricities were to be witnessed, or that the story would prove a valuable one, even to a naturalist, who is seldom a painter, I seated myself at his side, and observed with interest how adroitly he transferred the colours from his glistening pallet to the canvass before him. I was about to compliment him on his facility of touch, when he spoke as follows:—

"This is, Sir, or, I ought to say rather, this will be the portrait of one of our best navy officers, a man as brave as Cæsar, and as good a sailor as ever walked the deck of a seventy-four. Do you paint, Sir?" I replied, "Not yet."—"Not yet! What do you mean?"—"I mean what I say: I intend to paint as soon as I can draw better than I do at present."—"Good," said he, "you are quite right; to draw is the first object; but, Sir, if you should ever paint, and paint portraits, you will often meet with difficulties. For instance, the brave commodore of whom this is the portrait, although an excellent man at everything else, is the worst sitter I ever saw; and the incident I promised to relate to you, as one curious enough, is connected with this bad mode of sitting. Sir, I forgot to ask if you would take any refreshment—a glass of wine, or—." I assured him I needed nothing more than his agreeable company, and he proceeded:—"Well, Sir, the first morning that the commodore came to sit, he was in full uniform, and with his sword at his side. After a few moments of conversation, and when all was ready on my part, I bade him ascend this throne, place himself in the attitude which I contemplated, and assume an air becoming an officer of the navy. He mounted, placed himself as I had desired, but merely looked at me as if I had been a block of stone. I waited a few minutes, when, observing no change on his placid countenance, I ran the chalk over the canvass to form a rough outline. This done, I looked up to his face again, and opened a conversation, which I thought would warm his warlike nature; but in vain. I waited and waited, talked and talked, until my patience—Sir, you must know I am not overburdened with phlegm—being almost run out, I rose, threw my palette and brushes on the floor, stamped, walking to and fro about the room, and vociferated such calumnies against our navy, that I startled the good commodore. He still looked at me with a placid countenance, and as he has told me since, thought I had lost my senses. But I observed him all the while, and, fully as determined to carry my point as he would be to carry off an enemy's ship, I gave my oaths additional emphasis, addressed him as a representative of the navy, and, steering somewhat clear of personal insult, played off my batteries

against the craft. The commodore walked up to me, placed his hand on the hilt of his sword, and told me, in a resolute manner, that if I intended to insult the navy, he would instantly cut off my ears. His features exhibited all the spirit and animation of his noble nature; and as I had now succeeded in rousing the lion, I judged it time to retreat. So, changing my tune, I begged his pardon, and told him he now looked precisely as I wished to represent him. He laughed, and returning to his seat, assumed a bold countenance. And now, Sir, see the picture."

Biographical Sketches of Eminent Painters.

GUIDO RENI.

GUIDO RENI, generally called Guido, was born at Bologna in 1574, and was the son of Daniel Reni, an excellent musician of that city.

Guido received his first instruction in painting from Denis Calvart, a highly esteemed Flemish artist; but he soon quitted him, and became a disciple of the Caracci, whose style he studied with much attention.

He then visited Rome; and although the works of Raphael inspired him with the greatest enthusiasm, he was dazzled by the surprising effect of Caravaggio's painting, and imitated his manner for a time, but afterwards abandoned it, by the advice of Annibal Caracci, who was then employed at Rome.

Guido now evinced that genius which has rendered him so justly celebrated, and he adopted a style which was at once grand, elegant, and graceful. Giuseppe Cesar d'Arpino—better known by the appellation of Gioseppino Cavaliere—who was the formidable rival of Caravaggio, took great pleasure in extolling the new manner of Guido, in order to excite the envy of his antagonist. This drew upon Guido the resentment of the imperious Caravaggio, who depreciated his works wherever he went, and even added threats to injury. Guido conducted himself with the greatest moderation, but it is supposed that he hastened his return to Bologna in consequence of the hostile behaviour of Caravaggio.

His fame, however, continued to increase, and he was recalled to Rome by Pope Paul V., who employed and rewarded him liberally.

Among the celebrated painters of that period who were opposed to Guido was Domenichino, with whom he entered into competition to paint the martyrdom of St. Andrew. Guido was eminently successful on this occasion, though Annibal Caracci did not give him his suffrage. Indeed, some good judges have declared that Guido's paintings are not always so true to nature as those of Domenichino; but in delicacy of idea, elegance of design, freedom of pencil, and general effect, Guido has rarely been surpassed. Tender, pathetic, and devout subjects were those in which he particularly excelled.

His heads are remarkable for grace, and an engaging propriety of expression, worthy of the pencil of Raphael himself. The form and air of his figures are extremely beautiful, whilst the general arrangement of his objects, and his astonishingly clear and pure colouring, deserve the highest praise. His draperies are always disposed with singular taste and judgment; they are noble and elegant, without the least stiffness or affectation.

Though deficient in the knowledge of the princi-

ples of the chiaro-scuro, Guido's genius enabled him to practise it with success. He bestowed much labour on his pictures, which were highly finished; but he generally gave some bold touches to his works, in order that it might not be supposed that he had devoted so much time to them.

Guido's demeanour when in his painting-room was very haughty, and he exacted the utmost respect from his pupils. He never removed his cap from his head in the presence of his visitors, however elevated their rank might be; but in society he was courteous and modest.

It is melancholy to relate that the latter days of this great painter were rendered miserable by his unhappy inclination for gambling. In other respects his life was irreproachable; but this deplorable propensity not only reduced him to indigence, but deprived him of his friends, and ruined the energies of his mind. In his declining years he was absolutely compelled to work for his daily subsistence, and this gave him a habit of painting in a hurried and negligent manner, which was so different from his former careful and finished style.

He died in the year 1642, aged sixty-eight.

In the church of St. Philip Neri, at Fano, there is a grand altar-piece by Guido, representing our Saviour delivering the keys to St. Peter. At Milan is a St. John, which is beautiful in respect of colouring and grace of design.

In the palazzo Tanaro, at Bologna, is an excellent picture of the Infant Jesus, the Virgin Mary, and St. John. The heads and the draperies are in that graceful and noble style for which Guido was so celebrated.

The martyrdom of St. Peter was considered to be one of the finest altar-pieces in Rome. It was painted by Guido when he was anxious to adopt the manner of Caravaggio, and he is said to have imitated him most successfully in this composition.

According to tradition, St. Peter was condemned to be crucified about the year of our Lord 68, in the reign of Nero; but, considering himself unworthy of suffering the same death as our blessed Saviour, he obtained permission to be crucified with his head downwards.

This picture is now in the Vatican. It is painted on wood, and is about nine feet and a half high, and seven wide. A fine copy of it, in mosaic, may be seen in the church of St. Peter at Rome.

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

"LOVE NOT," REBUKED.

R. H. B.

"Love not; the earth is filled with woe,
And he that lives on love below,
Must soon his brightest hopes forego."

Nay, traitor, 'tis love's best employ
To heal this evil world's annoy,
And turn its bitter things to joy.

"Love is a frail and stayless shoot;
Ye deem 'twill bear you golden fruit,
Nor wist 'tis rotten at the root."

False prophet, in a soil that's kind
No plant a firmer hold can find,
Or spread more freely to the wind.

Deep rooted in a kindred soil,
It bids the tempest strain and toil,
And laughs to scorn its vain turmoil.

"Love is a summer bird that flies
The first dark frown of wintry skies,
Or quickly sickens, droops, and dies."

It is not so, but ever near,
It haunts our homesteads all the year,
And in the winter gives us cheer.

"Love not, the thing you love may change,
And looks once fond grow cold and strange,
Seeking abroad some wider range."

True love that once hath found its home
There rests, and hath no will to roam;
No time can mar, no change can come.

"Love not, the thing you love may die,
And 'tis the worst of misery
To mourn for happy days gone by."

Love dies not, tho' the cord be riven
That binds the sense, nor room be given
To rest on earth; it lives in heaven.

"Be wise in time, nor strive in vain
To shun the inevitable chain
Of that thine only birth-right—Pain."

False counsellor, 'twas God that wove
The golden threads of holy love,
To link mankind with things above.

Love keeps the world; hence all derive
That life which it alone can give:
By love the very angels live.

Talk not of change, nor dare defame
By baser things so pure a name,
If love be true, 'tis aye the same.

Talk not of change, heaven's dearest boon
Is linking two fond hearts in one,
There perfecting what here begun.

Then bid me not to cast away
What God hath given us for a stay,
To cheer us in earth's evil day.

Nay, rather close and closer twine
Around this yearning heart of mine
Those earthly bonds, yet bonds divine.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

KING JAMES THE SECOND IN EXILE.

A PORTION of the private suite of the apartments of the king and queen at St. Germain remain unaltered. King James's morning room, or cabinet, with its dark green and gold panelling, and richly carved cornice, presents a melancholy appearance of faded splendour. It opens with glass doors upon the stately balcony that surrounds the chateau, and commands a charming and extensive prospect. It was here that the fallen king retired to read or write. This room communicated with the queen's bed-chamber by a private stair; and, indeed, with the whole of that wing of the palace, by a number of intricate passages which lie behind it. In one of the lobbies there is a small square window, which commands a view of the royal closet, so that anybody ambushed there might look down upon his majesty and watch all his proceedings. A pleasing tradition, connected with this window, was related to me by a noble lady, whose great-grandmother, Mrs. Plowden, was one of the ladies in the household of Queen Mary Beatrix. Mrs. Plowden's infant family lived with her in the palace of St. Germain; and she sometimes found it necessary, by way of punishment, to shut up her little daughter Mary (a pretty spoiled child, of four years old,) in the lobby

leading from her own apartment to the queen's back-stairs; but the young lady always obtained her release by climbing to the little window that looked down into the king's closet, and tapping at the glass till she had attracted attention; then, showing her weeping face, and clasping her hands in an attitude of earnest entreaty, she would cry, in a sorrowful tone, "Ah! Sir, send for me!" James, unless deeply engaged in business of importance, always complied with the request of the tearful petitioner, for he was very fond of children; and when Mrs. Plowden next entered the royal presence with the queen, she was sure to find her small captive closeted with his majesty, sitting at his feet, or sometimes on his knee. At last she said to the king, "I know not how it happens, but whenever my little girl is naughty, and I shut her up in the lobby, your majesty does her the honour of sending for her into your closet." James laughed heartily, and pointing to the window above, explained the mystery.—*Strickland's Queens of England*.

THE FROZEN DEAD AT THE HOSPICE OF THE GRAND ST. BERNARD.

THE scene of the greatest interest at the Hospice—a solemn, extraordinary interest indeed—is that of the Morgue, or building where the dead bodies of lost travellers are deposited. There they are, some of them as when the breath of life departed, and the Death Angel, with his instruments of frost and snow, stiffened and embalmed them for ages. The floor is thick with nameless skulls and bones, and human dust heaped in confusion. But around the wall are groups of poor sufferers in the very position in which they were found, as rigid as marble, and in this air, by the preserving element of an eternal frost, almost as crumpling. There is the mother and a child, a most affecting image of suffering and love. The face of the little one remains pressed to the mother's bosom, only the back part of the skull being visible, the body enfolded in her careful arms, careful in vain, affectionate in vain, to shield her offspring from the elemental wrath of the tempest. The snow fell fast and thick, and the hurricane wound them up in one white shroud and buried them. There is also a tall, strong man, standing alone, the face dried and black, but the white unbroken teeth firmly set and close, grinning from the fleshless jaws—it is a most awful spectacle. The face seems to look at you from the recesses of the sepulchre, as if it would tell you the story of a fearful death-struggle in the storm. There are other groups more indistinct; but these two are never to be forgotten, and the whole of those dried and frozen remnants of humanity are a terrific demonstration of the fearfulness of this mountain pass, when the elements, let loose in fury, encounter the unhappy traveller. You look at all this through the grated window: there is just light enough to make it solemnly and distinctly visible, and to read in it a powerful record of mental and physical agony, and of maternal love in death. The little child, hiding its face in its mother's bosom, and both frozen to death—one can never forget the group, nor the momento mori, nor the token of deathless love.—*Dr. Cheever's Wanderings*.

N.B. The Second Volume of this Periodical is now ready; covers for binding, with table of contents, may be ordered of any Book-seller.

The Mother's Hope.

Lo! at the couch where infant beauty sleeps,
Her silent watch the mournful mother keeps!
She, while the lovely babe unconscious lies,
Smiles on her slumbering child with pensive eyes,
And weaves a song of melancholy joy—
"Sleep, image of thy father, sleep, my boy;
No lingering hour of sorrow shall be thine;
No sigh that rends thy father's heart and mine.
Bright as his manly sire the son shall be
In form and soul, but, oh! more blest than he!
Thy fame, thy worth, thy filial love at last,
Shall soothe his aching heart for all the past—
With many a smile my solitude repay,
And chase the world's ungenerous scorn away.

And say, when summon'd from the world and thee,
I lay my head beneath the willow tree,
Wilt thou, sweet mourner! at my stone appear,
And soothe my parted spirit lingering near?
Oh, wilt thou come at ev'ning hour to shed
The tears of mem'ry o'er my narrow bed;
With aching temples on the hand reclined,
Muse on the last farewell I leave behind,
Breathe a deep sigh to winds that murmur low,
And think on all my love, and all my woe?"

CAMPBELL.

FRANK FAIRLEIGH;
OR, OLD COMPANIONS IN NEW SCENES.
By F. E. S.

TO THE READER.

READER! Mysterious being, whose name is Legion, (for who is there that peruseth not the pages of Sharpe!) thou that art variform as the fabled Proteus, and many-minded, as the units of which thou art composed are numerous, and dost yet possess a congregate opinion, and general voice, which is all-powerful! Stranger, to whom are confided thoughts and feelings, of which not only my most chosen friends are ignorant, but which I have scarcely dared definitely to acknowledge to my own heart!—once more am I about to renew my singular intercourse with thee.

Reader, hast thou forgotten "Frank Fairleigh?" Are the "Scenes from the Life of a Private Pupil," completely banished from thy memory? Surely it is not so. It cannot be that the pleasant friendship existing between us is to terminate thus abruptly. Rather will I believe that we meet again as old friends should do, with a hearty shake of the hand, and a feeling of mutual pleasure.

"Why, Frank, you have become a man since we last parted." Even so, dear reader, and many strange events have occurred in the interval; events which, for me, have possessed a peculiar interest; whether they are likely to inspire you with aught of the same feeling, you will be able to judge when you have perused the following pages.

CHAP. I.

INTRODUCTORY.

For some months after my father's death, I continued to live at the rectory; Mr. Dalton, the new incumbent, who had been his curate, and was unmarried, kindly allowing my mother to remain there till her plans for the future should be so far arranged, as to enable her to determine in what part of the country it would be advisable for her to reside. It had been my father's wish and intention, when I should have attained a fit age, to send me to one of the universities; a wish my mother was most anxious to carry into effect. In order to accomplish this with her reduced means, it would have been necessary for her, not only to have practised the strictest economy, but also, in great measure, to have sacrificed my sister's education, as she would have been utterly unable to afford her the advantage of masters. To this, of course, I would not consent; after much discussion, therefore, the idea of college was reluctantly given up, and, as a last resource, my mother applied to an uncle of hers, engaged in the West India trade, begging him to endeavour to procure for me a clerkship in some mercantile establishment. She received a very kind reply, saying that, although he considered me too young at present to be chained to a desk, he should advise me to apply myself diligently to the study of French and book-keeping; and ending by offering me a situation in his own counting-house, when I should be eighteen. As my only alternative lay between accepting this offer, (however little suited to my taste,) or remaining a burden upon my mother, it may easily be imagined that I lost no time in signifying my desire to avail myself of his kindness; and, ere a couple of months had elapsed, I had plunged deeply into the mysteries of book-keeping, and could jabber French with tolerable fluency. I was still working away at "Double Entry," and other horrors of a like nature, when one morning I received a large business-like letter, in an unknown hand, the contents of which astonished me not a little, as well they might; for they proved to be of a nature

once more entirely to change my prospects in life. It came from Messrs. Coutts, the bankers, and stated that they were commissioned to pay me the sum of 400*l.* per annum, in quarterly payments, for the purpose of defraying my expenses at college; the only stipulations being, that the money should be used for the purpose specified, that I did not contract any debts whatsoever, and that I made no inquiries, direct or indirect, as to the source from which the sum proceeded. In the event of my complying with these conditions, the same allowance was to be continued to me till I should have taken my degree.

The immediate consequence of this most unexpected communication was, our devoting the greater part of a morning to vain speculations as to the possible source from which this liberal offer might have proceeded. After guessing every one we could think of, likely or unlikely, we ended, as is usual in such cases, by becoming more puzzled, if possible, than when we began. The only person with whom I was acquainted, possessing both the will and the power to do such a thing, was Sir John Oaklands; but he had already, in the kindest manner, tried to persuade my mother to allow me to accompany Harry to Trinity College, Cambridge, begging to be permitted to defray the expenses of my so doing himself; an offer which she (not choosing to place herself under so heavy an obligation to a comparative stranger) had, with many expressions of gratitude, declined. After consulting with our friend, Mr. Dalton, it was decided that I should signify to Messrs. Coutts my readiness to comply with the required conditions, begging them to convey my best thanks to my mysterious benefactor, and to inform him, that it was my intention (subject to his approval) to enter my name at Trinity, without loss of time. In answer to this, I received the following laconic epistle:—"Messrs. Coutts beg to inform Mr. Frank Fairleigh, that, in reply to his favour of the 21st ult., they are desired to state, that the sum of 400*l.* per annum will be placed at his disposal, whenever he applies for it."

I now resumed my studies under the superintendence of Mr. Dalton, who had taken a good degree at Cambridge; and, alike delighted at my escape from the counting-house, and anxious to do credit to my benefactor's liberality, I determined to make the best use of my time, and worked *con amore*. In this manner, the next year and a half passed away without any thing worthy of remark occurring. I was happy to perceive a gradual improvement taking place in my mother's health and spirits, while Fanny was developing into a very pretty and agreeable girl.

Towards the expiration of this period, Mr. Dalton saw fit to take unto himself a wife, a circumstance which induced my mother to accept the offer of a cottage belonging to Sir John Oaklands, which was suited to her limited means. It was situated within the park-gates, about a mile from Heathfield Hall, and, though small, was well built, and exceedingly pretty.

This was an arrangement of which I highly approved, as it enabled me to renew my intercourse with Harry, who, having left Dr. Mildman's, was spending a few months at home with his father, previous to his matriculation at Trinity. I found him but little altered in any respect, save that he had become more manly looking. For the rest, he was just as good-tempered, kind-hearted, and, alas! indolent, as ever. He informed me, that Lewis also was going to Cambridge, and that Coleman, when he learned what a party of us there would be, had been most anxious to accompany us; but his father, unfortunately, did not approve, and he was now obliged to a solicitor, with a view to his succeeding eventually to his father's practice.

Time rolled on, and another three months beheld us duly installed in our rooms at Trinity, our evenings our time between reading (more or less, in accordance with our various idiosyncrasies,) boating on the Cam, billiard-playing at Chesterton, *et hoc genus omne*.

Of my college life I shall say but little, a piece of forbearance for which I consider myself entitled to the everlasting gratitude of my readers, who, if they have not had their curiosity on that subject more than satisfied by the interminable narrations of "Peter Priggins," and his host of imitators, must indeed be insatiable. Suffice it then to say, that, having from the first determined, if possible, to obtain a good degree, I made a resolute stand against the advances of Lawless (who, in consequence of his father's having, for some reason best known to himself and the premier, received a peerage, had now become an "honourable,") and the "rowing set," amongst whom, by a sort of freemasonry of kindred souls, he had become enrolled immediately on his arrival. After several fruitless attempts to shake my determination, they pronounced me an incorrigible "sap," and, leaving me to my own devices, proceeded to try their powers upon Oaklands. They met with but little success in this quarter, however; not that with him they had any indomitable love of study to contend with, but that "all that sort of thing was too much trouble; he really didn't believe there was a single fellow among the whole lot who had the slightest appreciation of the *dolce far niente*." When, however, they found out that upon an emergency Harry could excel them all, whatever might be the nature of the feat to be performed,—and that I could cross a country, pull an oar, or handle a bat, with the best of them, they set us down as a pair of eccentric geniuses, and as such admitted us to a kind of honorary membership in their worshipful society; and thus, 'twixt work and play, the first two years of my residence at Cambridge passed happily enough.

CHAP. II.

CATCHING A SHRIMP.

"A mighty stupid chapter that last!" "'True for you,' reader; but how was it to be avoided? It was necessary to give you that short summary of my proceedings, the better to enable you to understand all that is to follow; and so, don't you see?"—"Yes, that will do. Above all things, Master Frank, avoid being proxy; it is the worst fault an author can fall into." "Reader, you're very cross."

It was towards the close of the long vacation, that, one morning, as I was sitting at breakfast with my mother and sister, a note was brought to me. On opening it, it proved to be from Coleman, whose father had lately taken a country house near Hillingford, a small town about fifteen miles from Heathfield, where he was now about to give a grand ball to all the neighbourhood by way of house-warming. At this ball Freddy (with whom I had kept up a constant correspondence, though we had never met since I left Dr. Mildman's,) was most anxious I should be present, and his letter was really a master-piece of persuasion; not only should I meet all the beauty and fashion of the county, but he had for some days past employed himself in paving the way for me with several of the most desirable young ladies of his acquaintance, who were now, as he assured me, actually pining to be introduced to me. Moreover, the Honourable George Lawless had promised to be there; so we were safe for fun of some sort, Lawless's tastes and habits being about as congenial to the atmosphere of a ball-room, as those of a bull to the interior of a china-shop.

These manifold temptations, together with the desire of again meeting Freddy himself, proved irresistible, and I decided to go. Oaklands, who had received a similar invitation, was unluckily not able to accept it, as his father had fixed a shooting-party for that day, at which, and at the dinner which was to follow, Harry's presence was indispensable.

It was in the afternoon of a glorious September day that I set off on horseback for Hillingford. I had accompanied the sportsmen in the morning, and had walked just enough to excite without fatiguing myself;

and new the elastic motion of the horse (a powerful hunter of Sir John's),—the influence of the fair scene around me, as I cantered over the smooth turf of Heathfield-park, and along the green lanes beyond it,—the prospect of seeing again an old companion of my boyhood's days,—all contributed to produce in me an exhilaration of spirits which seemed to raise me above the "Kleinigkeiten," the littlenesses (as the Germans so well express it) of this world, and to exalt me to some higher and nobler sphere. Out of this day-dream I was at length aroused by the clatter of horses' feet, and the rattle of wheels in the lane behind me, while a man's voice, in tones not of the most gentle description, accosted me as follows:—"Now then, sir, if you've got a license to take up the whole road, I'll just trouble you to show it!" With a touch of the spur I caused my horse to bound on one side, and, as I did so, I turned to look at the speaker. Perched high in mid-air, upon some mysterious species of dog-cart, bearing a striking resemblance to the box of a mail-coach, which had contrived, by some private theory of development of its own, to dispense with its body, while it had enlarged its wheels to an almost incredible circumference; perched on the top of this remarkable machine, and enveloped in a white great coat, undermined in every direction by strange and unexpected pockets, was none other than the Honourable George Lawless! The turn-out was drawn by a pair of thorough-breds, driven tandem, which were now (their irascible tempers being disturbed by the delay which my usurpation of the road had occasioned,) relieving their feelings by executing a kind of hornpipe upon their hind-legs. The equipage was completed by a tiger, so small, that beyond a vague sensation of top-boots and a livery hat, one's senses failed to realize him.

"Why, Lawless!" exclaimed I; "you are determined to astonish the natives, with a vengeance: such a turn-out as that has never been seen in these parts before, I'm certain."

"Frank Fairleigh, by Jove! How are you, old fellow! Is it my trap you're talking about? what do you think of it? rather the thing, isn't it, eh?" I signified my approval, and Lawless continued, "Yes, it's been very much admired, I assure you—quiet! Marc, quiet!—not a bad sort of thing to knock about in, eh?—What are you at, fool?—Tumble out, Shrimp, and hit Spiteful a flick on the nose—he's eating the mare's tail. Spiccy tiger, Shrimp—did you ever hear how I picked him up?" I replied in the negative, and Lawless resumed—"I was down at Broadstairs the beginning of the long—wretched place, but I went down for a boat-race with some more fellows; well, of course, because we wanted it to be fine, the weather turned sulky, and the boat-race had to be put off; so, to prevent ourselves from going melancholy mad, we hired a drag, and managed to get together a team, such as it was. The first day we went out they elected me waggoner, and a nice job I had of it; three of the horses had never been in harness before, and the fourth was a bolter. It was pretty near half an hour before we could get them to start; and, when they were off, I had enough to do to keep their heads out of the shop windows. However, as soon as they began to get warm to their work, things improved, and we rattled along merrily. We were spinning away at about twelve miles an hour, when, just as we were getting clear of the town, we came suddenly upon a covey of juvenile blackguards, who were manufacturing dirt pies right in the centre of the road. As soon as I saw them, I sung out to them to clear the course, but before they had time to cut away, we were slap into the middle of them. Well, I thought it was going to be a regular case of Herod, and that there would be at least half-a-dozen of them spifficated, but they all managed to save their bacon except Shrimp,—one of the wheels went over him, and broke him somewhere. Where was it, Shrimp?"

"Left arm, Sir, if you please," replied Shrimp, in a shrill treble.

"Aye, so it was," continued Lawless. "As soon as I could contrive to pull up, I sent the groom back, with orders to find a doctor, get the boy repaired, and tell them to come to me at the hotel in the morning, and I'd pay for all damages. Accordingly, while I was eating my breakfast next morning, an amphibious old female in a blue pea-jacket was shown in to me, who stated she was Shrimp's mother. First, she was extremely lacrymose, and couldn't speak a word; then she got the steam up, and began slanging me till all was blue; I was 'an unchristianlike, hard-hearted, heathen Turk, so I was, and I'd been and spoiled her sweet boy completely, so I had; such a boy as he was too, bless him, it was quite a sight to hear him say his Catechism; and as to reading his book, he'd beat the parson himself into fits at it.' Fortunately for me, she was a little touched in the wind, and when she pulled up to take breath for a fresh start, I managed to cut in. 'I tell you what it is, old lady,' said I, 'there's no need for you to put yourself into a fury about it; misfortunes will happen in the best regulated families, and it seems to me a boy more or less can make no great odds to any one—no fear of the breed becoming extinct just at present, if one may judge from appearances; however, as you seem to set a value upon this particular boy, I'll tell you what I'll do: I'll buy him of you, and then, if anything should go wrong with him, it will be my loss, and not yours. I'll give you 20*l.* for him, and that's more than he would be worth if he was sound.' By Jove, the old girl brightened up in a moment, wiped her eyes with the sleeve of her coat, and said—'Five pounds more, and it's a bargain.' And the end of it all was, the brat got well before I left the place, I paid the old woman her money, and brought Shrimp away with me, and it hasn't turned out such a bad spec either, for he makes a capital tiger, and now I've broken him in, I would not take twice the money for him. You'll be at old Coleman's hop to-night, I suppose; so *au revoir!*"

Thus saying, he drew the whip lightly across the leader's back, the horses sprang forward, and in another moment he was out of sight.

Half an hour's ride brought me within view of Elm Lodge, the house lately taken by Mr. Coleman, senior. As I rang at the bell, a figure leaped out of one of the front windows, and came bounding across the lawn to meet me, and in another minute my hand was seized, and my arm nearly shaken off, by Coleman.

"Freddy, old boy!" "Frank, my dear old fellow!" were our mutual exclamations, as we once more shook hands with an energy which must have highly edified a pompous footman, whom my ring had summoned. After the first excitement of our meeting had a little subsided, we found time to examine each other more minutely, and note the changes a couple of years had wrought in us. Coleman was the first to speak.

"Why, Frank, how you are altered!"

"If you were but decently civil, you would say 'improved' instead of 'altered,'" replied I, "but you'll never learn manners."

"Oh, if you want compliments, I'll soon get up a few, but it strikes me they are not required. A man with such a face and figure as yours soon finds out that he is a deucedly good-looking fellow. Why, how high do you stand?"

"About six feet without my boots," replied I, laughing at Coleman, who kept turning me round, and examining me from top to toe, as if I had been some newly-discovered animal.

"Well, you are a screamer, and no mistake," exclaimed he at length. "Be merciful towards the young ladies to-night, or the floor will be so cumbered with the heaps of slain, that we shall have no room to dance."

"Never fear," rejoined I, "the female breast is not so susceptible as you imagine, and I'll back your bright eyes and merry smile to do more execution than my long legs and broad shoulders any day."

"No soft sawder, Master Frank, if you please; it's an article for which I've a particular distaste; people never

make pretty speeches to one's face without laughing at one behind one's back afterwards, by way of compensation."

"Which rule of course applies to the remarks you have just been making about me," returned I.

"You've caught me there fairly," laughed Coleman, "but come along in now, I want to introduce you to my mother and the governor; they are longing to see you, after all I've told them about you, though I can't say you look much like the thin delicate boy I have described you."

Mr. Coleman, who was a short, stout, red-faced old gentleman, with a bald head, and a somewhat pompous manner, came forward and welcomed me warmly, saying all sorts of complimentary things to me, in extremely high-flown and grandiloquent language; and referring to my having saved his son's life, in doing which, however, he quite won my heart, by the evident pride and affection with which he spoke of Freddy. The lady of the house was a little, round, merry-looking woman, chiefly remarkable (as I soon discovered) for a peculiar mental obliquity, leading her always to think of the wrong thing at the wrong time, whereby she was perpetually becoming involved in grievous colloquial entanglements, and meeting with innumerable small personal accidents, at which no one laughed so heartily as herself.

About half-past nine that evening, some of the guests began to arrive, amongst the foremost of whom was Lawless, most expensively got up for the occasion, in a stock and waistcoat, which, as Coleman observed, required to be seen ere they could be believed in. As the arrivals succeeded each other more rapidly, and the rooms began to fill, Lawless took me by the arm, and led me to a corner, whence, unnoticed ourselves, we could observe the whole scene.

"This will be a very full meet, Fairleigh," he began, "I'm getting confoundedly nervous, I can tell you; I'm not used to this sort of affair, you know; I used always to shirk everything of the kind, but my Mater has got it into her head, since she's become My Lady, that she must flare up and give balls, because 'ladies of rank always do so,' forsooth, and so she's taken me in hand, to try and polish me up into something like a 'man of fashion,' as she calls those confounded puppies one sees lounging about drawing-rooms. Well, as I didn't like to rile the old woman by refusing to do what she wanted, I went to a French mounseer, to teach me my paces: I've been in training above a month, so I thought I'd come here, just as a sort of trial to see how I could go the pace."

"This is your *début*, in fact," returned I.

"My how much?" was the reply.—"Oh, I see, starting for the maiden stakes, for untried horses only—that sort of thing—eh? Yes, it's the first time I've been regularly entered; I hope I shan't bolt off the course; I feel uncommon shy at starting, I can assure you."

"Oh, you'll do very well when you're once off; your partner will tell you if you are going to make any mistake," replied I.

"My partner; eh? You mean one of those whitewashed young ladies, who is to run in double-harness with me, I suppose?—that's another sell;—I shall be expected to talk to her, and I never know what to say to women; if one don't pay 'em compliments, and do a bit of the sentimental, they set you down as a brute directly. What an ass I was to come here! I wish it was bed-time!"

"Nonsense, man; never be afraid!" exclaimed Freddy, who had just joined us; "I'll pick you out a partner who's used to the thing, and will do all the talking herself, and be glad of the opportunity of giving her tongue a little exercise; and here comes the very girl, of all others,—Di Clapperton." Then turning towards a tall showy-looking girl, who had just arrived, he addressed her with—"Delighted to see you, Miss Clapperton; a ball-room never appears to me properly arranged till it is graced by your presence: here's my friend, the Hon. George Lawless, dying to be introduced to you."

"Pleasure—ar—dancing—with you, eh?" muttered the Hon. George, giving a little quick nod between each word, and getting very red in the face.

The young lady smiled a gracious assent, and saying, "I think they are forming a quadrille,—shall we take our places?"—marched him off in triumph.

"Frank, are you provided, or can I do anything for you?" inquired Coleman.

"Who is that interesting looking girl, with dark hair?" asked I, in return.

"What, the one with the white camelia in her head, leaning on the arm of that old fellow with a cast-iron face?—What a splendid pair of eyes she has got!—I'll find out her name, and get you introduced," replied Coleman, disappearing in the crowd. In a minute or two he returned, and informed me the young lady's name was Saville. "You've not made such a bad hit either," continued he; "they tell me she's to be a great heiress, and old Iron-sides, there, is her guardian. They say, he keeps her shut up so close that nobody can see her; he would hardly let her come to-night, only he's under some business obligations to my governor, and he persuaded him to bring her, in order to give me a chance, I suppose."

"What an expression of sadness there is in those deep blue eyes of her's; I am afraid she is not happy, poor thing!" said I, half thinking aloud.

"Why, you're getting quite romantic about it!" returned Coleman; "for my part, I think she looks rather jolly than otherwise;—see how she is laughing with my cousin Lucy; by Jove, how her face lights up when she smiles!—she's decidedly pretty. Well, will you be introduced?—they are going to waltz."

I signified my assent, and Coleman set off in search of his father, to perform the ceremony, not having courage enough himself to face "old Stiff-back," as he irreverently termed the young lady's guardian.

"I am sorry to refuse your young friend, Mr. Coleman," was the reply to my introduction; "but Miss Saville never waltzes."

"Come, don't be crabbed, Vernon; young people ought to enjoy themselves; recollect, we were young ourselves once!"

"If old Time had dealt as leniently by me, as he seems to have done by you, Coleman, I should consider myself young yet," replied Mr. Vernon; "I believe I have spoken my ward's wishes upon this point; but, if it would be more satisfactory to your friend to hear her decision from her own lips, I can have no objection.—Clara, my dear, this gentleman, Mr. Fairleigh, does you the honour of wishing to waltz with you."

Thus accosted, Miss Saville raised her eyes to my face for a moment, and instantly casting them down again, coloured slightly, as she replied—"If Mr. Fairleigh will excuse me, I had rather not waltz."

I could, of course, only bow in acquiescence, and was turning away, when old Mr. Coleman stopped me with—"There, wait a minute, Mr. Fairleigh; my little niece, Lucy Markham, will be only too glad to console you for your disappointment; she's never so happy as when she's waltzing."

"If you are impertinent, uncle, I'll make you waltz with me till you're quite tired, by way of punishment!" replied his niece, as she accepted my proffered arm.

During a pause in the waltz, I referred to the refusal just received, and asked my partner (a lively little brunette, with very white teeth, and a bewitching smile) whether her friend Miss Saville were not somewhat of a prude?

"Poor dear Clara—a prude?—oh no!" was the reply. "You mean because she would not waltz, I suppose?"

I bowed my head in assent, and she continued:

"I gave you credit for more penetration, Mr. Fairleigh; did you not see it was all that horrible Mr. Vernon, her guardian—he chose her not to waltz; and she is too much afraid of him to dare to do anything he does not approve;—he would hardly let her come here to-night, only uncle Coleman worried him into it."

"She is exceedingly pretty," remarked I; "there is something peculiar in the expression of those beautiful blue eyes, which particularly pleases me; an earnest trustful look, which—you will laugh at what I am going to say—which I have never seen before, except in the eyes of a dog!"

"Oh! I know so well what you mean," replied my partner, "I have observed it often, but I never should have known how to express it. What a good idea!"

"May I ask whether you are very intimate with her? Is she an old friend of your's?"

"No, I never saw her till my uncle took this house; but Mr. Vernon sometimes brings her with him when he drives over on business, and she comes and sits with me, while they are puzzling over their parchments. I like her so much, she seems as agreeable, and good, as she is pretty."

"How is it," asked I, "that my friend Freddy did not know her by sight, even?—he had to inquire her name this evening."

"Why, Frederick is generally obliged to be in town, you know; and I have observed that, when he is down here, Mr. Vernon never brings her with him."

"He had better make a nun of her at once," said I.

"Perhaps she won't be a nun!" said, or rather sang Lucy. And here we joined the waltzers again, and the conversation ended.

THE PARIA.

It is not our intention in this article to discourse on the impure castes of the Hindoos, with whose unfortunate condition every one is acquainted: we have merely adopted the term "Paria," as descriptive of a class of persons common in society, who, because over-looked or despised by others, may fitly receive from us a few words of sympathy. We find it exceedingly difficult to express our meaning by a definition. We refer to those individuals, frequently met with, who, suffering under some disgrace of nature or fortune, seem to stand isolated in the midst of their fellows, to have no independent place in society, but to live only as accessories to the happiness of others. But what we mean will probably become more apparent in the sequel.

Some naturalists, with a devotion to science which calls for the admiration of all, have spent weeks, months, and even years, in watching the habits of certain animals, of whom it happens that the most insignificant are just those whose natural history it is the most difficult to fix. So is it with the Paria. The difficulty of gaining explicit information as to the habits of this part of our race, can only be known by the very few who have interested themselves in obtaining it.

For our own part, we confess that a peculiar turn of mind has induced us, more than others, to notice individuals of this class. With the great, the rich, and the prosperous, we have only a moderate degree of sympathy. We delight to be conducted through the rooms of some princely mansion, and deep is the gratification which our taste derives from the works of art which they contain; but our heart is far more strongly touched, when in some humble cottage we discover a domestic group gathered round their tea-table, the parents sitting composedly at each end, and the children mounted on high chairs at their side. We read, without any great emotion, the description

which our newspaper gives us of the dresses worn at some fashionable ball, but we gaze with deep interest on the scanty and patched wardrobe of some poor family, which, for the purpose of being dried, the careful mother has hung on the bushes, or spread on the beach; nay, we have occasionally, with our own literary hands, picked up and replaced some stray garment which the wind had carried away: and, when we have been in the office of some thriving man of business, our attention has wandered from the lordly sentences of the principal, or the lively prattle of the gentleman clerk, who, arrayed in gold chains and rings, was edifying us with his profound observations on the weather, to rest upon some pale-faced underling, stooping over a desk in a gloomy corner. This infirmity of ours we the less scruple to confess, because we think it is harmless, and has sometimes been useful to others, if not to ourselves. But to return.

The first circumstance, then, that we shall adduce as distinguishing the Paria, is the mysteriousness of his habits and employments, the difficulty of tracing how he lives and what he does, what are his opinions, and what are his enjoyments. Though a Paria, male or female, may be found in almost every large family, you may often pay many visits to a house which contains one before becoming aware of his or her existence. On grand occasions, or on general gatherings of kindred, the Paria comes forth from his concealment, passes behind the others like a shadow, or lingers unnoticed, like a piece of furniture, in their midst, and then returns to his accustomed hiding-place.

You call on a friend to congratulate him on the birth of a child: you (perhaps prudently,) have delayed your visit till the nurse has been dismissed: and you find the child in the custody of a respectable female whom you have not before seen. The parents, occupied with themselves and their infant, and quite absorbed in the interesting event, which, in their opinion, is all-important, can scarcely be got to tell you who the stranger is. "What! that lady!" the wife at length exclaims, "that is my sister. I thought you had seen her before." On a closer inspection you discover a likeness, but the features wear an expression of resignation and mildness, strikingly contrasting with the complacent self-satisfied aspect of the married dame. You enter into conversation with her, and on general topics she is well-informed and communicative, but as to herself you can obtain little intelligence. In what obscure retreat she had hitherto lived you cannot exactly learn; but in the course of conversation she mentions a Mrs. A., to whom she was paying a visit, when the birth of her sister's child drew her, as by a kind of magnetic attraction, to the spot where you found her.

In further illustration, we give the following conversation with the brother of a Paria. "But pray, Mr. Smith, how is your brother?" "Oh, he is very well." "Where is he now?" "He lives with us." "What does he employ himself about?" "He assists us a little." "But he must have much vacant time, what can he do with himself?" "I really don't know." "Is he not very lonely and unhappy?" "I really don't know." "Has he any associates?" "I don't know, indeed." And so the inquirer is obliged to give over his interrogation, and the history of the Paria remains as great a secret as before.

Sometimes, too, when enjoying a season of relaxation at country lodgings, you often hear a strange step on the stairs, and are wished "good morning" by a civil-looking gentleman who meets you at the door. You, at length, inquire of the servant who the unknown person is, and you are told that "it is Mr. B., a single gentleman who has lived for many years in a room upstairs." The only further information that you can elicit is that "he is a very nice sort of man."

Another, and indeed the principal, thing which distinguishes the Paria, is that he is no favourite of nature or fortune. There is nothing, generally speaking, for which the world punishes an individual so severely as for those infirmities which he cannot possibly help. A man may become the talk of the neighbourhood for his irregularities, or crush his dependents by his covetousness and tyranny, but he will be still received in society with smiles, and find many eager candidates for his favour. But let him be the subject of some natural defect; let his nose be awry or his legs uneven, let him falter in his speech or have a hump on his back, or let his nerves have been shattered, (in labouring, it may be, for the welfare of his fellows,) so that he has become diffident and easily embarrassed, and we shall see the fairest lips distorted by a curl of contempt at his approach; and, where the infirmity is apparent, the very children in the street will jeer at him as he goes by. Hazlitt candidly declared that he *hated* sick people: and by whom is not poverty considered as a crime? Under some heavy calamity of this kind, then, the Paria has to bow; and often, with a heart overcharged with love to all, he has to bear the open insult or ill-suppressed derision of those whom he would put forth his utmost strength to serve.

It is also a remarkable feature of the Paria's character, that, though, while able, he toils as much as his neighbours, it is with this difference, that he seldom labours for his own benefit. The Paria nurses or educates the children of others: he helps to build his neighbour's fortunes: and his very calamities turn out, in some way or other, to advance the welfare of other people.

It must be observed, too, that the Paria is unmarried. The necessary consequence of the marriage of a Paria is the loss of caste. Even the union of two Parias is sufficient to deprive both of their distinctive character. "A single life," says Dr. Johnson, "has no comforts:" this, then, must be the life of the Paria. If into his cup of humiliation the pearl of marriage be melted, its bitterest ingredient, solitariness, will be neutralized: and whatever else he may become, he is no longer a Paria, for he is no longer alone.

The Paria is distinguished by a peculiar fondness for the animal creation. If he can afford it, he has pets of his own; if not, he forms friendships with those of other people, or with wild animals. Like Sterne's negro girl, he flaps away the flies, but does not kill them: and sometimes, when in his walks he meets with a roaming snail, which, instead of stopping in some safe corner, will persist in carrying its spiral castle into the very middle of the path, and in directing its minute telescopes at the toes of the passer-by, he snatches it up, as a mother would a child in danger of being run over, and puts it out of harm's way.

The Paria occasionally writes poetry, the most characteristic portions of which the world would

declare to be maudlin. Should his poems when printed find no purchasers, the Paria comforts himself with the thought that some specimens may be preserved in the inside of trunks; and that, perhaps, some disconsolate schoolboy, opening his box on the first day at a new school, or some solitary traveller, unpacking his little wardrobe in a distant land, may read some of his verses, and be encouraged by the voice of a companion in sorrow.

The ways of becoming a Paria are various. Sometimes, the individual is born under some hereditary reproach, which makes him a Paria from his very birth; sometimes he is made so by some natural infirmity; sometimes a whole family are made Parias for a time by the second marriage of their parent; and sometimes continued ill-health introduces a person to this society. In the latter case, it is curious to observe how gradually the change is brought about. A man occupying a tolerably prominent station in life, is seized with a sudden illness. At first, his friends are frequent and anxious in their inquiries: instead of having lost ground in their affection by his malady, he appears to have gained; for he is become an object of far greater solicitude than before. But his illness continues. To go on inquiring after a person's health for months, and even for years, seems to them absurd: the very lapse of time they think must have cured him; or, at all events, he ought to have died after a decent interval. The inquiries accordingly become less and less numerous, and at last cease altogether: his sympathizing friends are certain that he has got well, and wondering that he should still persist in leading an idle life, soon forget him amid their own pressing engagements. He has become a Paria.

The most gloomy moments of the Paria are those, when he looks around on others who commenced life at the same time with himself, and compares their prosperity with his own misfortunes. The waves of life have borne the vessels of their fortunes on to fame, wealth, or comfort, while his bark remains stranded on the shore. A celebrated writer, who, for a short while, fancied himself in danger of becoming a Paria, has expressed these sentiments in his Memoirs. "While so many of my acquaintance," says Gibbon, "were married, or in parliament, or advancing with a rapid step in the various roads of honour and fortune, I stood alone, immovable and insignificant." Hope, however, soon springs up in the bosom of the Paria who has well learnt his lesson in the school of affliction, that he may yet add his little aid to the advancement of the general happiness, and be permitted to bless, though he be, for a time, forbidden to enjoy.

Yet the Paria, despised though he may be, has peculiar claims on the respect and even applause of the philosophic mind. After having shared with the world the admiration excited by some act of daring heroism, or by a long series of successful exploits which coronets and wealth have rewarded; after having gazed wonderingly on the orator on whose lips a multitude has hung in breathless rapture; after having read of the hair-breadth escapes and bold enterprises of some persevering traveller whose steps thousands, in imagination, follow, we would also think of the lowly individual,

"Whose virtues walk their narrow round,
Nor make a pause, nor leave a void,"

and who yet never hears the voice of praise, and

receives but a meagre recompense; or of the victim of sickness, suffering in his chamber a lengthened agony, compared with which the toilsome campaign and the hardships of travel are light things. Yes, to success and greatness worship is eagerly paid; but how few are there who recognise the august majesty of patient endurance.

O Sorrow! how do we shrink from the touch of thy skeleton fingers, and yet, perhaps, it is to some pleasant resting-place that thou art desirous of leading us. Thou hast the key of the soul's most generous emotions: thou holdest the magic mirror in which we see our moral features the most clearly reflected: thou afforest a bond of union whereby hearts are knit together almost as closely as by love's golden fetters. Often art thou like the ocean-gale, beating roughly on the brow, and roaring in the ears of the wanderer, and yet carrying health and vigour into every nerve of his frame. The mysterious secrets of human nature, the knowledge of others and of ourselves, the true appreciation of earth's cares and pleasures; these are thy lessons: humility, tender-heartedness, resignation, self-denial, and a readiness to forgive; these are thy proper fruits: a lively sympathy with the meanest thing that breathes, an all-embracing charity, and the hope of a final refuge in a better world; these are thy rewards!

M. N.

OLD RECORDS OF NEW ROADS.

No. III.

WIMBLEDON station is only five miles and three quarters from London by the railway, though nearly double that distance by the old road. To the right lies Wimbledon park, worthy on every account to be the observed of all observers, for there formerly stood "that goodly house so beautiful for building, and so delectable for fair prospect, and which Sir Thomas Cecil, Knight, sonne to that most prudent Councillor of State, Lord Burleigh, built in the year 1588, when the Spanish Armada made saile upon the coast of England."

The splendour of this ancient manor-house is minutely recorded in the tenth volume of the *Archæologia*, and, from the curious engravings which accompany the description of it, it certainly appears to have well deserved the praise of Fuller, who calls it "a daring structure, equal if not superior to Nonsuch." It stood on a rising ground, and the ascent to the hall door was made by a succession of five courts or terraces, one above the other, to which seventy steps gave entrance, they being distributed in a very graceful manner. Some of those "stoppes" and all the balustrades were of freestone. But the pavement was of Flanders bricks, "the angles, window stanchives, and jammes were of ashled stone." But all the rest of the house was of "excellent brick," a material then more prized in England than stone, as the use of it only became general at the death of James I., at which time London was almost entirely built of wood.

The interior of this mansion was still more costly; one gallery on the ground floor, 108 feet long, was "pillored and arched" with grey stone or marble. The wainscot was varnished with green, and "spotted with starres of gold;" and "benched all along." But the ornament of this gallery which would seem most strange now, was a grotto in the middle of it, "wrought in the arch and sides thereof with sundry sorts of shells of great lustre, and ornaments;" also "fortie sights of seeing glass sett together in one frame, much adorning and setting forth the splendour of the roomes."

In the hall the ceiling was of "fret or fancy work," ornamented with paintings; and the floors were of black and white marble. In this room was also "a fayre and rich paire of organs." Other parts of the house contained pictures, described as "landscapes of battayles, anticks, heaven and hell, and other curious works." One complete room, called the "Den of Lyons," was painted all round with lions and leopards. Other apartments were designated as "The King's Chamber," "The Queen's Chamber," "The Duchesse's Chamber," "The Countess of Denbigh's Chamber," "Lord Willoughby's Chamber," "The Summer Chamber," &c., but in the whole house I find but one chimney-piece mentioned, which stood in the middle of a gallery on the second floor, and was "very fayre and large, of black and whyte marble, engraved with coates of armes, adorned with severall curious and well-guilded statues of alabaster, with a foot-pace of black and whyte marble." This gallery was 109 feet long, floored with cedar-boards "casting a pleasant anell." The walls of another gallery were ornamented with several "compendious sentences," and another room was "particularly admired for a tytle window to looke into the greate kitchen." Why this particular prospect should have been thus preferred, seems the more strange, as there were several gardens, consisting of "Mazes," "Wildernesses," "Knots," "Allies," &c. There was a fine orangerie, and, "furthermore, a way cut out of the parke, planted on each side thereof with elms and other trees, in a very decent order, extending itself in a direct line, from thence quite through the park, northward, into Putney Common, being a very special ornament to the whole house."

And a strange witchery it was which seems to have cast a spell over that old manor house, making its history an epigram of that of its successive owners. Brief as brilliant, its splendour essentially contributed to the renown of the times in which it shone, whilst its short-lived glories terminated, like the titles of its possessors, by passing into families aliens to the first founders of its honour.

The first remarkable person who was owner of Wimbledon, was Thomas Cranmer, and as both rose from comparatively small beginnings, so both perished by fire. For, after the obscure student of Cambridge, who, from solicitude about his health, used to change his position and his room every half-hour—after this man had risen to the highest pinnacle of fortune, and, as archbishop and ambassador, had not only performed the marriage ceremony of one king, and the coronation of another, but had likewise, during the minority of Edward VI., acted as co-regent of the kingdom—this man, who, at different times, showed the greatest weakness, and the greatest fortitude, finally perished at the stake.

Before, however, Cranmer had reached the apex of his fortune, he exchanged, for other lands, "the Grange or Farm of Wimbledon, with the Manor of Mortlake," with Henry VIII., who granted it to Thomas, Lord Cromwell, Earl of Essex, whom Camden emphatically calls "one of the floating stocks of fortune." After his attainder, it was settled on Queen Catherine Parr for her life; Queen Mary gave it to Cardinal Pole; and Queen Elizabeth bestowed it, first on Sir Christopher Hatton, and afterwards on Sir Thomas Cecil, Earl of Exeter, in exchange for an estate in Lincolnshire.

He left Wimbledon to his third son, Sir Edward Cecil, created Viscount Wimbledon and Baron Putney, and on his death his heirs sold it again to the Crown, and Charles I., settled it as (in part) dowry on his queen Henrietta Maria.

Meantime the splendid Manor-House of Wimbledon had experienced similar fortunes to those of its various owners, or rather its fate seemed ominous of theirs—for it chanced that, in the very year when the doomed Charles, intoxicated with recent power, threw the torch of discord over the land, and, under the councils of Buckingham, fanned rebellion into a flame,—

(1628)—in that very year, the last of Buckingham's meteoric life, nearly the whole of the mansion was burnt to the ground, by the accidental blowing up of some gunpowder mills in the neighbourhood. Yet it was soon rebuilt by its then owner, Viscount Wimbledon, with increased splendour, for we are told that on its renovation the outside was painted in fresco by Sir Thomas Cheyne, and, when it passed from his heirs to the possession of Charles, it was included in the inventory of his "jewels and pictures."

Such being the case, it is scarcely matter of surprise that this princely residence should have attracted the cupidity of that government which professed to be established on the ruins of the aristocracy. It was minutely surveyed and valued, by Commissions (1649) appointed by Parliament, and the result of this tyrannical infringement on private property by republican usurpers was, that the manor and its gorgeous palace was bestowed on the regicide, General Lambert.

This occurred in the same year that Charles was beheaded. That unfortunate monarch, blind to his impending fate, only a few days before his trial, ordered the seeds of some Spanish melons to be sown "in his garden of Wimbledon." That royal garden, fated so soon to pass into the hands of his bitterest foe!—and is it not a strange coincidence that Lambert (according to Coke,) "after he had been discarded by Cromwell betook himself to Wimbledon-House, where he turned florist, and had the finest tulips that could be had for love or money?"

But the rede of Wimbledon was not yet read. It had been the appanage of queens, and at the return of Charles II. it was restored to his consort. But, as the crown of England was fated to rest on many heads of different families, so did this manor pass to many successive owners. At last it was purchased by Sarah, Duchess of Marlborough, who gave it to her grandson, John Spencer, Esq., ancestor to the present Earl Spencer. Again the palace was burnt down to the ground, but its splendour was never to be renewed. The ruins were cleared, and the ground levelled, so as not to leave a trace of its foundation; whilst such of the offices as remained were converted into a portion of the present mansion. It is worthy of remark that Wimbledon-House in Southwark was also burnt down and never rebuilt.

Mr. Lysons asserts, that the first—justly called the great—Lord Burleigh, had a grant of lands at Wimbledon, the patent for which was dated so early as the reign of Edward VI.; and that on these lands "stood a mansion, in which he frequently resided, for some of his letters, as Sir William Cecil, Secretary of State, are dated from Wimbledon (1599); and, as Lord Burleigh, he entertained Queen Elizabeth at his house of Wimbledon for three days."

It is certainly presumptuous in me to differ from such an authority as Mr. Lysons. But the letter, written by Lord Burleigh himself, in vindication of the charge of extravagance, made by his political enemies, and more especially that of his numerous houses, affords at least negative proof that Wimbledon was not one of them, as in it that house is not mentioned. In this letter—speaking first of Theobalds—he says, "which was begun by me with a mean measure, but increased by reason of her Majesty's often coming, whom to please I never would omit to strain myself to more charges than is that of my building; and yet, without some special directions of her Majesty, upon fault found with the small measure of her chamber, which was in good measure for me, I was forced to enlarge a room for a larger chamber, which need not be envied of any for riches in it, more than the show of old oaks, and such trees, with painted leaves of fruit. For my house in Westminster, I think it so old as it should not stir any, many having of later times built larger by far, both in city and country. My house of Burghley is of my mother's inheritance, who liveth, and is the owner

thereof; and for the building these I have set my walls on the old foundation. Indeed, I have made the rough stone walls to be of square; and yet one side remaineth as my father left it."

The only other residence which it is ascertained that Lord Burleigh possessed, were his "lodgings at Court," probably an office appended to his employments there; but in all, the arrangements of his household were equally regular and magnificent. In his house in the Strand (or, as he calls it, Westminster) he had eighty people in his family, exclusive of those who attended him at Court, and there his expenses were 30*l.* a week in his absence, and between 40*l.* and 50*l.* when there himself. At Theobalds his expense was the same; but there he allotted 10*l.* a week for the employment of the poor in his gardens, and the expenses of his stables were a thousand marks a year. He kept a standing table for gentlemen, and two others for persons of meaner condition, which were always served alike, whether he were in town or country. About his person he had people of distinction, inasmuch that he could reckon twenty gentlemen retainers, who had each 1,000*l.* a-year, and as many amongst his ordinary servants who were worth from 1,000*l.* to 20,000*l.* a piece. His charities were on a not less munificent scale, and in these he was fully seconded by his amiable wife. She was a daughter of Sir Anthony Cook, and proved the faithful companion of her husband in all his fortunes, from their first rise in the reign of Henry VIII., till their completion in that of Elizabeth. Nor was her learning—especially in Greek—less than her benevolence;—four times in every year she relieved all the poor prisoners for debt in London. She maintained for many years two scholars at St. John's College, Cambridge, and before her death perpetuated this charity by a grant of lands. She likewise gave to the Company of Haberdashers, in London, a sum to enable them to lend to six poor men 20*l.* a piece, and a similar charity of 20 marks to six poor people at Waltham and Cheshunt in Hertfordshire, besides other acts of kindness, that fully entitle her to the praises so lavishly bestowed on her memory by different writers.

Nor was Lord Burleigh's private character less estimable, however his public conduct may have subjected him to reproach. Certain it is that his loyalty and devotion to Elizabeth were unbounded, and her esteem for him was equally so. Whether Wimbledon manor-house was the scene of any of her Majesty's visits or not, it is certain that she frequently conferred that distinguished honour on Lord Burleigh, remaining four or five weeks at a time, at a cost to her loving subject that averaged between 2,000*l.* and 3,000*l.* each visit; and these visits were repeated twelve times.

Of these royal feasts it is scarcely possible to form any idea at the present day, as neither the style of the entertainment, nor the *etiquette* on these grand occasions, can easily be paralleled in modern times, for no one spoke to her Majesty without kneeling, and wherever she turned her eyes, every one fell on their knees. Her table was covered and served by noblemen, who neither approached, nor retired from it, without kneeling, and two of her ladies tasted every dish before presenting them to her, and then carried them to her, and offered them on their knees to her Majesty, where she sat apart on a dais, or throne.

In those days the Court, and upper classes, dined at noon, and supped at five or six o'clock in the evening. Silver plate was then both general and profuse—that left by Lord Burleigh, at his death, was valued at 42,000*l.* sterling; whilst, on the other hand, the use of knives was so little understood, that they were suspended from ladies' girdles with their purses, as ornaments of dress, in the beginning of the 16th century, and first used at table towards the end of Elizabeth's reign. Potatoes were not used till the second year of her successor, and forks were first brought from Italy in the seventh year of James (1610), though not generally

adopted till a considerable time afterwards. Our modern diners-out would not willingly dispense with any of these luxuries.

The quantities of meat, and other viands, provided, during these visits of Elizabeth, for her Majesty's use, almost surpass belief. But some idea of the extravagant expenditure may be formed from the supplies for her household, provided by the laws of purveyance, which imposed such intolerable burthens on the different counties of England, that at last she made a compromise, or agreement, with her subjects, settling the proportion each county should "yearly serve," in oxen, calves, &c. The amount for only one parish in Middlesex was thus rated:—"200 quarters wheat, 140 veals, 20 dozen geese, 10 dozen coarse capons, 20 dozen hens, 20 dozen pullets, 40 dozen chickens, 202 loads of hay, 180 loads of litter, 211 quarters and 2 bushels oats, and 200 loads of wood." The expenses of her Majesty's household amounted, at the end of her reign, to the sum of 55,000*l.* annually.

But feasting and good cheer were not the only amusements provided for the royal guest on these expensive visits to her subjects. It was customary to present the most costly gifts to Elizabeth, as well as to provide the different amusements in which she delighted. Her taste for theatrical exhibitions was such, that at Windsor Castle she had a private stage erected for the performance of plays, chiefly those of the immortal Shakspeare; and it is scarcely probable that similar entertainments should not have been equally at her command elsewhere. Chess was also in vogue at Court; and Shakspeare introduces that game in the *Tempest*. Elizabeth also made a present of a gold chess-queen to one of her courtiers. She was fond of music, and played on the virginals, but dancing appears to have been her favourite diversion, and Sir Christopher Hatton (Lord Burleigh's predecessor) owed much of her favour to his skill in that accomplishment, which gained for him the appellation of the Dancing Chancellor.

There is a curious picture still extant, representing "Lord Burleigh" playing at cards with three other persons, apparently of distinction, each having two rings on the same fingers of both their hands. The cards are marked, as at present, but are longer and narrower than modern cards. Eight of these lie on the table, with the blank sides uppermost, whilst four remain in the hand of each player, and heaps of gold and silver coin lie on the table. This picture originally belonged to the great and good Lord Falkland, and was painted by Zuccaro, who also took a likeness of Elizabeth. As the first Lord Burleigh is said to have entirely devoted his time to business and study, taking no diversion but that afforded by his gardens, of which he was both fond and proud, it is to be supposed that this painting was not his portrait, though mistaken for his, as was the ownership of the old manor-house of Wimbledon.

And there lies Wimbledon Common! how well do I remember, when a child, looking with awe and wonder at the working of the first huge shapeless telegraph erected there. And there, too, stood the gibbet, on which hung in chains the skeleton of the noted highwayman Abershawe—a spectacle more appalling to the innocence of childhood, than to the scared consciences of his own fraternity; for, at the period I allude to (some fifty years ago), highway robberies were so common in that neighbourhood, that I unconsciously witnessed, from a drawing-room window, one committed on Lord Onslow, whose carriage was stopped at 11 o'clock in the day by two highwaymen on horseback, in sight of the house I was in, and within call of several labourers who were at work in an adjoining field, and who, like me, believed it impossible to be a robbery at such an hour, and thought, as I did, that the young man in the red jacket, who was at the window of the chariot, was the postboy with Lord Onslow's letters. The highwaymen owed their safety to their hardihood,

and with good generalship effected their retreat, from the apparent impossibility of the undertaking.

But such little incidental excitements are now, and for ever, at an end. Macheath himself would scarcely step a carriage on the Company's railway; and, even if the veriest adept in the trade calculated on turning to his own advantage the celerity of the conveyance as a means of escape, one silent whisper passed by that immovable, almost invisible, telegraph that is suspended by the rail side, might anticipate the flight and prepare an unexpected greeting for his arrival. Picture to yourself the awe-struck murderer, who not long ago, at the end of many miles, found himself met by the details of a crime committed within the hour! The stings of conscience are not swifter than the detection which this invisible agency then produced—and, if the rapidity of the noisy mechanism of steam carriages is surprising, the motionless but instantaneous communication of the electric telegraph partakes of the sublime. This voice without sound—this mute hue and cry, is

"Wonderful! wonderful! wonderful! past all whooping!"

I can, however, see nothing now of Wimbledon common. Where is the mound of dead men's bones that once marked the site of a battle fought during the Saxon Heptarchy, in 568? And where is the well that once supplied the village of Wimbledon, and which was never known to freeze? And the fire-house on the edge of Putney-heath, (albeit in the manor of Wimbledon,) of which so many marvellous stories amused my infancy? Of this iron house the true history is, that it was built in 1776, by David Hartley, Esq., for the purpose of proving the efficacy of his invention for preserving houses from fire. The experiments were successful, and repeated several times in the reign of George III. before their majesties, the lord mayor and aldermen, and many other persons of distinction. Many of the spectators remained in perfect confidence and security in the room over that in which the fire was burning with great rapidity. An obelisk recording this invention was erected near the spot, on the anniversary of the great fire of London, Nov. 22, 1776.

But neither the little ugly iron house nor the obelisk are now to be seen—at least, by the flights of railway passengers. Houses and pleasure grounds alone are visible, and what was Wimbledon common is now studded with suburban villas and "genteel summer residences particularly adapted for small families," and especially contrasting the extensive locality of the Old Manor House.

But if the profuse expenditure of our ancestors on their mansions and establishments is now only to be found in the records of the antiquarian, we must not from thence conclude that the actual wealth of England at any time equalled what it amounts to at present, however the channel through which it flows may differ from the current of their days. A gentleman of a thousand pounds a year would not now consent to be the retainer even of a Lord Burleigh. But in one of the many houses which might be erected out of the materials of one old one, he probably would himself form the nucleus of another circle—perhaps become the founder of a future aristocracy. Nor are riches now confined, as formerly, to the sole possession of lands or tenements. From documents recently laid before Parliament, it appears that the personal property of this kingdom has increased during the last ten years at an average of forty-five millions sterling per annum; and a fact coeval with this enormous accession of wealth, if not in a great degree accounting for it, is in further evidence before the House of Commons, namely, that during the last twelve years sixty millions sterling have been invested in railways: whilst the impetus which must inevitably be given to all branches of trade and agriculture by the extraordinary circulation of money within Great Britain which these railways produce, may in some measure be calculated from the fact (taken at random from the rail-

way reports,) that on one alone of the many now in operation, viz. the Eastern Counties, for the week ending the 11th of October, 1844, the receipts amounted to 9363*l.* 12*s.*, and the number of passengers to 65,078.

In addition to the advantages of a free circulation of money, which must be felt by all the mercantile classes, another benefit arising from railways is the increased demand for labour which they occasion throughout Great Britain and Ireland. In the latter portion of the Empire, employment for the labouring poor—a circulation of specie and facility of communication from one part of the country to another—will, in all human probability, prove more effectual in the removal of that weight of poverty, and its consequences crime and disease, than any political measure that has ever been suggested for the amelioration of the Irish peasantry. Nor is it to be forgotten, that in proportion to the extent in which the use of machinery is made to supersede that of horses, so will be the quantity of land withdrawn from their support, and made applicable to the cultivation of food for man. In fine, the subject of railways affords occasion for reflection to all classes, from the politician to the mechanic; from the busiest merchant to the idlest traveller. Shakspeare, "fancy's child," in some of his wildest reveries, having "exhausted worlds and then imagined new," devised for one of his bewitching fairies, the task of placing a girdle round the earth in fifteen minutes. This dream of poetry may now be compared with the sober deductions of philosophy; and Dr. Lardner or Mr. Babbage's calculating machine alone, can prove—not what may be done, but what will be found impossible, when electricity, and magnetism, and steam, and locomotion are brought, by human skill and industry, to the highest perfection of which they are capable. At present, the Reports laid before Parliament prove that the rate of express trains varies from thirty-four to forty-eight miles an hour! Bishop Wilkins, in the days when the Royal Society first dawned, wrote an essay on How a man may fly to the Moon, in which he says—"If it be here inquired what means there may be conjectured for our ascending beyond the sphere of the earth's magnetical vigour, I answer: First, it is not perhaps impossible that a man may be able to fly with wings," &c. The worthy prelate should have consulted his contemporary, Lord Worcester, on steam,—and then the shroud of Aneas and Achaes might have been applied to their deeds, instead of to their speculations.

"A veil of thickened air around them cast,

That none might know—or see them as they pass'd."

But setting aside these and all similar visions, past and to come, it has been officially announced that the actual receipt of monthly traffic on the South Western Railway, from July to December, 1845, amounted to 201,522*l.*, and the amount derived for passengers during the same period to 183,072*l.* In this instance, truth is more wonderful than fiction.

VISIT TO THE SCHOOL FOR THE INDIGENT BLIND, ST. GEORGE'S FIELDS.

ONE of the most striking instances of advancement in what may be termed the *moral topography* of the metropolis is to be found in the past and present occupancy of the district, known to this day as Saint George's Fields, although they have long ceased to be *in rare*. In ages long past, they formed the centre of several Roman roads; and it was an important station of that great people, as is sufficiently attested by the discovery of coins, bricks, tessellated pavements, and other proofs of Roman civilisation. It is curious, however, to note, that

notwithstanding these indications of the early importance of St. George's Fields, it must have been a strangely neglected district; for, within the memory of persons living, it was probably one of the most Alsatian suburbs of the metropolis; where idleness and improvidence ran their short-lived round, and vice and crime succeeded, with their legion of misery and ruin. The place had, indeed, about it a sort of moral pestilence, corresponding with the natural swamp of the site. It was then the scene of low dissipation and debauchery; of Sabbath profanation, and knavery, and wickedness in their most odious forms. The reader will, doubtless, recollect it, in record at least, as the focus of "the Riots" of 1780; a fact sufficiently indicative of the bad character of the locality in the latter portion of the last century.

From generalities, however, let us descend to particulars. A considerable plot of ground was, at the above period, occupied as "the Dog and Duck" gardens, the resort of characters of the worst description, and thus stigmatized in one or more of the excellent Hannah More's tracts; "the Cheapside Apprentice," if we remember rightly. Upon this very site, at the present day, stand four palaces of philanthropy; four of the noblest institutions of which this country can boast; the Philanthropic Society, for the Reform of the Children of Vice; the Royal Hospital of Bethlehem, and the House of Occupation of Bridewell, and the School for the Indigent Blind. The philanthropist, as he surveys these "happy homes and havens," may reflect upon the vast amount of good which these institutions must have effected for the welfare of the metropolis and the country; and, in the boundary wall of Bethlehem, he may see the identity of the locality, a stone, sculptured with a dog and duck, the sign of the notorious gardens.

The infamy of the Dog and Duck gardens grew to so frightful a pitch, that they were, at length, closed by order of the magistracy, and the premises vacated. They were, however, shortly afterwards appropriated to a much better purpose. In the year 1799, the house was opened as a "School for the Indigent Blind," by a generous band of four gentlemen, Messrs. Ware, Bosunquet, Boddington, and Houlston. Its provision for some time after its establishment was for only fifteen blind persons. We remember the infant establishment in one of the tavern buildings: it did not, for a time, excite any extraordinary interest; for the public had not then fully acknowledged the truth of the benevolent Dr. Lettson's observation: "he who enables a blind person, without excess of labour, to earn his own livelihood, does him more real service than if he had pensioned him to a greater amount."

The institution, however, soon attracted the notice of philanthropists; and up to the close of 1805, had bequeathed to its fund legacies amounting to 500*l.*; and from this period, the stream of benevolence appeared to set in towards the objects of the establishment, in bequests of various amounts, ranging from 5*l.* to 10,000*l.*

At length, the site of the School was required by the City of London for the building of Bethlehem Hospital, the old structure in Moorfields being condemned for removal. A site of two acres was then allotted to the School, opposite the Obelisk, at the junction of the Surrey roads, and between the point formed by the meeting of the London and St. George's roads. The frontage was a plain eleva-

tion, with a bee-hive in its fascia, emblematic of the industrial education of the school. In 1826, the directors and friends of the institution were incorporated, under the title of "the President, Vice-President, Treasurer, and Members of the School for the Indigent Blind;" the object of the establishment being "the reception, maintenance, and employment of blind persons in indigent circumstances;" the qualification of members being, a donation of ten guineas, or an annual subscription of one guinea; a larger amount entitling to a proportionately larger number of votes for the admission of candidates to the School. This act of incorporation gave fresh impetus to public sympathy; for, in the two years following, the bequests were numerous, and included three legacies of 500*l.* each, and one of 10,000*l.*, the latter by a "good Samaritan," James Tillard, Esq., through whose munificence are retained certain of the scholars who would otherwise be placed in a state of want and destitution. To commemorate such generosity, the persons so benefited are designated "Tillard's class."

The object of the institution, we may here explain, is the twofold education of the blind; "the imparting to them that religious knowledge, which shall set before them their duty to God and man, and render them wise unto salvation; and the instructing them in a trade, by which they may be able to provide, either wholly, or in part, for their future subsistence." The excellent result may be thus summed up.—"During a period of forty-five years, 336 persons, exclusive of those who have been placed on the permanent establishment, or died in the institution, as also of those who have been dismissed as incapable, or for misconduct, have been returned to their families, able to earn, according to their several abilities, from 6*s.* to 1*l.* 8*s.* per week. The number of pupils has increased from fifteen males, admitted in 1800, to seventy-five males, and seventy-six females; and a manufactory has been established, where articles made last year, entirely by the hands of the blind persons, were sold for 152*l.* 9*s.* 11*d.*—(*Account of the School,*) 1846.

A short time since, we devoted an afternoon to the inspection of this very interesting establishment; and the facts and impressions of our visit we will endeavour to convey to the reader. Nothing within the range of our own observation, has awakened in our mind a livelier satisfaction at the labours of the philanthropist to alleviate the burthens of suffering nature. We remember the institution from our childhood, and many a time and oft have our tender sympathies been excited by witnessing the sightless beings in their playgrounds; then, indeed, our eyes were "dimmed with childish tears" at what we considered an afflicted condition of almost abject helplessness. Our subsequent visits to the school have, however, dispelled these false impressions, and have convinced us that although blindness must still be considered, comparatively, as "an afflictive mutilation," benevolence has, with her blessed light, so bettered the condition of the sufferers, that they are no longer—

"From the cheerful ways of men
Cut off, and for the book of knowledge fair
Presented with a universal blank."

Evidence of this consolatory fact is open to the public, who are invited to visit the School, and

witness the pupils at work, at stated periods. In thus courting publicity, the Committee of the School have largely contributed to its success; and it will be a delightful "recompense of reward," if the details of our visit be the means of inducement to others to visit the establishment, and there test, by their own observation, the nature and extent of its benefits.

We entered by the handsome iron gate of the eastern wing. In the first room to the right of the gateway were several females, of various ages, seated at a table; some of them knitting, others at needlework, and a few unoccupied. They were uniformly dressed in dark stuff gowns, and printed cotton handkerchiefs over their shoulders. They were quiet, and to all appearance contented; some had the full bloom of health, and replied to questions with much vivacity. Visitors are strictly enjoined not to express their compassion within the pupils' hearing, an injunction we had some difficulty in complying with; for, notwithstanding all that humane ingenuity has devised towards making up for the loss of sight, the first glance at the sufferers can scarcely fail to quicken our sympathies; the blank of the "sightless balls" is painfully affecting, and it is not until you become better acquainted with the *inmost* condition of the blind that you become sensible of their cheerful frame of mind, which fits them for the full enjoyment of society; and we soon acknowledge, with Mr. Alston, that "though labouring under disadvantages, at first appearance insurmountable, we find that the sense of hearing is very acute in blind persons, which enables them, from oral information, to analyse and compare, and arrive at conclusions more or less correct; while their retentive memory and other powers of mind all contribute to their stores of knowledge, so that by these united means, they become well informed on subjects of general interest."

The correctness of these inferences was strikingly evident upon our entering a large work-room upon the ground floor, where females were employed in knitting stockings, and needlework; in spinning, in making household linen, and body-linen, for the pupils; in netting bags and reticules of silk, &c., and in fine basket-making; most of these employments involving retentiveness of memory and uniformity of operation, apparently incompatible with a state of blindness. There is a machine adapted to the use of blind persons, for making sash-lines, clock and clothe's-lines, of a peculiar construction, which have been patented; the sash-lines, especially, have been approved of by builders of the first eminence. It is important to notice these points, lest it should be imagined that the manufactured articles are clumsily made; whereas they are in many respects superior to goods of their class. At one end of the room is a glazed case, in which are a variety of fancy baskets, baby-hoods, bags, purses, watch-pockets, and other articles of tasteful design, both as regards colour and make; in short, such as are contributed by the ladies to "charity bazaars," and are among the labours of the drawing-room. These elegancies are offered for sale to visitors, at very moderate prices.

The women and girls are ranged on each side of the long room, and as we walked down the apartment, the busy hum of their industry gave a cheerful air to the scene. At the suggestion of the superintendent, a choir of the women sang a hymn

in a correct and impressive manner; the workers in other parts of the room joining in the chorus. Some of the women were matronly, of middle age, and remarkably active; but here might be seen one or two advanced in life, and upon whom the affliction had fallen heavily, and whose demeanour reminded one of the querulous king:—

"All dark and comfortless!

* * * * *

Shut from the living, while among the living!
Dark as the grave amidst the bustling world!
At once from business and from pleasure barr'd!
No more to view the beauty of the Spring!
Nor see the face of kindred or of friend."

These cases were, however, the exceptions, and altogether rare. The majority of the women evinced remarkable quickness in superintending the pupils. Among the latter were some of nature's fairest children, cast in her finest moulds:

"Softness and sweetest innocence,
Like Nature in the world's first Spring."

There is something inexpressibly touching in the fair perfection of blind beauty!

From the girl's work-room we passed, between a range of apartments for the officers of the institution, to the boys' work-room, corresponding in size and position to the girls' room. In the former were several men and boys, employed in making wicker baskets, cradles, hampers, &c. Here, as in the girls' room, each person has his place on one of the two sides of the room, the centre being left clear and open. Above each worker, or nearly so, was hung a fiddle, reminding us of the invariable fondness of the blind for music; a degree of taste and feeling which would almost seem to have been given to them to guard against the melancholy which a sense of their privation might otherwise give rise to. The males were cheerful in their employment; and their work appeared to be well-executed. In an adjoining room, several were working at brown and white rope door-mats, neatly bordered with coloured work, and worsted rugs for hearths, carriages, &c. These articles are invariably well made, and the mats of "the Blind School" have been for many years known among housewives as proverbially more lasting than those generally manufactured. Another branch of the men's work may be mentioned here: this is shoe-making, which is mostly carried on in a room at the extremity of the western wing. Here are made the shoes for the inmates of the school; and slippers, &c., for sale. We saw here an aged pupil, who has been many years in the institution, and who has been long maintained here to superintend the shoemakers.

After inspecting the ground floor, we ascended to the upper story, where the educational business of the institution is principally carried on; as the lower floor is mostly appropriated to the industrial operations. In one of the large upper rooms, a number of boys were seated at a long desk, the teacher of reading taking one of the ends. This intelligent officer received his appointment about six years since, during which time, the progress of the pupils under his care has been satisfactory to the committee, as well as to those visitors who have, from time to time, made the necessary observations. Different systems of reading are taught, but that by raised or embossed letters, according to the plan of Mr. Alston, of Glasgow, is preferred by the committee. We examined three

or four of the boys in the New Testament, printed by this method; their proficiency was various: one read verses from the Epistles uninterruptedly, and with good emphasis and intelligence; another stumbled and failed to keep his fingers on the line; a third read somewhat more distinctly, &c. It should, however, be added, that the male pupils, generally, are reluctant to receive this instruction, as they think it will deprive them of acquiring a knowledge of the trade by which they are likely to be benefited on leaving the School. This will, in some measure, explain the moderate success of this branch of instruction in the establishment. The attempt to teach reading and writing was first made here in June, 1831, by Mr. Gall, under the most promising auspices; and the reader who is anxious to pursue the subject further, will find some very interesting details in Mr. Gall's "Origin and progress of Literature for the Blind." It may be as well to remind the reader that the proficiency of all blind pupils depends greatly upon whether they could read before they lost their sight, and whether they have been blind from their infancy, or never acquainted with letters.

We have already adverted to the fondness of blind persons for music, in noticing the violins hung up in the men and boys' working-room. The great accuracy of the ear, it is well known, gives to the blind a corresponding advantage in music; they depend entirely upon this sensitiveness, and hence they harmonise so well together, and keep such perfect accord in time, that Paganini, after listening to some pieces performed by the pupils of an institution for the blind, in Paris, declared that he never before had an adequate notion of what harmony was.

Many of the pupils, both male and female, at the St. George's Fields' School, have evinced similar taste and aptness for music; and hence, they are instructed in it, not as a mere amusement, but with a view to engagements as organists and teachers of psalmody. This instruction is given in the upper rooms, where an organ and piano-fortes are provided; we heard some of the pupils play, and more than one were competent to play or teach singing in any church or chapel.

It was not a little interesting to witness the taste and feeling with which the players executed several pieces of music; as well as the delight which the practice evidently afforded them. Every year, an opportunity is given them for a public display of their abilities, in a concert of sacred music, the proceeds of which are added to the funds of the institution. This performance usually takes place in October, in the chapel, or music room, a tastefully designed apartment which occupies the centre of the first floor. It is divided into four sections by archways, which support the tower; in the centre division to the front, immediately under the tower is placed the organ; on each side of which are ranged seats for the inmates of the establishment. The remainder, forming the largest compartment, is occupied by seats for the public; and in the centre, opposite the organ, is placed the reading desk. The ceiling is flat, formed into pannels by moulded ribs, with bosses at their intersections, the ends next the wall resting on brackets supported by corbels. The whole is grained in imitation of oak, and has a very pleasing effect, harmonizing well with the character of the building.

The religious instruction of the pupils may

here mention, is most carefully attended to: the Scriptures, both of the Old and New Testament, as well as the Liturgy, have been printed in embossed letters for this purpose, and the chaplain to the institution attends three times, at the least, in every week. The comforts and advantages thus afforded to the pupils are inestimable, since, by this means, they are enabled to acquire information for themselves, to "make their burthen easy," and, "to hold communion with their God in the perusal of his Holy Word."

In every portion of the establishment, we were much gratified with the neatness, extreme order, and cleanliness, in many instances exceeding the keeping of a private house. In the ground-floor apartments, as the work-rooms, which are most used, there was no indication of slovenliness; and in the bed-rooms, to use a familiar phrase, you may "dine off the floor."

We have already explained the origin and objects of this excellent institution, generally. It may, however, aid the good work to state that the pupils are clothed, boarded, lodged, and instructed. The applicants must not be under ten years of age, and not exceeding twenty-five; and none who have a greater degree of sight than will enable them to distinguish light from darkness, can be placed on the list of candidates. It has been found that pupils between the ages of twelve and eighteen have derived the greatest benefit from the school instruction. If they be in extreme indigence, they will, probably, be but little benefited by what is taught them; because the value of the instruction they may have received, will, when they leave the School, chiefly depend upon their means of carrying on the trade which they have learned. The pupils, we should add, regularly receive as pocket money, a part of their earnings; and when they leave the institution, a sum of money, and a set of tools for their respective trades are given to them.

Amidst the hundreds of benevolent foundations which constitute the highest worth of this vast metropolis, it would scarcely be possible to point to an establishment more important in its objects, or more complete in its provisions for carrying them out, than is "the School for the Indigent Blind." The munificence of those "who enjoy the luxury of doing good" has proved how extensively the great design has been appreciated from its first opening; and we can hardly picture any scheme of philanthropy worthier of public support than that which removes an afflicted class from a life of sorrow, indolence, and repining at their infirmities, to a scene of cheerful employment, and moral and religious culture; in short, from darkness, moral as well as physical, to the brightness of human excellence. It has long been proved that the blind possess unusual degrees of certain perceptions, a sort of benign compensation for their great privation; and to nurture betimes this capacity for active pursuits, is one of the noblest exercises of superior means and intelligence. With such an extended sphere of utility, and fostered by royal patronage, and the wisdom-tempered presidency of the Primate of all England, we trust, "the School for the Indigent Blind" will long flourish as a monument of the Christian spirit of the age.

A CHRISTMAS PARTY IN THE COUNTRY.

CHAP. V.¹

"Mrs. Barlow," asked Agnes, "have you ever read Mrs. Lester's School?"

"Yes, Agnes, I have read Laura's favourite book, and I am sure you are thinking of the little girl who would not have anything but grass and daisies in her country garden, because nothing else grew in the Drapers' Gardens in London; for I never read that tale without being strongly reminded of my own childhood. Indeed I know few books which charm both old and young as that book does."

"Well," said Frederic, "I really begin to see a herbal may become 'un veritable souvenir.' Sophia's next drawing is of a very small bright green plant, which she calls the Golden Saxifrage; whose younger days will that bring to light?"

"I claim that flower as my own memorandum," replied Sophia, "but it is not the very next flower in the portfolio; for you have overlooked a saxifrage which outshines them all,—the Saxifraga Hirculus, or Yellow Marsh Saxifrage."

"It joins delicacy of form to splendour of colour," remarked Rosaline, "for nothing can be more elegant than its gay golden flowers, which are enriched in the inside by numerous spots of a deeper tint. It is a rare plant, and has its native seat on bleak and high stations, which we north-country people call fells;—the shoulder of some mountain, where boggy spots are found; and it requires great care and attention to preserve it in more sheltered places. It is one of the many flowers 'born to blush unseen, and waste its sweetness on the desert air;' or rather its beauty, for sweetness it has none to waste."

"Now then, Sophia, what have you to say for this little flower?"

"I love it because it always seems to me a type of 'Green Erin,' and is as much associated in my mind with Ireland as the shamrock can be in that of her true-born sons."

"Is it like the shamrock?"

"The true shamrock seems as difficult to find as the origin of the round towers, around which it is said to flourish; but this certainly is not like the leaves worn on 'St. Patrick's day in the morning.'"

"It is very unlike the other saxifrages."

"It is not a saxifrage, but of the saxifrage tribe. Its botanical name is Chrysosplenium, which word is derived, I believe, from two Greek words, signifying gold and the spleen, and refers to its medicinal qualities. Yet, even this name has to me a different signification in its sound, for it so nearly resembles that of the precious stone Chrysoprasus, whilst its bright yellow-green hue is also like that stone, that I jumble in my mind Chrysosplenium and Chrysoprasus, and emeralds and the Emerald Isle in bright and inextricable confusion."

"Upon my word, Sophia," exclaimed Cyril, "you do make a most confused affair of it. Can you not give a more clear account?"

"Oh, yes. I can account for it myself, because the actual association of ideas is with the day when I first saw this humble beauty spread in luxuriant profusion on the Dublin mountains, when I was with my father in Ireland two years ago."

"In Ireland! You are a greater traveller than I had supposed, Sophia. Do tell me something of Ire-

land," asked Justine. "What took you to the mountains?"

"It was one of the many excursions kindly planned for me by our good friends, Dr. and Mrs. Gordon, with whom I was staying; and one of the pleasantest. There was no show place to be seen, but much natural beauty, as wild as if it had been ninety instead of nine miles from the city. After passing through the interminable rows of Jane-villes and Ann-villes, Larch-villes without a larch, and Elm-courts with nothing higher than a shrub near them; and admiring for the twentieth time the grandiloquent conceit of Rathgar Castle Cottage, as the name was placed in large letters before a castellated building of one story high, we came into a more rural district, where the April sun was shining on a green more lovely and more vivid than any I had ever seen before. Presently the road became more and more wild, now rising over a stony bank, which would have shaken to pieces any but Irish springs, now descending into a little valley threaded by a brawling brook, through which Tommy, the horse, dashed with an impetuosity which seemed to justify his master's partial assurance that he knew he was taking us to a charming spot. The last sign of civilization seemed past; and I think that last sign was a broken cart placed between two falling gate-posts, as a substitute for the absent gate."

"And a very clever contrivance too," said Mr. Barlow. "Some people would call it very Irish; but I fear slovenly farming is not altogether confined to that country; and if our eyes were as much upon the look out at home as abroad, we might make discoveries there which strike us as peculiar when seen in another land."

"I have frequently remarked this propensity to comment upon things from home, which at home would pass without notice," added Mrs. Loraine, "and thought it but a variation of the same propensity which leads us to see in other individuals those faults which self-love prevents us from detecting in our own mind and character—an illustration of that spirit which our blessed Saviour reproves in those who would pluck out the mote from their brother's eye, yet see not the beam in their own eye."

"I was much struck with this during my Irish visit," replied Sophia; "and the pretty Chrysosplenium taught me also the folly of admiring in strangers those amiable qualities which too often pass unappreciated in the dear circle at home; for it is to be found in our own neighbourhood; yet I had overlooked it here to be charmed with it far away."

"But beauty and amiability should charm us wherever we find them," remarked Justine; "and perhaps the plant was in greater beauty there, or in greater luxuriance, and thus forced itself upon your notice. But pray continue your account of your excursion, for I have much curiosity to know what is to be found in the inside of an Irish cabin. Did you contrive to get into one?"

"Oh yes! our friend Tommy at length drew us up a rocky pass called the Breeks of Balinascoreney, where we once more saw a few cottages, or cabins, of a very humble description, to be sure, but not of the lowest class. At one of these we begged accommodation for ourselves and our horse, which was very cheerfully granted by the good-looking mistress. Mrs. Gordon remained with her to rest, whilst the Doctor and I gratified our aspiring natures by ascending nearly to the summit of the hill, for which trouble we were rewarded by a most lovely view. Mountains and rocks below us formed the foreground of the picture, and bounded it on the south. Before us, westward, lay the city of Dublin and part of its lovely bay, the blue waters laving the shore as gently as if caressing the thing they loved; whilst to the north was another range of grassy hills, over which peeped the faint grey outline of Slieve Donard, at the distance of sixty miles. Nothing could be more lovely! The very remembrance of the pure air and brilliant sunshine is renewed enjoyment!"

"I love to hear Sophia recount the pleasures of the fresh air," said her father, "for the task always brings again the glow to her cheeks, and fills her with gratitude for so cheap a blessing, reminding me of what Wordsworth says,—

"Nature never did betray
The heart that loved her; 'tis her privilege,
Through all the years of this our life, to lead
From joy to joy; for she can so inform
The mind that is within us, so impress
With quietness and beauty, and so feed
With lofty thoughts, that neither evil tongues,
Rash judgments, nor the sneers of selfish men,
Shall e'er prevail against us, or disturb
Our cheerful faith, that all which we behold
Is full of blessings."

"I do love to see the love of Nature my children's first love."

"Not our very first love either: that must have been yours and my n...'. I almost feel ashamed to say our enjoyment of the beauties of nature was interrupted by 'the keen demand of appetite'; and on re-entering the cabin we were not a little pleased to see how well Mrs. Gordon's handy fingers had spread the table for us; and in addition to the contents of our travelling-basket, the hostess had supplied a profusion of fresh eggs, which she roasted in the embers, and pressed upon us with true Irish hospitality."

"But was not the place too dirty for you to enjoy anything?"

"Indeed, it was not. I own it was not quite a drawing-room; but the furniture was good and clean, and the dresser displayed nice delf and other comforts, though there was a mud floor, and the ceiling merely consisted of the furze which supported the thatch, whilst a large brood of fowls had undisputed possession of one corner of the room, where they kept flying up and down from a beam which was over a good store of fuel and potatoes. I was laughed at for my nicety in chasing the fowls out of the cabin before I sat down to dinner; but I redeemed my character by patting two large dogs which stationed themselves beside us, and begged for a share in our good things."

"Certainly this could not be called a wretched Irish cabin."

"Oh no! it belonged to one of the class of respectable farmers. Two or three children, who came in from school, were tolerably well clothed; and the good master soon made his appearance with his horse, cart, and eldest daughter, a very pretty girl, whose black eyes gave us many furtive glances, and who amused me greatly by the mixture of archness, cunning, and simplicity, with which she contrived to draw me away from the party, under the pretext of showing me a view I had not seen, and then blushing, and smiling, and curtseying, asked me how I liked Ireland. 'And sure,' she added, 'your ladyship don't dislike the Irish—sure you would not object to taking an Irish servant; and I would so like to go with you to England—it would be such improvement to learn the good, tidy, English ways. Oh, I would like much to go —'"

"Well, Sophia, why did you not bring her? I wonder you could have the heart to refuse!" exclaimed Charles. "Just imagine old Watson having a wild Irish girl to teach. The very exercise of scolding her would cure the rheumatism."

"I felt quite sorry to crush poor Bridget's hope, wild as it was," said Sophia; "and turned homewards with regret."

"How long did your regret last, Sophia, after you got into the April sunshine?" asked Mr. Lorraine. "I suspect hardly as long as an April shower?"

"The sea breeze wafted it all away as we walked down the heights of Ballinacorney, where each side of the road was a treasury of spring flowers—primroses, cowslips, wood-anemones, oxalis, and hairy...; and where, close by a trickling rill, I discovered... chryso-

plenium, its most minute golden flowers absolutely glittering in their tiny nooks at the foot of each green leaf. I never saw anything so cheerful as its aspect; and, with the help of a knife from the basket store, I ladened the carriage with a mass of its verdure, and with numerous roots of cowslips and primroses for Mrs. Gordon's garden. The very plant from which that drawing was made, was one which I brought home; so I hope, Frederick, my long story has apologised for the favour with which I regard my gem from the Emerald Isle."

"It has really been rather a long story," said Mrs. Lorraine. "Poor Little Laura has been looking sleepy for the last quarter of an hour, but in reply to her mamma's signal for retiring, begs to hear the evening's charade before she goes."

"Yes, please," said Laura; "do let me stay, and try to guess it; and, first, let Sophia tell us what the Golden Saxifrage is good for?"

"I am afraid it is good for nothing but to look pretty," answered Sophia; "at least, in the present day, in spite of its name, it is not used by the herbalists; but it is one of the many proofs which flowers afford of the overflowing bounty of Him who has spread beauty over the lowly places of the earth, and gives cheerfulness and peace to many a humble and lowly heart."

"Now then, my dear mother," said Cyril, "if you will hand me the charade, Laura shall read it herself—though it looks rather a long one." And, drawing the little girl to him, gave her the following:—

By what shall we my First pourtry?

Call it gloomy, call it gay,

Call it wretched, call it grand,

The shame and glory of our land.

Seat of learning, round of pleasure,

Haunt of vice, and store of treasure;

Into whose vast bosom pours

Exhaustless wealth from farthest shores,

Yet, in the darkness of her breast,

Hides grief by poverty oppress.

Morning views not ought so fair

As the bright things which glitter there;

Nor does the night her shadow throw

O'er scenes of deeper guilt and woe.

And here, with gorgeous panoply,

Of comes my Second sweeping by;

Yet not the less will shrink aside

In dim obscurity to hide.

Some say it was not made for man,

And yet, deny it if you can,

In all, suppress it as we may,

'Twill sometimes struggle into day;

And gentlest minds may own its thrall,

Whilst those whom it would high install

Will find it oft may have a fall.

My First has many a gilded dome

Where finds my Second sitting home;

My First has many a humble shed

Where my bright whole may rear her head,

Tended by humble hands with care,

And pining for a purer air.

My pretty Whole! 'Tis Nature's child

Lurking within the woodlands wild,

A dweller on the lonely rock,

And yet, amid the city's smoke,

To the spent artisan 'twill bring

Remembrance of life's gay spring,

And from the town's close dirty lane

Allure his memory back again

To early scenes, till from his eye

The gloomy buildings seem to fly,

And childhood's home his heart will bless

Amidst the city's wilderness.

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

LONGEVITY OF THE TORTOISE.

In the library of Lambeth Palace is the shell of a tortoise, brought there in 1623. It lived till 1730, and was then accidentally killed. Another, in the palace at Fulham, procured by Bishop Laud in 1628, died in 1759. Tortoises are proverbial for their longevity; one at Peterborough lived 220 years.—*Sir Richard Phillips*.

CUNNING OF THE FOX.

WHEN living in Ross-shire, I went one morning in July, before daybreak, to endeavour to shoot a stag, who had been complained of very much by an adjoining farmer, as having done great damage to his crops. Just after it was daylight, I saw a large fox come very quietly along the edge of the plantation in which I was concealed; he looked with great care over the turf wall into the field, and seemed to long very much to get hold of some hares that were feeding in it, but apparently knew that he had no chance of catching one by dint of running; after considering a short time, he seemed to have formed his plans, and having examined the different gaps in the wall by which the hares might be supposed to go in and out, he fixed upon the one that seemed the most frequented, and laid himself down close to it in an attitude like a cat watching a mouse-hole. Cunning as he was, he was too intent on his own hunting to be aware that I was within twenty yards of him with a loaded rifle, and able to watch every movement he made; I was much amazed to see the fellow so completely outwitted, and kept my rifle ready to shoot him if he found me out and attempted to escape. In the mean time I watched all his plans: he first, with great silence and care, scraped a small hollow in the ground, throwing up the sand as a kind of screen between his hiding-place and the hares' mouset. Every now and then, however, he stopped to listen, and sometimes to take a most cautious peep into the field; when he had done this, he laid himself down in a convenient posture for springing on his prey, and remained perfectly motionless, with the exception of an occasional reconnoitre of the feeding hares. When the sun began to rise, they came one by one from the field to the cover of the plantation; three had already come in without passing by his ambush; one of them came within twenty yards of him, but he made no movement beyond crouching still more flatly to the ground. Presently two came directly towards him; though he did not venture to look up, I saw by an involuntary motion of his ears that those quick organs had already warned him of their approach: the two hares came through the gap together, and the fox, springing with the quickness of lightning, caught one and killed her immediately; he then lifted up his booty and was carrying it off like a retriever, when my rifle ball stopped his course by passing through his backbone, and I went up and dispatched him. After seeing this I never wondered again as to how a fox could make a prey of animals much quicker than himself, and apparently quite as cunning.—*Wild Sports and Natural History of the Highlands, by Charles St. John, Esq.*

THE BEAUTY OF THE SKY.

It is a strange thing how little in general people know about the sky. It is the part of creation in which nature has done more for the sake of pleasing man, more for the sole and evident purpose of talking to him and teaching him, than in any other of her works, and it is just the part in which we least attend to her. There are not many of her other works in which some more material or essential purpose than the mere pleasing of

man is not answered by every part of their organization; but every essential purpose of the sky might, as far as we know, be answered, if once in three days, or thereabouts, a great black ugly rain cloud were broken up over the blue, and everything well watered, and so all left blue again until next time, with perhaps a film of morning and evening mist for dew. But instead of this, there is not a moment of any day of our lives when nature is not producing scene after scene, picture after picture, glory after glory, and working still upon such exquisite and constant principles of the most perfect beauty, that it is quite certain it is all done for us, and intended for our perpetual pleasure.—*Modern Painters*.

THE CAPTAIN MASTERED.

Another of our skipper's stories was the finding a vessel yawing about in a most fearful way, steering wild. He at first determined to give her a wide berth, but afterwards thought he would inquire the longitude. He therefore hailed her, "What ship is that?" "The Samuel Walker." "Where are you from?" "From Bosting, down east." "Who commands her?" "Why, I undertuk her, but I swear she is too much for me."—*Echoes from the Backwoods*.

I have often been astonished at the softness in which other minds seem to have passed their day: the ripened pasture and clustering vineyards of imagination: the mental arcadia in which they describe themselves as having loitered from year to year. Yet, can I have faith in this perpetual Claude Lorraine pencil—this undying verdure of the soil—this gold and purple suffusion of the sky—those pomps of the palace and the pencil with their pageants and nymphs, giving life to their landscape; while mine was a continual encounter with difficulty, a continual summons to self-control?—A march, not unlike that of the climber up the side of Etna; every step through ruins, the vestiges of former conflagrations; the ground I trode, rocks that had once been flame; every advance a new trial of my feelings or my fortitude; every stage of the ascent leading me, like the traveller, into a higher region, of sand or ashes; until, at the highest, I stood in a circle of eternal frost, with all the rich and human landscape below fading away in distance, and looked down only on a gulph of fire.—*Marston*.

THE Chinese proverb says, "A lie has no legs, and cannot stand; but it has wings, and can fly far and wide."—*Hochelaga*.

THE noblest part of a friend is an honest boldness in the notifying of errors. He that tells me of a fault, aiming at my good, I must think him wise and faithful; wise, in spying that which I see not; faithful, in a plain admonishment, not tainted with flattery.—*Feltham's Resolves*.

It is startling to reflect that all the time and energy of a multitude of persons of genius, talent and knowledge, is expended in endeavours to demonstrate each others' errors."—*Liebig*.

N.B. The Second Volume of this Periodical is now ready; covers for binding, with table of contents, may be ordered of any Bookseller.

The Haunted Moor.

Translated from Langbein.

BY EMMA MARTIN.

THE night was dark, and o'er the gable
The storm broke with its wintry power,
The good old man read in the Bible,
And, seven! struck the old church tower.
"Oh Heaven!" cried Ellen, paler growing,
"Struck seven! and George is not here!
He lost his way this dark night's blowing!
How throbs my anxious heart with fear!"

The Forester the wide heath over
Bore her betrothed Bridegroom's name,
Her heart beat joy to meet her lover
Whene'er the gallant youngster came;
Last year saw every evening bringing,
At sunset, George to greet the Maid,
But now, when evening chimes were ringing
Five! it was dark, and yet he stayed.

Poor Ellen ran out to the meeting,
And soon returned—with 'wildered eye
And breathless haste her father greeting—
Into the farm-house tremblingly.
"Oh help!" she cried, "a mournful wailing
Comes from the reedy waters dun!
'Tis George—he cries—his strength is failing—
Oh father! haste! to save your son!"

The old man looked up and shook lightly
His hoary locks, "My child! thou know'st
An hundred years there wandered nightly,
Just there, the noble Gertrude's Ghost.
Astray at night among the marshes
Her horses and her carriage sank,
The Countess o'er the moor still paces,
And warns the traveller from the bank."

"Oh! ere his heart break! come!" cried Ellen,
"And speak not of an idle tale!
His cries upon my ear were swelling!
Could I to know his accents fail?"
Yet, trusting to the village saying—
Though on her knees she begged—in doubt
Sato Martin yet, his help delaying,
And in despair she hurried out.

"Oh help!" she cried at every dwelling,
"A man is drowning in the lake!
He groans—oh! list the tale I'm telling—
I ask it for our Saviour's sake!"
Yet—as were all in league united—
"It were but so much labour lost."
They stupid said—her misery slighted—
"Tis nothing but the Lady's ghost."

"Oh God!" she cried, her arms extending,
"No heart of rock would aid allow—
Thou—who art Love—let that, descending,
Give me the strength to save him now!"
Then quickly felt she that a fountain
Of courage in her breast arose,
And swiftly rushed she 'neath the mountain,
Whence still the wild lamenting goes.

The old man in the house felt dreary
As all the world upon him lay,
And through the fields he hastened, weary,
That stormy winter's night away.
He called 'midst roaring wind and water
On Ellen's name an hundred times,
But 'stead of his beloved daughter
There answered only echo-chimes.

The village his lamentings raising,
The men all now to rescue throng—
And twenty torches' light was blazing
At midnight all the Pool along.
There found they—horror all surpassing!
Close to the shore, in sedges wide,
Their stiffened bodies yet embracing
Whom death itself could not divide.

White as a spectre with his sorrow
Sank Martin in his neighbours' arms,
And this disastrous night no morrow,
No joy from memory ever charms.
A grey stone, with two doves abiding,
The country mason's labours gave,
With—"Flee from Superstition's guiding!
That laid them in their early grave."

THE CINQUE PORTS.

HISTORICAL SKETCH OF SANDWICH.

"As generations come and go,
Their arts, their customs, ebb and flow;
Fate, fortune, sweep strong powers away,
And feeble, of themselves, decay."

WORDSWORTH.

BEFORE commencing our notices of this once celebrated but now almost unknown town, it may be advisable briefly to allude to the physical changes which time has produced on the coast on which Sandwich once lay, and in the island (Thanet) on which it so closely abuts.

The river dividing Thanet from the continent of Kent fell into the sea at Sandwich, and was called the Stour, and this (or rather another stream which flowed into it), winding to the north-west so as to form the island, reached the sea again near Reculver, where it was called formerly the Yenlade, but afterwards, as the waters began to fail, it was known by the appropriate appellation of *Wantsume*, a name which it still retains. At both these mouths the sea rushed freely, and flowed entirely round the island, forming, as we have said, a broad estuary, which offered a safe and inviting passage for ships of the largest burthen, and was indeed the accustomed route from France to London. The water at the narrowest part was upwards of a mile and a half in width, and in some places four miles.

The wasting of these waters, and the decay of the channel, would in all likelihood have been progressing for many years before the circumstance was noted, but the alteration had become quite visible in Bede's time. The Stour was neither so wide nor so rapid as it had been; the Yenlade was beginning to be known as the Wantsume; and the proprietors were inadvertently adding to the mischief, by securing those lands from which the sea had retired, from the possibility of being again overflowed.

At the time this estuary was as we have described it at first, the lands along the course of the river which now are luxuriant pasture were of course beneath the waters, which also flowed over the low grounds almost as far as Canterbury; and on the coast from Ramsgate to Deal extended one broad bay, the tides of which washed the foot of the hill on which Richborough Castle stands, now two miles inland. Ebbsfleet, where a narrow creek ran inland, was a common and convenient landing place, and the site of the present town of

Sandwich was under the waves.

It was probably as a successor to or substitute for Richborough, when the sea retiring from it destroyed its utility as a port, that Sandwich was built, on ground also redeemed from the ocean. It was built along the southern margin of the river Stour, and on the sea sands, as its name *Sond-wic* or *Sondwych* fully testifies; and this title also evidences its Saxon origin. The name first occurs in history about the year A.D. 664. The town was also called Lundenwich, as lying in the way, or rather being the usual passage, to London.

From the time of its origin, the property of this town was vested in the reigning monarch, until the year A.D. 979, when King Ethelred gave it to Christchurch in Canterbury to the use of the monks, free from all secular service and fiscal tribute except the repelling invasions, and the repairing of bridges and castles. King Knute confirmed, or rather (for all the property of the island was his by conquest) renewed this gift, after having partly rebuilt and considerably improved the town. William the Conqueror, and Henry the Second, confirmed to the monks of Christchurch all their liberties and customs in Sandwich. But in the reign of Edward the First, these reverend proprietors gave up to the king a chief proportion of their rights in exchange for land in another part of Kent: and, the reservations made in this agreement being found practically inconvenient, a further compromise was made in the reign of Edward the Third, whereby the monks ceded all their rights, privileges, and possessions in the town and port of Sandwich.

It was in Edward the Confessor's reign, who resided here for a considerable time, that Sandwich was made a Cinque Port, and it has always ranked next to Hastings in precedency. It was first incorporated by Edward the Third, and the meeting by which the Mayor is annually elected is convened by the blast of a brass horn of great antiquity, which is sounded before the house of every one qualified to vote. All municipal elections, decrees, &c. are made by the corporate body assembled by the blast of this ancient horn.

Some of these ancient laws are amusing. In 1493 it was decreed that a person refusing to take a particular office, to which he was appointed by the meeting, should not be permitted to bake or brew, or that, if he did bake or brew, the Commons might seize the bread and beer, and apply it to their own use. We can hardly in these days understand how very awkward a predicament this must have been, when beer shops and public bake-houses were not.

Another decree of about the same period was that no person be elected a jurat, who has not dwelt and kept house in the town a year and a day, *he and his wife together*. A general law of this kind might become a national benefit; or would it not rather perhaps in these days become the nucleus of another league to agitate for repeal!

Sandwich seems gradually to have increased in wealth and consequence from the time when, from the decay of the Portus Rutupinus (Richborough), it became a substitute for, and successor to, that celebrated haven, though, like other towns on this coast, it suffered at times fearfully from the ravages of the Danes. But the inhabitants made a spirited, and not unfrequently a successful, opposition to these pirates. To enter into any detailed account of these times, would merely be to multiply

descriptions of cruelty, always disgusting and never profitable. Pass we therefore over them. Rather would we assist the over-proud and over-zealous yet well-intentioned Bishop and Martyr, St. Thomas à Becket in his flight, when after a close concealment of many days at Eastry, he passed hastily through Sandwich, and, leaving the town by the Fishers' Gate, embarked in a small fishing boat which had been secretly hired for him, and landed at Gravelines the same evening. Or gladly would we join the throng who are so eagerly crowding towards the quay just six years afterwards, to welcome the Prelate on his return to his home, and to escort him with honour through the Canterbury Gate.

But a few years pass, and a still more illustrious exile, a crowned and lion-hearted king, steps on the quay at Sandwich, amid the deafening acclamations of his subjects, assembled from every quarter four miles around, to obtain a glance of the brave monarch, who, on his return from the Holy Wars, was betrayed by the guile of the cowardly Duke of Austria, and, in defiance of every feeling of chivalry and honour, was by him cast into a dungeon. For months he languished there, and, as every body knows, the place of his confinement was discovered by a faithful minstrel. He was at length released, finished his journey safely, and is now treading his own soil, breathing his native air. Loud, deafening, are the heartfelt shouts that greet him, splendid the carriage prepared for him, magnificent the *cortège* which awaits him. But he withdraws from all; declines all honours, all state, all parade, and in humble guise and on foot, he proceeds from Sandwich to Canterbury, there to offer before the High Altar rich gifts and oblations, and the more acceptable sacrifice of a heart softened by gratitude for the perils he had escaped. This paramount duty performed, Richard "is himself again."

Many such scenes of thrilling interest the annals of Sandwich bear witness to, and many passages of a highly chivalric nature occurred here, for, as we have said, this town ranked second among the Cinque Ports. At first it furnished only five ships to the general quota, but so rapid was its advance in wealth and importance, that, various alterations being made from time to time in the allotments according to the varying circumstances of the Ports, instead of five, Sandwich was shortly taxed to the amount of ten ships and a half. It is said to have been the first place in England where ships were built.

Sandwich was very often the rendezvous for fleets which were especially commanded by the king in person; and this was particularly the case in the reign of the chivalrous Edward III. Indeed, during all the French wars of these times, it was the accustomed rendezvous of the fleets and armies, and the most usual place of embarkation and debarkation. It is said by some authors, that, after the battle of Poitiers, when the Black Prince threw his former laurels into insignificance by the bright ones he gathered there, he landed at Sandwich,¹ with his royal prisoners, John, King of France, and Philip, the monarch's youngest son, a promising youth of fourteen, who had fought bravely at his father's side, and yielded his sword at the same time.

While in the zenith of glory and prosperity,

(1) Some authors say Plymouth.

while vigorously engaged in commerce, and while the favourite rendezvous and port for kings and armies to sojourn and embark, Sandwich was also rich in those charitable institutions which at all times illumine and sanctify worldly pomp, but which formed a peculiar feature of those times of rude pomp and barbaric splendour.

In early times the bishop of a diocese was taxed with the care of all the poor; but afterwards, when churches acquired fixed revenues, a certain proportion was laid aside for the behoof of the poor, and houses of charity were built for their accommodation. But such works of piety were not confined to those who had assumed a religious garb. Many a lofty chieftain has immortalized his name by a charitable donation, without which his "deeds of derring do," chivalrous as they might be, would have been forgotten; and the name of many a noble matron has descended through after generations in the prayers of those to whose welfare she had sacrificed her worldly wealth.

The Hospital of St. Bartholomew, in Sandwich, is one of those institutions originating in private beneficence. In its original it was meant only for pilgrims and travellers. Leland describes it as "an hospital, withoute the town, fyrst ordeined for *maryners desesynd and hurte*."

It is worthy of note, that very many of these ancient hospitals in and near the Cinque Ports, if not especially founded for travellers (as this seems to have been), were yet all expressly bound by the rules of their foundation, not merely to show hospitality as the general rule of the age, but to be especially careful of pilgrims and travellers—to show them every solace, to provide them every succour, and to furnish them, as far as possible, with the means of prosecuting their journey. This affectionate solicitude for the wayfarer arose, doubtless, from the national excitement with regard to the Holy Wars, which would make all bound to or returning from them objects of especial interest; and still more, from the feelings of respect, and almost of veneration, which attached to all those pilgrims who, from motives of piety, sought

"Those holy fields,
Over whose acres walked those blessed feet,
Which eighteen hundred years ago were nailed,
For our advantage, on the bitter cross."

Thousands of pilgrims were annually passing and re-passing "the Ports."

The Hospital of St. Bartholomew remains where it was originally founded, on the high road, or rather, at the junction of two high roads, about a mile out of Sandwich, the site being chosen *as convenient for travellers*. As it existed in the beginning of the fourteenth century, the brethren and sisters had comfortable apartments, but not separate houses. The whole was a connected building, with public hall, bakehouse, and kitchen, with the chapel a few paces off. But now each brother and sister has a separate abode; and the sixteen cottages, embosomed each in its own garden, and surrounded by rich orchards and corn-fields, convey to the mind every idea of comfort and abundance.

A reference to some of the peculiar domestic regulations, which were strictly enforced here formerly, will be acceptable, as throwing light on the manners of the times.

"Every fortnight the sisters go to oven,¹ and

make bread for the hospital. The allowance is seven loaves to each person for fourteen days.

"Every brother and sister is allowed twopence a week for beer; and, once a year, towards Christmas, each person is to have a hog out of the common stock.

"Every day there is prepared in the kitchen, for common use, a quantity of porridge, of beans, peas, or other vegetables, and every person may put his or her meat into the common pot; and the cook shall return it when sufficiently boiled, with a basin of porridge. But no one shall be permitted to make use of a separate pot, on the common fire, because the hospital is not bound to provide a fire but for the common boiler.

"Every Sunday after dinner the brothers and sisters assemble together in the hall, and receive from the master a penny a-piece; of which each contributes a farthing for a jug of ale, which they drink together, to promote brotherly affection: and the master obliges every one to attend this meeting. At their departure, and every day at the same hour, they should pray for the founders and benefactors of the hospital, and for all the faithful, living and dead."

Some of the customs of St. John's Hospital, which, impoverished, decaying, and insignificant, does yet also exist in Sandwich, were more peculiar.

The daily allowance here to each brother and sister was a mess of porridge, a farthing loaf, and a farthing for beer, *if the income would admit of it*. When any part of the building wanted repair, however, they inevitably lost the beer money, as the income of the house did not suffice for both.

Some of the brothers attended the churches in Sandwich every Sunday with a pewter dish, soliciting money to buy meat for dinner on that day. Another brother was deputed to go through the county of Kent, or wherever the brethren and sisters should direct, on an ass, with a public letter, soliciting charity on behalf of the hospital: and he collected sometimes ten shillings a year, sometimes a mark *above his expenses*.

One of the brothers went about in harvest with a cart, collecting wheat and other corn, which was made into bread, and divided amongst them. And at Christmas they sent a brother with a sack to the houses of the better sort of people in the town and its neighbourhood to beg bread, which was likewise divided equally amongst them.

Less decayed than this, but far from emulating the life and prosperity of St. Bartholomew's, is the Hospital of St. Thomas, which still affords a shelter and provision for four women and eight men. On a desk in the homely, ancient, low-browed hall, is chained a tattered copy of Foxe's Acts and Monuments, and also an ancient Bible. A few pictures hang round the walls; one of a beautiful lady, who bled to death from having pricked her finger. Another represents a fresh-coloured, fleshy, somewhat heavy-looking man, in a snuff-brown coat, with wide cuffs and large pockets, and a full-bottomed wig, evidently intended for George I. An ancient inmate of the hospital, who seemed to be somewhat of a literary turn, said that "he had been told that it was George I., but he was himself inclined to think that it was Charles I. Didn't I think so?" Overpowered at the moment by the idea of the refined, sensitive, martyred Charles, with chubby cheeks, and in a Dutchman's coat, I

(1) A common phrase in this part of Kent: orig. *cuwt ad furnum*.

answered, somewhat peremptorily, "No!" but I sadly repented that I had so abruptly destroyed what was evidently a very favourite hypothesis, when I observed the discomfited air with which the poor old man retired.

A house of the Carmelites here was suppressed by Henry VIII.; and there were various other chantries and religious institutions of which no relic exists. But, before the hand of the spoiler was aimed at some of its ornaments, a heavier doom, which was fast hastening to its accomplishment, had been hanging over the town itself. The harbour, at once the cause of its existence, and the source of its opulence and prosperity, was fast decaying, "by the abundance of the light sande driven in by the sea;" and in the reign of Richard III. suit was made to the king for a new haven.

We remarked at the commencement of this sketch, that, at a very early period, the waters of the estuary were visibly decreasing, and that, from this circumstance, the river Yenlade had obtained the soubriquet of Wantsume, since become its customary appellation; that, at the other end of the estuary, the sea had retired from the port of Richborough, and that Sandwich, as a subsidiary haven, was built on the edge of the waters, as they then rolled. But, during all the years that had since passed, they were still constantly and gradually declining from their ancient channel, and had still continued to contribute, in some degree, to their own blocking out, by a perpetual deposit of sand at the mouth of the estuary; and this evil had been increased, perpetuated, and perhaps completed, by the proprietors of land barricading all the ground from which the sea had partially, and perhaps but temporarily retired, against its future encroachments. The effect of these circumstances in the course of years was most disastrous to Sandwich. The town became absolutely inland; approach to her harbour became practicable only along the winding channel of the river Stour, and this daily more difficult from the decrease of water, even from the bed of the river. At length, an accident, which looked like fatality, checked the hopes of the most sanguine. This was the sinking, in Henry VIII.'s reign, of a large ship at the very entrance of the harbour, which shortly, from the accumulation of sand and mud about it, completely barred the passage.

Dependent for her prosperity from her first foundation on her haven, it may naturally be supposed that the utter and irremediable decay of this bulwark of her fortunes had a ruinous effect on the town of Sandwich. Her navy and mariners dwindled almost to nothing; her quay became lonely, her streets deserted, her houses tenantless, and her remaining inhabitants deeply impoverished.

Her fortunes experienced a temporary resuscitation in the days of Elizabeth, when that queen opened her dominions to the refugee Protestants, driven by persecution from Brabant and Flanders. Upwards of four hundred of these emigrants settled in Sandwich, where they introduced the manufacture of sayes, baize, and flannel; and, notwithstanding the obstructions which they met with from the jealousy of the native inhabitants, they established a flourishing trade, and compelled even the original occupants of the town to rejoice in their coming, so brisk and animated was once more the appearance of things. Elizabeth herself

honoured the town with a visit, inspected these manufactures, viewed the arrangements of the newly-founded Grammar-School, and, by her gracious appreciation of their endeavours to please her, persuaded the happy and hopeful inhabitants of Sandwich that the days of their pride and glory were not quite sped.

But this was a mere lightening before extinction; for, in the succeeding reign, the Company of Merchant Adventurers was patronized by James, who appropriated to them the trade to Germany and the Low Countries. So the newly established manufactures in Sandwich sank to decay as speedily as they had arisen; and her newly excited energies subsided, not to awaken again. Sandwich is known but as a memory of the past; her present position being that only of an insignificant country town; her present appearance lonely, deserted, and silent; and her present inhabitants those who "mark no years with their deeds, as slow they pass along."

THE SENSE OF TOUCH,

AS MEASURED MECHANICALLY.

SOME very remarkable experiments were made a few years ago, to determine the relative sensibility of different parts of the body in respect to touch, by Dr. Henry Ernst Weber of Leipsic. The object in view was to obtain mechanical demonstration of a fact which has been generally known to most persons, viz. that some portions of the skin are better adapted than others to receive impressions from contact with external bodies. Dr. Graves of Dublin has published in the "Dublin Medical Journal," an analysis of Weber's investigation, together with observations derived from his own experience; and we shall here give such parts of the results as, being free from scientific phraseology, may be understood by every one.

Weber endeavoured to determine in various ways the relative sensibility of different parts of the body, both in combination with, and apart from, the sense of touch, simply so called. Thus, he speaks of the faculty which the skin possesses of estimating and comparing different pressures made upon its surface. If both the right and the left hand of the same individual are supported on cushions, and he keeps his eyes shut while unequal weights are placed on the two hands, he will, if the difference of the weights be considerable, be able to tell on which hand the heavier lies; but if the hands be raised from the cushions, a much smaller difference of weight is appreciable; for, in the one case, there is nothing but the sensibility to pressure which can determine the difference, whereas in the other case there is the amount of muscular exertion necessary to support the weights, and any inequality in this amount seems to be easily discernible. This last-named power appears to be very unequally developed in different individuals, but, in general, Weber found that men who are accustomed to estimate weights by poising them in their hands, will distinguish perfectly between two differing only by a thirtieth part; say, for instance, one of thirty ounces, and the other of twenty-nine. In such modes of comparing, the two weights are not held in the two hands, but both in the same hand, one after another. An interval of five, ten, or even twenty seconds may elapse between the poising of the two weights without destroying the power of discrimination, but an interval of forty seconds was found to weaken the impression of the first weight, and therefore to destroy the accuracy of the estimate. It was farther ascertained by Weber, that, in most men, the left side of the body, and the left

extremities, enjoy a more accurate perception of weight than the right, so far as weight is estimated by pressure: of fourteen different persons experimented on, in eleven the left side of the body and the left extremities were found to be more sensible of weight measured by pressure, than the right; in two the contrary was observed, and in one only no difference between the sides could be detected. On this experiment Dr. Graves remarks:—"He (Weber) offers no satisfactory explanation of this very remarkable, and hitherto unobserved phenomenon, which is obviously of some value, as marking an original difference between the nervous power of the right extremities, and right side of the trunk, as compared with the left; a difference which favors the idea, now indeed generally admitted, that we cannot explain the circumstance of man being right-handed and right-footed, except on the hypothesis of an original difference in the vital powers of the right and left halves of the body."

A part of Weber's experiments had relation to the accuracy of our judgment in matters of temperature. The skin is so constituted as to render very minute changes of temperature, even so little as one-third of a degree, appreciable. To effect this, the difference is not to be tested by the two hands, or two different parts of the body, but by exposing the hand successively to two different portions of water, the one a little colder than the other; and the temperature ought not to be very far different from that of the human body, for we cannot estimate differences accurately if the temperature be much above or below blood-heat. Weber pointed out the fact that our impressions of heat and cold are dependent a good deal on the amount of surface exposed to the action of temperature; thus, if the fore-finger of one hand be immersed in water at 104°, while the whole of the other hand be immersed in water at 102°, the latter, although really the colder, will appear to us to be warmer, on account of the larger surface exposed to a temperature exceeding blood-heat. He also found that the left-hand is, in most persons, more sensible of heat or cold than the right; thus, when the hands of a person lying in bed, and of exactly the same temperature, were plunged in separate vessels of hot water, the left-hand was in general believed by the person to be in the hotter medium, even though the water was really one or two degrees colder than that in the other vessel. This circumstance is attributed principally to the greater thinness of the skin on the left-hand, arising from its being less frequently used.

But the most remarkable part of Weber's investigation related to the measurement of the delicacy of touch by means of a pair of compasses, a mode seemingly strange, but in his hands productive of curious and valuable results. Dr. Graves states the principle thus. If we touch the skin with a pair of compasses whose points are one inch asunder, while the person so touched shuts his eyes, he at once perceives his skin to be touched in two places. By continually diminishing the distance between the two points, we finally arrive at a degree of approximation where the person feels his skin to be touched by but one body; but he describes this body as being a little longer in one direction than another, and it appears that this longer diameter corresponds with the line of junction between the two points of the compass. When these points are brought still nearer together, this inequality in the diameters is no longer felt, and the person has a definite perception of being touched by but one body. Now, Weber has determined, by experiment, that the different portions of the surface of the body vary considerably in accuracy of touch, as measured by the distance at which the points of the compass can be still distinguished from each other; for those parts which are endowed with great power of touch will continue to give notice of two points at such a small distance apart, that, when examined by less sensitive portions of the skin, they are erroneously judged to be but one.

Weber's method, then, was to apply the points of an opened pair of compasses to different parts of the body in succession, and gradually to bring the points together, until the separation between them was not felt by the skin, but both seemed to produce one impression. This point is what Dr. Graves proposes to call the "limit of confusion;" and, by measuring the opening with a graduated scale, a numerical measure of the sensitiveness of touch in different parts of the body may be obtained. Weber adopted the Paris line (equivalent to about $\frac{1}{4}$ th of an English inch) as the unit of measure, by which different results might be compared.

Weber found the tip of the tongue to be the most sensitive part of the body when tested by these means. When the points of the compass were but half a line apart, the feeling of the two distinct points existed; and when they were within two-fifths of a line, although the person seemed to feel but one touching body, he nevertheless felt it to be longer in one direction than another. On another part of the tongue it was found that when the points of the applied compasses were as much as three lines asunder, they seemed to be as one touching point; thereby showing less acuteness of touch. In this way Weber examined, both on his own person and on others, the relative sensibility of different parts, and gives a table, in which, opposite to the part named, is given the smallest distances at which the two points of the compasses could be felt to be still apart, and the direction between them estimated. Of this table the following are a few items. Tip of the tongue, $\frac{1}{2}$ line; inner surface of the finger tips, 1 line; red part of the lips 2 lines; tip of the nose, 3 lines; the portion of the lips which is not red, 4 lines; edge of the tongue one inch from its point, 4 lines; palm of the hand, 5 lines; surface of the eyelid, 5 lines; centre of the hard palate, 6 lines; the membrane of the lips close to the gums, 9 lines; lower part of the forehead, 10 lines; back part of the heel, 10 lines; back of the hand, 14 lines. The exact nature of these measurements may perhaps be understood by explaining one of them thus:—when the compasses were opened so that the points were 2 lines (rather more than $\frac{1}{4}$ th of an inch) apart, and then applied to the red part of the lips, two sensations were distinctly felt, due to the two points, and the direction in which the two points were placed with regard to each other, whether vertical, horizontal or oblique, was also appreciable; but when the distance was less than this, the two points seemed to produce but one impression, and the opening between them was not appreciable. Weber's table embraces all varieties from half a line to thirty lines, showing the great diversity in the relative sensibility to touch in different parts of the body.

Some very curious general remarks are adduced in support of the fact here stated. If the points of the compasses, distant from each other one or two lines, be applied to the cheek just before the ear, and be then moved successively to several parts of the cheek, we shall find on approaching the angle of the mouth that the points will appear to recede from each other; this is produced by the great difference of tactile power in these parts. This may be illustrated without the aid of the compasses, thus:—if we hold together the extremities of the thumb and fore finger, and then pass the tips of both in a line from the ear to either the upper or the under lip, they will feel to the cheek as if they were becoming more and more distant from each other. This is explicable on the assumption, that the more sensitive portions of the skin regard any two points as farther asunder, than equidistant points appear to be to a less sensitive portion.

Weber mentions the following fact. If the legs of the compasses be applied to two contiguous surfaces, enjoying the functions of voluntary motion, they will appear to be much more distant from each other than when they are applied to one of these surfaces separately: thus, if the points are distant half a line, they are not perceived to be distant when applied to one lip; but,

when one point is applied to the under lip and the other to the upper, they are at once felt to be two. An extension of the same property is observable in another circumstance to which he draws attention. Apply the legs of the compasses to two portions of the skin differing from each other remarkably either in structure, in function, or in the use habitually made of them; and the points will appear to be more clearly and distinctly felt than when they are applied to one and the same surface, even though it be the more sensitive of the two: thus the points, when in contact, the one with the inner surface and the other with the red outer surface of the lips, appear much more distant from each other than when they are in contact with the red surface only, although this has much greater tactile power than the inner surface.

The experiments of Weber brought conviction to his mind that the most sensitive parts of the skin, under the usual acceptance of the term, are not the most delicate in appreciating touch, as tested by his means; for instance, those parts of the body, such as the soles of the feet, which are much and painfully excited by tickling, are not those in which the delicacy of touch, for the common purposes of life, is most highly developed. On this point Dr. Graves observes:—"The reason of the matter is sufficiently obvious; for parts endowed with the greatest tactile acumen are necessarily much exposed, being so placed as to be brought with the greatest facility into contact with external bodies; consequently, if so disagreeable a sensation as that arising from tickling were easily induced by this contact, those parts would be almost useless as organs of touch."

BOOKS, AND THE READING PUBLIC.

A Sketch from the German of

WILHELM HAUFF.

I. THE CIRCULATING LIBRARY.

WHEN I resided at N——, it was one of my forenoon amusements to frequent a circulating library; not for the purpose of selecting books—though the collection amounted to between four and five thousand,—for I had, two years before, when suffering from a long illness, turned over the leaves of the greater portion of them,—but in order to observe what books were chosen by the public. At that time I had in my head the strange idea of writing a book; I had, however, no definite object or aim, and was very undecided after what great master I should model my first attempt; I confess I thought of the intrinsic value of the *work to be*, with rather an uncomfortable sort of sensation, for among all my ideas, I had not hit on one which (even printed in the best type,) seemed at all remarkable or striking.

One thing, however, struck me as being absolutely requisite for every one who wished to make a book—namely, that they should study man. Not a knowledge of them which may be learned now-a-days from books, but a study ought to be made of books themselves, so that it might be known what kind were most sought after and read with the greatest pleasure. *Vox populi, vox Dei*, thought I, may be true likewise here. Thus for many mornings I sat in the library, studying the readers and their varied tastes.

The librarian was a little old man, who, during the ten years I had lived in his neighbourhood, invariably wore an apple-green coat, a yellow vest, with blue nether garments. I endeavoured to convince him, that he could not have chosen a more glaring and tasteless dress, but, after I had made a few remarks quite to the point from the theory of colour, he burst into tears, and assured me, that in this fashion and in no other he

would dress all the days of his life; for of these colours had been his marriage dress, which six weeks before his wedding had been made; alas! too soon, for the bride died of a nervous fever before the appointed day. In his peculiar line the librarian was a man of much experience and told many interesting incidents. "In the morning,"—said he to me, for example,—"in the morning a great many books are exchanged, for then the second and third parts are asked for. This is not, as I first imagined, because at that time the servants come into town, for were this the case it would hold good likewise with the first volume. No, it comes from night reading."

"From night reading?" I said, astonished.

"I mean by that, that people read interesting books at night. A great number of persons (the young and healthy excepted) cannot fall asleep the moment they go to bed. It is a bad thing to take opium, for when once begun, the practice must be continued; there is then no better method than to read."

"I understand," replied I, "but you spoke of interesting books: are these the best for making people fall asleep?"

"Not all of them, the same books will not suit all. Of course we must make a distinction, and consider to whom this one would be interesting, to whom that one. You know Countess Wirknitz? well, she is one of the longest of being set asleep: I pity her waiting maid, who is obliged to read to her every night, sometimes till two in the morning. I once sent her in a mistake by the girl Gurre's *Germany and the Revolution*—(you are aware that to connoisseurs there can be nothing more interesting: eight nights long they read at it, yet only got over a hundred and ninety pages, for each night the Countess fell asleep at eleven o'clock. The waiting maid thanked me much for the 'sleepy book.' To give you another instance, who should come into my shop one day, to my great astonishment, but the old Professor Wanger, who pores over mathematics. For twenty years he had read nothing in the way of 'belles lettres,' save now and then the notices of deaths in the *Mercury*, and he had a wish to see what was in the meanwhile going on, to take a survey of any good works which might have appeared. I asked him whether he had read any of the works of Sir Walter Scott? He remembered of having heard of that celebrated man, and took away with him *Ivanhoe*:—*Ivanhoe*, that splendid story! The next day he came back, quite out of humour, threw down a few pence along with Scott on the table, and said, the stories of knights which he had read in his youth were far finer: he had actually fallen asleep over the first volume!—only think of falling asleep over *Ivanhoe*!"

"But what has this to do with what you were saying about second and third volumes?" I asked.

"You see, as we were speaking of interesting books it brought to my mind the Professor and the Countess. When an interesting book, however, falls into right hands, then all goes on as a horse at full speed. Suppose some one has been at a party or at the theatre, eaten a good supper, and then is preparing for bed. The lamp on the table at the side of the bed is then lighted, the waiting maid or valet, as the case may be, has put in its proper place a first volume, and all is in order, only sleep will not come. The lamp is drawn nearer, the book taken into the right hand, the left elbow supported by the pillow, and the title-page opened. The title suits the reader, and getting through the first, or, as I call it, the trying chapter; then it goes on like lightning, the eyes gallop over the lines, the pages fly, and a genuine night reader courses right through a volume without trouble in two hours. In general the first volume ends much in the same way as the closing scene of the first act in a drama. The spectator must wait in painful suspense for the next act. Discontented that the second volume is not at hand, yet pleasantly amused, the reader falls asleep; next morning his first glance falls on the book which he has perused, his curiosity is

excited about the hero, who at the conclusion of the first volume has either just been drowned, or has heard a strange knocking at the door, and just called 'Come in,' and, when I open my shop about eight o'clock, the Johannas, Fredericas, Catherines, and Babettes stand in crowds before the door, because the young lady before she takes her English lesson, the Captain of the horse before he rides out with the troops, the wife of the Privy Counsellor before she makes her toilet, would like to read a few chapters of the next volume of the most deeply interesting book."

II. TASTE OF THE PUBLIC.

"Oh, that I also were one of those happy ones!" thought I, as now, at the opening of the library, a medley of laced hats and pretty girls' faces presented themselves—"one of those happy ones, whose second volume is thus so much desired!" It was not without envy that I looked at the volumes, which the little librarian distributed with as much gravity as a baker would loaves in a time of scarcity. He had supplied the most urgent customers, had entered the money, or the price of reading, in his cash book, and I was now able to put an important question to him, which had long hovered on my lips, a question relative to the taste of the public.

"It is as various," replied he, "and often as singular, as the different tastes for eating. One likes sugar, another salt: one prefers salt water fish, oysters, and Italian fruits, whilst another will have nothing but nourishing household fare: yet in one point all are agreed, they all desire good viands."

"That is to say?"

"They wish to be entertained; every one to his liking."

"But where is the cook?" I exclaimed, "who can prepare the savoury morsels for these varied and spoiled palates? how can all or even many be supplied? yet in this lies the fame of the author!"

"They are not so spoiled as is believed," responded the librarian. "Fashion does much, and if writers would only diligently visit the circulating library, many a one would find what he is deficient in, or of what he has a superabundance. No one can become a good dramatist, who does not along with the spectators sit down and witness the representation of his own piece, carefully observing what produces the greatest effect."

The librarian was uttering my own thoughts; he expressed aloud what I had often whispered to myself. "Whoever wishes to know the spirit of the people must study the circulating libraries," he added, earnestly. "Only look at that long row of books; the white parchment backs are as clean as if they had never been touched, or touched only with gloves. Who do you think the author is who is thus neglected, and left to his repose?"

I guessed the works to be travels, or some history of nature.

"He never dealt at all in the last article," he answered, somewhat contemptuously; "no—it is Jean Paul."

"How!" I shouted, in amazement, "can a man who wrote for immortality, be already forgotten? does he not unite in himself all that is attractive and entertaining? deep earnestness and humour, tenderness and satire, sensibility and mirthfulness?"

"Who denies that?" said the little man. "He has united all in order to satisfy the most different tastes; he has minced every ingredient small enough, mixed them up wonderfully, and cooked them with a most piquant sauce: when ready, and the public had tasted, it was found to be very savoury, delicate,—but it did not agree with the stomach; none would relish his strong broth; his peculiar obscure style was unendurable. There stand all his dishes untouched, except when a few epicures in reading take now and then a 'Titan,' or a 'Rampanerthal' home with them, and taste delicacies which neither I nor my public understand. Do you see in that corner that other long row with the new green covers? that is Herder: there

also—but here comes a living example up the street: do you know Fräulein Rosa von Milben?"

"Certainly; I have met her several times, and found her a lady of the most refined taste, and who has read a great deal; somewhat sentimental and ideal, but withal of a most amiable ingenuousness."

"The young lady's waiting-maid will be here directly, and then you will have the best opportunity of becoming acquainted with the refined taste of that lady."

"I can easily imagine the kind of reading she prefers," I answered; "the Remains of Rosalie, or Jacob's Women's Mirror, Fiedge's Urania, or Agathocles by Caroline Pichler."

"Stand quietly on that side, we shall presently see."

I did as I was desired, took a book from the counter, and placed myself in a corner as if busily engaged in reading. The waiting maid entered the shop, gave a polite message from her young lady, and then asked whether No. 1629 was still not to be had?

"Not in yet," he replied, after a hasty glance at the book-shelves; "but here is another for your mistress; she will be much entertained with it." The girl went away.

"Quick, with a catalogue," I exclaimed, when the door had closed behind her; "let me see what No. 1629 is. With an ironical smile, the old man handed me the catalogue. I turned it over rapidly, and discovered, to my great surprise, that No. 1629 was—

by ———

"What! Does Fraulein Rosa, the amiable simple girl, read such a vulgar book as this (not to give it a worse name)?" I said, angrily. "Although no governess, no mother, regulated her reading, how can she permit herself to peruse such works? It must be a mistake,—the number has been written wrong."

"Worthy Sir," replied the librarian, "you think too well of people: here is a note which I took out of the small basket which the servant had—it is ——— and no other: *noscitur a socio*—by our companions are we known; look at the next of the numbers, and you will see for what kind of books the heart of the Fraulein sighs!"

I took the list in anger, on which was written in a delicate hand, for Fraulein von Milben, with a long array of numbers underneath. I began with the first, and found persons to whom, indeed, the vicinity of the old ——— was no disgrace. "What a hypocrite is this girl!" I exclaimed, "this is her reading, while I believed she would only read Hours of Devotion, and such like."

"Then, indeed, you must call a great many of our young ladies hypocrites, for ———, ———, and others of the same stamp, are their favourite writers; and you cannot call it hypocrisy if they do not speak of them."

"Why, in the name of heaven, should well educated people read books of which they cannot speak without a blush? Truly, intercourse with bad books is often more dangerous than intercourse with bad men."

"Why? do you ask why?" said the man of books, smiling, "because this is now the taste of the age."

III. THE GREAT UNKNOWN.

A domestic interrupted us. "The Countess of Langsdorf wishes a book," said he.

"What number?"

"The Countess did not say. But I think she would like a ghost story."

"Ghost story!" asked the little librarian, searching about: "will the story of a knight not do? The ghosts are all out."

"Yes,—only it must be something very awful; that pleases the Countess best," answered the servant, "let it be like the last one we had, 'The Dark Ruins; or, The Subterranean Dungeon,'—that pleased us very much."

"Did you also read it?" asked the little man, with surprise.

"Yes; after the Countess had finished a volume, we then read it in the servants' hall."

"Well; whether will you have 'The Castle Spirit,' 'The Resurrection from the Cavern of Death,' or, 'The Fiery Avenging Sword of Hildebrandt?'"

"It is difficult to choose," replied the servant. "What beautiful books these must be! I will take the 'Avenging Sword' now, but be sure and keep the 'Castle Spirit' for the next time."

Scarcely had the servant of the Countess who loved to read awful stories gone away, when a soldier with measured steps came in.

"For Lieutenant Plunkett of the 15th regiment, 'The Blinden Thorwart of Old Schott!'"

"Friend, did you hear aright?" asked the librarian; "The Blinden Thorwart of Old Schott? I know no author of this name."

"It is no auditor," answered the soldier of the 15th, "but a book. The Lieutenant is on guard and wishes to read."

"Well, but Old Schott!—there stands neither a young nor an old one in the catalogue."

"It is the same, I believe, of which so many have been printed, and which all the corporals and sergeants have bought for threepence."

"Walter Scott,"¹ cried the librarian, laughing; "and the book is called 'Quentin Durward!'"

"The very thing, that is it," said the soldier, "but I dare not ask the Lieutenant twice, or I should have known the name better; in consequence of giving the word of command, he has a most indistinct way of speaking."

He received his "Blinden Thorwart" and went away. But some good angel had sent him at that moment into the library, and a ray of light darted into my soul. "So, is it then true," said I, "that the works of this Briton are almost as widely spread as the Bible? that old and young, and even the lowest classes are delighted with them?"

"Quite true, it is calculated that in Germany alone there are circulated sixty thousand copies, and every day the works become more famed. In Scheerau there is established a manufactory for translations, where fifteen sheets are daily translated, and printed directly."

"How is this possible?"

"It certainly seems almost as impossible, as that this Walter Scott could have written such a number of books in so short a time: but so it is; for lately he has acknowledged himself to be the author. I have, however, myself, seen the manufactory at Scheerau."

"Perhaps by a division of labour they gain time?" I said.

"Just so," he replied, "and then, every thing is done mechanically. Professor Lux is at present occupied with inventing a steam-engine, which is to understand French, English, and German, and then there will be no longer any need of men."

"The manufactory is constructed in this manner:—"

"Behind in the yard stands the paper mill, which makes paper continually. This, dried, rolls forward towards the principal building, like a stream of lava, into the ground-floor; then, by the aid of machinery, it is cut into sheets and shoved under the press in the printing office. There are in all fifteen presses, which daily throw off 20,000 impressions. Close at hand are the drying places and those for the binding. We may therefore reckon that the half-liquid paper, which at five o'clock in the morning is still wet, makes by eleven o'clock the next day an elegant small volume—all this done in the space of thirty hours! In the first story are the arrangements for translation. We enter two rooms where fifteen men are at work. Every morning, at eight o'clock, half a sheet of Walter Scott is laid before them, which must be done by three o'clock in the afternoon. That is called there "working in the rough." Fifteen sheets in this way are translated every

morning. At three o'clock these men have a good dinner. At four o'clock, before each of them is laid down a printed half-sheet to be read over and corrected."

"But what is done with the sheets translated in the morning?"

"We shall see presently. In communication with the two large rooms are joined four small ones. In each of those small apartments there sits a composer, and his secretary: we call these persons composers or *stylists*, who look over the translations of the thirty, and change them from the rough into the fine; it is their department to improve the style. A composer gets two dollars a day, but must pay his secretary. Seven or eight rough workers are apportioned to each composer; and as soon as the former have finished a page it is sent to the latter. The composer sits with the English copy in his hand, while his secretary reads to him the translation, and amends here and there a sentence. In a fifth room are two makers of poetry, who put the mottoes at the heads of the different chapters into German, and any poems which may occur in the work."

I was amazed at this wonderful mechanism, and was only grieved to think that the thirty translators and the four *stylists* would lose their means of living, should Professor Lux succeed in his invention of the *translation engine*.

"Heaven only knows what will then happen," answered the little man; "even now the small volumes from the manufactory at Scheerau cost but a penny; in future two may be had for that, and every fourth day a volume will make its appearance!"

IV. VISIT TO THE BOOK SHOP.

My determination remained firm; "an historical romance à la Walter Scott, you must write," said I to myself, "for after all I have heard of the taste of the public, this, and nothing else will do." I confess, along with my resolution, came all manner of doubts. I should not only be obliged to read the works of this great man, but study them in order to attain my object. A third and greater doubt was, whether I should be able to find a publisher. I therefore resolved, before embarking in the work, to be more acquainted with the means made use of in such matters. The publisher, Salzer, might give me some information, I thought; so I sallied forth with two dollars in my pocket to buy a book, in the hope of making a nearer acquaintance with that gentleman.

"A handsome book for two dollars?" he asked. "What would you like? Poems?"

"Tales, or a romance, Sir," I said.

"At this price you will find nothing worth while," he replied, smiling. "But here is the catalogue."

"What! nothing good for two dollars, and yet a romance of Walter Scott's cost only twenty *groshen*."

"Oh, if you want translations, it is a different thing. I thought you wished an original work."

"Bless me," I exclaimed, "if a good romance from another language costs only twenty *groshen*, how comes it that our German books are so dear?"

"Do you imagine," answered he, in displeasure, "that we are to throw away originals at this contemptible price! These translations, these low prices, will ruin us soon enough without that. What has our fine trade of bookselling not already come to? Nothing but a sale by auction. Everything must be cheap, and thus everything is bad. In every corner of the land there is some one who deals in cheap clift goods, and we who resist this are brought to destruction."

"But how can this change in the trade exercise so great an influence on originals or on publishing?"

"How?" continued he, vehemently, "How? It is as clear as noon day; the public are in this way ruined and spoiled! I do not deny merit to Scott, or the two Americans; on the contrary, they are, alas, too good. But every sewing girl, for a couple of dollars,

(1) Old is either in German, on which it will be seen part of the joke depends.

can provide herself with a classical library of romances. The rage for this kind of fictions has spread unnaturally fast; and now, by means of these penny libraries, a hundred thousand people have obtained a standard by which they capriciously measure our German productions."

"So much the better for the world. Is not intelligence and good taste thereby spread abroad, while the reverse is set aside?"

"Intelligence and taste, produced by the little volumes at a few pence!" exclaimed Herr Salzer. "Oh, I know these fine words! Good taste! intelligence! as if only the people across the channel had good taste. Do you suppose people are intelligent, and have become wiser, because they all criticize, and say, 'This is not so beautiful as Walter Scott, or Cooper, nor that so profound and witty as Washington Irving?' What good can come to our literature or our book trade from such seed as this, which is so plentifully sown? Perversion of ideas, and some bad imitations (how I am ashamed to use such words), and above all, our ruin. Authors always desire an increase of payment; where one louis d'or has been paid, five are now asked, while, on the other hand, the books are less sought after than at first. Moreover, the fertility of this Sir Walter Scott has infected these gentlemen. They are now sparing of thoughts and prodigal of words. Thoughts, scenes, descriptions, which were suitable enough for one small volume, are now spun out, in order to fill ten or twelve, that more money may be obtained; and what was formerly given in four or five good verses, extends now throughout as many pages in rugged prose."

"Is poetry, then, likewise no longer in demand?"

"Who will buy it? Citizens! who look down with pride, and call everything verse-making. The learned! who obtain it from the author, that they may criticize it the more favourably. Librarians! who take only romances, as they know their public. These circulating libraries are our ruin. Every small town has a few of such establishments. The public think, why should they throw away so much money upon a book when it may be had to read from a circulating library? People purchase penny translations, or cheap pocket editions, so that they may have a library; and the bookseller who wishes to publish a work, can, at the most, only reckon on 500 circulating libraries. Were another Goethe or Schiller to be born in our day, we could not sell 500 copies of their works. The public has lost faith, confidence, and pleasure in our literature."

"And must Scott and the pocket editions bear the blame of all this?" I asked.

"Yes! and likewise of this wretched dilution, or scattering of talent everywhere! Authors split their talents into fragments to suit periodicals and annuals, because they are well paid for their articles. The public spend their money on these luxurious sort of wares, because it is the fashion; every one must have his magazine or his annual, and these pocket editions cancer and increase our sore."

"But, Mr. Salzer," said I, to the angry man, "why do you swim against the stream? Why do you not publish pocket editions yourself? Why do you not undertake a magazine? or are you ashamed to mix yourself up in such doings?"

"I need not be ashamed," answered he, after considering a little. "What another does, Salzer and Son may do likewise. But, to be candid, I fear I am too late with a magazine; and besides, whom could I get to write it! Anything new now-a-days must be striking and piquant to succeed. I have been thinking for some time, but in vain, of a distinguished title, for the title now must do everything. Had I only a few men skilled in the art, a critical review, or an artistic periodical might quickly make its appearance, for I have an enterprising spirit as well as others."

V. THE ENTERPRISING SPIRIT.

"We have now morning, noonday, evening, and midnight papers. We have exhausted the names of all the deities and muses; we are compelled to have recourse to the most singular designations if we would create a sensation. We must take care that the new sound overpowers that of the old accustomed one, though every sensible person sees that a new periodical is no better than an old one. Tales, poems, criticisms, are in the one as well as in the other, and good workmen cannot be invented along with the new name of the paper."

"But, Mr. Salzer, can you tell me why people often set aside a well-known and old established periodical for a few proof sheets of a newer one?"

"This is the peculiar feature of our times," answered he. "Change gives pleasure, and new brooms sweep clean; and the public is like a weather-cock, perpetually changing, yet knowing not why. Dress makes the man, and a fine vignette, a striking title, does as much in the reading world as a new fashion in an assembly. He who knows how to use this characteristic of men to advantage, may, even in our day, do something. Oh, that I had only a title!"

"As our periodicals must now be so many sided," said I, "what think you of the title, 'Literary food for Chickens?'"

"It is not amiss," he answered. "The public might be represented in the vignette as a flock of chickens, to whom the muses were distributing morsels of food; but no, I think that would not do; offence might be taken at the food, for it would look as if we wished to feed the public with the refuse of the great literary dinner. No, that will not do."

"Well, perhaps, the Evening Bell."

"Evening Bell? Certainly, it has a sound, and there is something soft and tranquillizing in it. I will consider of it; but there must be also a critical supplement. I wonder if it might not be called 'The Distiller.'"

"There is something good in your idea," I replied. "The works of modern times are assuredly criticised by a kind of chemical or distilling process; we distil so long that the strong spirit of which we are in search evaporates; or we distil until the learned alchemists are able to shew from what different essential parts the brewing is made; but the sheet would smell too much like a grocer's shop, or of strong waters. What say you to a 'Critical Chimney Sweeper?'"

The bookseller looked at me for a considerable time in silence, then embraced me in great emotion. "A discovery, an admirable discovery!" he exclaimed. "What does not this single word contain! Our literature is represented by the chimney, our reviewers are the chimney sweeps, who scrape off the literary soot, that the house may not take fire. It must be an opposition paper; it must create a sensation, for that is now the chief point. 'The Critical Chimney Sweeper!' We may give out the critical articles under the promising title of 'The Artistical Watchman!'" He hastily wrote down the name, and then continued—"Sir, you have been most opportunely brought to my shop. When I sit behind my desk, I am as it were nailed there; but I have often observed, that when I give expression to my thoughts, they come as in a flood. Thus, when you were speaking of the influence of Sir Walter Scott, there passed through my brain a splendid idea. I myself will make a German Walter Scott."

"What! will you also write a romance?"

"I? Oh no! I have something better to do; but, one did you say? No, twenty! If I could only arrange my ideas. I will produce a Great Unknown, and this shall be no other than a company of romance writers. Do you understand me?"

"It is not quite clear to me how you —"

"With money we can do anything," he rejoined. "I

procure seven or eight clever men, who have already done something in the way of writing romances, summon them here, and propose that they collectively shall represent Walter Scott. They will select the historical matter and the characters; they must determine what subordinate persons are to be introduced, and then —

"Oh! now I comprehend your great plan. You will, in fact, set up a manufactory, somewhat like the one at Scheerau. You will obtain drawings of all the romantic parts of Germany; the ancient costumes can be written for to Berlin; songs and legendary traditions you will find in the Boy's Wonderhorn, and other collections. You will establish some dozens of young persons in your house; the Sixfold Unity, the New Unknown, gives the outline of the romance—here and there he delineates and improves some great character; the other twenty-four or thirty write conversations, and describe towns, objects, and buildings, according to nature."

"Because," he joyfully interrupted me, "one has more talent for describing countries; another for describing costumes; a third, more for conversations; a fourth and a fifth, for what is comic; while another excels in what is tragic."

"Exactly! Thus the young artists are divided into landscape painters, costume tailors, conversation makers, comedians and tragedians, and the romance passes through all their hands, like pictures at Nürnberg, where one paints the sky, one the earth, another the roofs of the houses; where the first must paint the blue, the second the green, the third the red, the fourth the yellow, and so on, according to the order in which he stands."

"And unity and uniformity will be attained by this, precisely as in Walter Scott: where all the characters bear a strong family resemblance to each other; moreover, we shall get ready a pocket edition as *cheap as possible*; we may reckon upon forty thousand."

"And the title shall be 'The History of Germany from the earliest times to the year 1830,' in a hundred historical romances!"

Mr. Salzer shed tears of emotion. When he recovered a little, he warmly pressed my hand.

"Now, am I not as enterprising a spirit as any of them?" he asked. "What a sensation this will make! But you, my friend, were of assistance to me in bringing forth this magnificent idea; search out the best book in my shop, and, as a farther reward, you shall be—one of the twenty-four."

VI. CONCLUSION.

Thus, with little trouble, I was placed by my lucky fate where I had so long ardently wished to be. Now, there was no need for me to study either the people or their tastes in a circulating library. It was no longer necessary to search for a plan, for a work, nay, not even for suitable ideas; I had become a finger, a member of the new Great Unknown; I was to write according to my pleasure, and read my printed writings.

It is well known with what success the gigantic undertaking of Mr. Salzer went on; and it was, at length, no mystery to the world, of what essential parts the Great Unknown was composed. We were flattered that, at first, the works were ascribed to some celebrated and talented authors. For example, to Professor Lux, who, in the meantime, discovered his translating machine; to the poet Kempfer, and other such distinguished writers; indeed, even Willibald Alexis was suspected, notwithstanding his acknowledged dislike to German History. Every meritorious individual who formed a member of the company, has long since been named; therefore, it only remains for me to relate something of the share which I had in the enterprise.

As I happened to be tolerably well acquainted with some parts of Germany, I had, at first, assigned me a place among the scene painters. But, alas! I wrote (in the romance called "The Council of Constance," "light

and floatingly went the boat past the vine-clad hills between Basle and Constance." This passage having been looked over by the six directors, and printed, the reviewers and the public were astonished how the falls of the Rhine were passed; and immediately I was placed among the conversation makers. Conversations in inns, in market-places, and streets, were allotted to me. I continued at this until one of the sentimental and harpic speakers made a great mistake. He said—"The clouds came quickly forth, quickly behind the moon;" in vain was the authority of — cited, from whom this splendid passage had been copied: the words were pronounced to be nonsense, because the clouds never pass behind the moon; so it was set aside, and this particular post devolved on me. In this department I accomplished more than in both the others, as it formed the greater part of the romance called "The Dome of Aix-la-chapelle, or the Paladin of Charles the Great." I likewise wrote about twelve chapters in "Barbarossa, or the Lohenstraufen." My last work, before the dissolution of this undertaking, was the 8th, 9th, and 15th chapters in the "Battle of Künersdorf."

Much has been written both for and against this great enterprise, which I, as it by accident, called into life. When we consider that, in the brief space of two years, seventy-five volumes, or twenty-five romances, have been brought out at the manufactory of the Great German Unknown, we must, at least, be amazed at the diligence and patience of the partners. It has been urged as an objection, that some historical characters were quite misrepresented; that even great anachronisms were found; but, how trivial are such objections when compared to what has been otherwise accomplished by the company! Is not every scene so truly described, that it is easily seen it was not nature which was studied, but real pictures? Have we not had all the dresses of our heroes and heroines sent us from the most exact and particular theatres in Europe—particular, I mean, with regard to costume? Did not Mr. Salzer, at a great expense, purchase ancient furniture of all kinds, from old castles and armouries, in order to give us correct patterns?

Is not this historical truth and reality? And is not this what the public longs for? The true delineation of historical characters and epochs of history is only secondary to a proper description of dresses, shoes, chairs, houses, and such things, which, in the seventy-five volumes, will never be found incorrectly described. It has not been our fault that, during the last two years, this sort of writing has gone out of fashion. The splendid undertaking has been shipwrecked by the changeableness of the public. The whole affair originated in fashion; with a favourable wind we sailed down the stream of history, and our motto was, "Sooner let the truth of history be violated, rather draw a historical character wrong, than sin against the fashion of the times, or against the over-ruling taste of the public."

SCRAPS FROM SERGEANT TALFOURD'S VACATION RAMBLES.

THE CHURCH OF NOTRE DAME, AT PARIS.

"THROUGH such avenues we threaded our way, half blinded, and quite stunned, to the front of the venerable cathedral; an open space, indeed, but more resembling a filthy inn yard, than the approach to one of the most famous churches in Christendom, where every kind of filth was allowed to accumulate, and rubbish might be cast, not in secret, but under the great eye of heaven. Not a trace of reverential care gave token of Christian piety or antiquarian sentiment; but the poor old majestic pile, neighboured by dirty cafés and bankrupt-looking

shops, seemed left meekly to vindicate its claim of respect before heaven, like Christianity in its earliest days, rising above the scorn and the abuses of the world. I was disappointed in the size of the edifice, having received a shadowy notion of an enormous building, from Victor Hugo's great romance, of which it is the scene; but abundantly recompensed by the sense of dim antiquity which it conveys with more hoary power than any pile which I recollect, not in ruins. Its square grey turrets are the haunts of innumerable birds, former generations of whom have shivered away the crumbling stones for their posterity to 'make their bed and procreant cradle in,' and the low archways over the humble portals beneath them, seem carved out of wood which has been charred by the action of fire. The interior is naked and gloomy, and struck us with a vault-like chilliness. How different from the pride of Paris—the Madeleine, which we visited the next day, elevated on broad platforms of steps, a huge Grecian building of white stone, like an Athenian temple without, like a gaudy music-room within! The interior is still unfinished; but all glowing with purple and gold, without shadow, without repose, shows that in its perfection it will be a miracle of French art, raised to French glory. For such a gew-gaw as this, do the Parisians neglect their own holy cathedral; but no wonder; self is ever rebuked before the embodied presence of ages; Notre Dame is the grave of vanity, the Madeleine will be its throne."

VERSAILLES.

"Passing through some gaps in natural hedges, which English schoolboys might have made, we came in sight of the turrets and chimneys of the famous palace, and overlooked the groves which have shrouded so much pleasure, vanity, sorrow, and despair. Except the huge extent of building traced among the tall trees, there was nothing very striking in the scene; but what ghost-like recollections and fancies did it awaken! How slender compared to this, the voluptuous interest recognised by Pope in

'Clifeden's proud alcove,
The bower of wanton Shrewsbury and love?'

The form of Marie Antoinette haunts these groves and makes them sacred; I say 'the form,' because it is her beauty, real or imputed, which weaves the spell, and moulds her misfortunes into images of grace. How shallow and false is the notion that personal beauty is a frail and fleeting thing! It triumphs over wisdom and virtue, not only in life, but in death; redeems or veils folly and crime; and sweetens the saddest passages of history!"

FRENCH CHILDREN.

"I observed some French children: the very small ones, fantastically dressed up as playthings, seemed petted, caressed, and spoiled; but the elder ones, from ten to sixteen, looking careworn, conceited, independent, and miserable. Everything is gay in Paris but childhood. Old age is gay—pleasantly so even when fantastically so—and death itself is tricked out in garlands, and 'turned to favour and to prettiness.' Why then are the children so joyless? It cannot be that they are too harshly restrained, or ruled by fear; for a cruel discipline is no part of the French character, or the French educational practice; on the contrary, a French boy soon becomes his own master, and studies or lounges as he pleases. Is it not that there are no fireades, no homes? It seems a fine independent thing for a Parisian shopkeeper to dispense with the plague of domestic servants, take every day, with his wife, the freedom of the restaurant and the café, and, when he shuts up his shop, leave it to take care of itself, while he lounges, or dances, or smokes, or reads a journal, or does all these in some public garden; or, better than all, goes to the play. But the pleasures and comforts of children are of home growth, and require a home shelter. They are here

only sad, wearied, wandering spectators of the gaieties of their parents, which are all associated with coquetry, gallantry, and feelings akin to these, in which they do not participate; and though some amends is made by an early initiation into their essences, and an early emulation of their symbols, still children, as children, have no food for their affections in the whirling kaleidoscope which dazzles them. In Prussia, children are happier, because they are under a stricter discipline; but England, with all its imputed sins of flogging and flogging, and excess of Latin versification, is the place where childhood is most happy as childhood; happy in restraint; happy in indulgence; happy in the habits of obedience, and respect, and filial love! You would not find such a set of careworn, pale, unhappy faces in any charity school in England, as you may mark in a throng of wandering, dissipated boys, in the gardens of the Tuilleries."

THE LAKE OF BRIENZ.

"A few minutes of this hard work brought us into the still waters of the lake; we curved gently round to the right shore, and glided for some miles beneath a lofty bank, alternately rock and coppice, but not very striking, nor more beautiful than such a bank must be. If, however, the bank itself had no peculiar charms, its perfect reflection in the rippleless water afforded us delight as unbroken as the surface of the lake which mirrored it, like a delicious vision of familiar and beloved things. Why is this? Why does the reflection of a common object—a little boat with its one rude steerer, a low cottage, a gaunt poplar, a small nest of low bushes—possess a charm unshared by the reality? Is this only admiration of the dreaming softness which the mirror itself lends? Or does the spell work gently among the deeper elements of our own complex being; among the habits of thought which compel us to prefer the 'sweet and cunning' imitations of things even to things themselves; make the indifferent in reality interesting in picture, and bid us then do homage to these most perfect of pictures, which are pictures still? in the longing to cast off the bondage of the flesh, and transform the real to a dream? in the wish to dissolve the palpable in the ethereal, and yet to find in the ethereal images of all we love in the actual? Certain it is, that in the contemplation of these fairy pictures of nature, there is a peculiar, placid, home-felt delight; and that in looking into the downward sky which thus stretches out beneath us, we seem to look into the lowest depths of our own hearts, and find the untroubled serenity there, which answers to the sky of our highest aim, and confirms our airiest and purest hopes."

POETRY OF TENNYSON.

"I forthwith dived to the bottom of my bag, and eviscerated the first volume of 'Tennyson's Poems,' which, strange to confess, I had never read before, having been deterred by a most villainous prejudice, adopted from some 'false fleeting' criticism which represented them as replete with poetic power, but wild, irregular, and affected; which I translated into meaning something you are bound to admire, and compelled to dislike. I was therefore no less astonished than delighted with the passionate beauty, the intensity of generous pathos, the felicitous expression of a weight of human experience in few words, which, while they charmed, smote me with remorse for my long neglect of a great, original, deep-hearted poet. And yet it seemed almost impossible to believe that some of the poems were new to me. With so singular a felicity did they touch on some chords of feeling and memory, that they seemed old but strangely-forgotten things—strains heard in remote boyhood,—voices breathed with mighty, but homely power, from the depths of years. It seemed to me, as I read, as if I knew what was coming next, as our real life sometimes seems to break on the fragments of a reviving dream,—yet how far beyond all my poor

conceptions was the grace and glory with which fragments of my own being seemed invested!"

THE OLD COURT HOUSE OF SPLUGEN.

"There was something to me peculiarly affecting in this wreck of humble power: it touched at least a new modification of the feelings with which we regard the remains of old time, which violence has battered, and nature has rendered lovely. From visions of knightly banquets, desperate defences, regal sufferings, which the silent dignity of the 'child of loud-throated war' revives, it is pleasant for once to muse over the vestiges of common men who made an attempt at perpetual succession—to feel the spirit of antiquity hallowing the poor remains of a place where authority, ever needed by man, once held its narrow sway—perhaps not less revered by the old or less feared by the young, than the wisdom which grew immortal in codes, or the power which was terrible in blood. Here, at all events, in old time, was humanity struggling for a date beyond the span of individual life—the ambition, the pride, the vanity of civic power, and here is dust, silence,—and, therefore, interest for the human heart."

FALSEHOOD OF THE SENTIMENT THAT THE FEELING OF CREATIVE POWER PREDOMINATES IN WILD SCENERY, RATHER THAN IN THE HARMONIES OF NATURE.

"In the deep solitude of this our most Alpine hour, I felt my mind, instead of expanding with the scene, shrink and shiver within me; the awful description of Coleridge's Ancient Mariner,—of his feeling in the enchanted ocean—"so lonely 'twas that God himself scarce seemed there to be," came upon my thought; and I was forced to project my mind into brighter scenes, to cast off the 'burthen of mystery' with which these huge forms of matter oppressed it. Surely it is a false application of a great sentiment to represent that, amidst the vast desolation of scenes like these, the presence of creative and providential goodness is more vividly indicated than in the common pathway of life; that an unhumiliated spirit, finding Divinity nowhere else, must recognise it in these dumb fastnesses of nature; or that the devout believer should feel himself more in the immediate presence of his Maker here than in the plain or the city. Such raptures—if not misplaced at the sight of a vast chaos, like the cataract of Niagara, a world of water inevitably tumbling down from the sudden descent of its channel,—have no especial or peculiar propriety which should exclude equal consciousness of the Divine in holier scenes. Surely it is not beneath the pinnacle of heights unvisited by human steps; in huge unpeopled solitudes; in regions of ancient ruin and present desolation, that the mind more intensely perceives the workings of merciful Wisdom, than in the daily sunrise, the unfailing succession of seasons, the development of the humblest flower from its seed; the smallest, faintest, commonest harmony of the universe. It is true that when the mind, at first overwhelmed by those huge inequalities which mark the ruins of centuries, finds relief in tracing out the beauty which everywhere gradually cleaves to them, and perceives a spirit of loveliness ever working to clothe rude chasms with waving verdure, and sculpture out fair beds for the tortured torrents to rest in, it throws off the weight of stifling matter, and rejoices in its celestial relations. But there is more kindred with our heavenward thoughts, and, therefore, more living proofs of their divine source, in the humblest movement of the lowest intellect—in the infant's dawning smile—even in the instincts of animal affection, than in all these majestic tonings of the mind of the outer world. Within ourselves we may find the unerring witness to Him who moulded us, if we devoutly regard the depths of our own being; instead of being taught the cold lesson to 'look through nature up to nature's God,' strive to look out upon nature from Him; and rise towards heaven on the wings of faith and love, instead of trying to

ascend by the ladder of natural history. If the proud philosopher who has crushed the sense of Deity beneath his selfishness and his scorn, finds it rising upon him in scenes like these, it is not because they supply suggestions with which every movement of his own mind, if wisely scanned, is more pregnant; but because here—alone in a tempest-riven wilderness of rock—the truth starts out upon him, and the depth of the solitude forces him to confess that Presence which alone peoples it."

MONUMENT TO THE FRENCH GUARDS AT LUCERNE.

"We went early the next morning to see the monument to the Swiss Guards who were cut to pieces in August 1792, defending the royal family of France from the maddened republicans, the lion of Lucerne and of the world. Although the situation is chosen with a noble daring, the open side of a bare rock, surmounting a still pool of dark water; and the circumstance of the sole figure being sculptured out of that rock, arrests the attention of the spectator; yet situation, circumstance, material, all are nothing compared with the expression of the figure itself—the stricken and dying lion, grasping with its paw, as by instinct, more affecting as it has almost waned to mechanical, the lily of the Bourbons. There is surely no image in stone or marble of stricken power and beautiful resignation—of fidelity imparting sweetness to death—of true heroic suffering, beyond relief, yet above despair, so eloquent as this. We should say that it is superior to the occasion which prompted it, if such a work of genius were not truer than our theories. If I had not seen that patient and dying lion, I should have thought that, although no form of humanity that has mastered the fear of death, can ever be without kindred with the heroic, its lowest attributes would suffice for mercenary soldiers, yielding up their lives in pursuance of their bargain with a foreign power; but in the presence of this eloquent testimonial to the dead, I cannot help attributing to them some sympathy with the ancient greatness of the monarchy in whose service they fell, investing their valour with a moral dignity, and their fate with a human interest, which no written history could give them."

THEATRE OF MANHEIM.

"The house itself excited recollections of some of the greatest dramas ever acted; and of the career of the loftiest and purest of all dramatists who have ever lived—Schiller, whose first, and many of whose best plays, were produced in this narrow sphere. Here, in this small circle, his first, 'The Robbers,' flashed upon the heart of Germany. Was it possible to stand among the crowd of that pit, and not to thrill with the thought of the wonder, the enthusiasm, the intellectual joy of that great hour? True, it was radiant with the triumphs of the production of early youth—of excited, perturbed, undirected youth, but of a youth whose first 'wild and whirling words' were capable of startling the severe constancy of the wisest, and shaking the selfishness of the world. What must have been the sensation of a German audience, on the first representation of a work then warm from its author's heart, and first presented to the hearts of others, the perusal of which forms an era in the mental history of a thinker like Hazlitt, of a philosopher and poet like Coleridge? What must have been the delight of its author, not long emancipated from the severities of a military education, to find his burning thoughts thus reflected back again from the minds of his countrymen? And what must have been the gift of self-regulation, the heroic power of his spirit, which, unseduced by such triumphs, should so soon seek its approval, by more just and harmonious conceptions, from the severest wisdom?"

SIR FRANCIS HEAD'S CENSURE OF ENGLISH SCHOOLS.

"Seeking enjoyment for part of the time in continuing the perusal of Head's delightful work ('Bubbles from the Brunnens of Nassau'), imbued with additional interest

by the neighbourhood of the scenes he so charmingly delineates, I was surprised and grieved to peruse his elaborate attack on classical learning as the chief object of education at our great English schools, and on the studies of the university which follows it. The pretty exhibition of a school at the scene of the 'Serpent's Bath,' a name of odious fascination, seems to have awakened in his accomplished mind an admiration for the Nassau system, at the expense of our own, which I lamented in proportion to my respect for our accuser. I was the less prepared for his enthusiasm of invective, because in an earlier part of his work he had expatiated with pride, so graceful in his assumed character of an old man, on the symbols of moral and intellectual nobleness presented in the appearance of a party of young English Collegians, specimens of the operation of the system which he deprecates, in comparison with that of their fellow-voyagers, who have been fashioned under that which he prefers.¹ Indeed, after having inveighed against the whole tenor of classical scholastic education, he admits, 'that in spite of all its disadvantages, a set of high-minded, noble-spirited young men, eventually become an honour to their country.' But asserts, that 'this is no proof that their early education had not done all in its power to prevent them.' I do not understand what other proof can be required or given, or why, while the fact exists, any apprehension should be entertained of the advance of other classes of society in branches of knowledge now within their sphere of opportunity, and the scope of their actual use. If, indeed, classical instruction taught no more than an intimate acquaintance with the dead languages, and a fine perception of the beauties of the greatest works of ancient genius, surely such results could not follow the devotion of a large portion of studious boyhood to its labours. It is not for these accomplishments chiefly, that it is selected for the first place in education; it is because experience has shown it to afford the best means of training the young mind to patient, continuous, unruffled habits of toil; because the study of words, especially of exquisite words, is the best introduction to the knowledge of things; because it does not in the first instance apply to the faculty of unripe reason, which is better developed and strengthened, when it can be exercised on knowledge already mastered, than when incited to try its unfledged energies amidst 'worlds not realized,' but to strengthen the memory, to refine the taste, and to form the habit of cheerful and obedient toil. It is because the knowledge it communicates is not what is called 'useful,' because it does not supply the scholar with some information at once to be brought into productive exercise, of which he may be 'justly vain,' and with which he may rest contented, that it is wisely presented as a succession of difficulties to be surmounted by years of study, though cheered on the way by glimpses of the beautiful and sublime, disturbed by no controversial strifes, but giving to the labours of boyhood a harmony and a substance, and teaching at the same time that there are higher and nobler things in life to be cherished than those which tend to its outward convenience and enrichment; nay, that there are things compared to which life itself, with all its utilities, is worthless. Our English classic (for such unquestionably the author is), laments his own lot, as having left a classical school at the age of fourteen, 'scarcely knowing the name of a single river in the new world, tired almost to death of the history of the Ilissus. In after life (he continues) I entered a river

of America more than five times as broad as from Dover to Calais; and with respect to the Ilissus, which had received in my mind such distorted importance, I will only say, that I have repeatedly walked across it in about twenty seconds without wetting my ankles.' Surely our accomplished author recognises a strange scale by which to estimate the value of a knowledge of rivers in the opening or matured mind! While he probably owes much, however unconsciously, of that graceful spirit which bubbles up in his style as sparklingly as the fountains he celebrates, to his researches, bordering on the Ilissus, it is difficult to sympathize with his distress in not having learned the names of all the American rivers. Of what earthly use would it be to any English gentleman to know them all as familiarly as Mrs. Malaprop her 'parts of speech'? If he visits a river in America, the name of which he happens not to know, he will learn it in a minute from the first backwoodsman who will honour him with a civil answer; and if he stays at home, what interest has he in the name of a river he will never see, though it should be five times as broad as the sea between Dover and Calais, and should lose in its breadth all the attributes which give to rivers a place in our recollection or fancy? It would be a vast addition to his knowledge to know all the names of all the inhabitants of London and Westminster, with the numbers of their houses, as authentically collected and alphabetically arranged in the Post Office Directory—information likely to be far more convenient than the recollection of all the names of all the rivers in the new world. But would it be wise, therefore, to fill the memory with such a nomenclature rather than with the names of the heroes of the Trojan war, which are indexes to heroic deeds? To know that there are rivers in America one hundred miles in breadth may be well for one whose imagination has power to embrace such a waste of water; but beyond that "great fact" what blessing does a nominal acquaintance confer, unless the names are themselves pictures, as 'Abana and Pharpar lucid streams'? If the value of an unseen river to the mind depends on its breadth, Sir Francis Head would prefer by ten-thousand-fold the St. Lawrence to the Jordans which he might have passed with as dry, though not so contemptuous a foot as the Ilissus; and he may strike the balance of the interest, according to gallons of water, between the muddy flood of the Mississippi and 'Siloa's brook, that flowed fast by the oracle of God.'"

A CHURCH ANTIQUARIAN.

BROWNE WILLIS, the first person who undertook a detailed and general survey of the English Cathedrals, acquired his love for this pursuit by passing many of his idle hours in the Abbey when a Westminster boy. That Abbey was open to the boys till of late years, when they were deprived of a liberty which produced some injury to the monuments, and some annoyance to the visitors and showmen. Browne Willis, who became one of the oddest of old men, had his share of peculiarities as a boy. The monuments were his books, and before he left school he imbibed there a love of churches and church antiquities, which fixed the bent of his after life; he was a great repairer of churches and steeples, attended cathedrals and churches, whenever he could so time his visits, upon their dedication days; and when he went to Bath, would lodge nowhere but in the Abbey-house. A lively lady described him as having, with one of the honestest hearts in the world, one of the oddest heads that ever dropped from the moon. He wrote the worst hand of any man in England, it was more unintelligible than if he had learned to write by copying the inscriptions upon old tomb-stones; he wore three or four coats at once, each being of a different generation, and over

(1) "As we proceeded up the Rhine there issued from one of the old romantic castles we were passing, a party of young English lads, whose appearance (as soon as they came on board) did ample justice to their country, and comparing them while they walked the deck with the rest of their fellow-prisoners, I could not help fancying that I saw a determination in their step, a latent character in their attitudes, and a vigour in their young frames, which being interpreted, said—

"We dare do all that may become a man,
Who dares do more is none."

them an old blue cloak lined with fustian, all of which were girt with a leathern belt, giving him the appearance of a beggar, for which he was often taken in the course of his enthusiastic wanderings. His weather-beaten wig was of a colour for which language affords no name; his slouched hat, having past the stage between black and brown, was in the same predicament as the wig, and the lower parts of his equipment had obtained for him in his own neighbourhood, the appellation of Old Wrinkle Boots, for during the wear and tear and repair of forty years, the said boots had contracted as many wrinkles as their quantum of calf-skin would contain, and consequently did not reach half way up the legs which they once covered. Being far too deeply engaged with past ages to bestow any portion of his thoughts and cares upon the present, he suffered a fair fortune to be deteriorated by neglecting his worldly affairs; and having lived long enough to hold a distinguished place among antiquaries himself, he left behind him the character of a diligent and faithful antiquary, in which he will long continue to be remembered. Reputations of this class are not like those of fashionable authors, who "come like shadows and so depart;" they keep their place and make up in duration for what they want in extensiveness.—*Quarterly Review*.

A LOST CHILD.

A FEW years ago, in the parish of Sydney, in the province of New Brunswick, America, the following circumstance occurred:—

A young gentleman who had been out for some days on a hunting or shooting expedition, reached the banks of Bear Creek, which he was desirous of crossing, being anxious to make his way home before night-fall. To his disappointment, the log-bridge which he had passed the day before had been carried away by the current, which happened to be very strong in that place. Remembering, however, having noticed a fallen tree across the stream lower down, he pursued his way. Just as he had reached the spot, and was preparing to cross over, his ear was attracted by the sound of footsteps upon the dry sticks; the sound was accompanied by a cautious rustling movement among the thicket of wild raspberries that covered the opposite space. With the alertness of a sportsman, anticipating a shot at a deer or bear, his finger rapidly found its way to the lock of his rifle; and while his keen eye was warily fixed on the bushes, a slight attenuated hand, stained purple with the juice of the berries, was quietly raised to reach down a loaded branch of fruit; another instant, and the fatal ball had been lodged in the heart of the unconscious victim. A cry of terror and of thankfulness burst from the lips of the hunter as he sprang with eager haste across the stream and approached the child. It was a little girl, apparently not more than eight years old: her torn garments, soiled hands, dishevelled locks, and haggard face, betrayed the fact that she had strayed from the forest path, and been lost in the trackless wilderness. The child appeared overjoyed at the sight of the stranger, and told her artless tale with a clearness and simplicity that drew tears from the eyes of her preserver, who felt, indeed, as if he had been an instrument in the Divine hand, sent to rescue the forlorn being before him from a melancholy and painful death. Had not the loss of the bridge led him to seek another spot whereby to gain the opposite bank, she would in all probability have perished in that lonely spot;

but it was ordered otherwise, and the heart of the young man was filled with grateful emotion. He learned from the child that she had been sent by her mother to carry a basket of food to her father, who was chopping in the wood near the house; but that, by some mischance, she had strayed from the path, and, misled by the echo of her father's axe, she had wandered away in an opposite direction. Every attempt to retrace her steps only led her deeper and deeper into the wood; but still she went on. At first, she said, she cried a great deal; but finding her tears and lamentations brought no relief, she consoled herself with eating some of the food she had brought with her. When night came on, she was overcome with weariness, and lay down to sleep in a sheltered place, and rose with the first sound of the birds to pursue her hopeless way. When she had exhausted her provisions in the basket, she beguiled her sorrows by seeking for herbs, and berries. Fortunately it was the season of summer fruits, or else the poor wanderer must have perished. On the third night she lay down to sleep, and heard, as she supposed, the tread of cattle near her. She said she was very glad, for she thought the dark creatures she saw moving about in the dim light must be her father's oxen; and she called to them very often, "Buck, Bright!" but they did not come nearer; and she wondered she did not hear the ox-bell. Another night she said she saw two great black shaggy dogs, which she thought were neighbour Hewet's dogs; but when she called them by their names, they stood up on their hind legs, and looked hard at her, but did not come near her, and soon went away into the wood: and she knew they were dogs, for that night she heard them howling. In all probability these animals were bears, for the woods abounded with those animals, and the stream the hunter had crossed bore the name of Bear Creek; the howling, most probably, arose from wolves; but her innocent heart knew no fear. The day after this she found herself near a deserted shanty; the clearing on which it stood was overgrown with strawberries and raspberry-bushes; and here she remained, picking the berries, and sleeping beneath its sheltering roof at night. She led the hunter to her solitary hut, where he proposed leaving her whilst he went in search of help to convey her home, or to some dwelling house; but the little creature clung to him with passionate weeping, and implored him so pathetically not to leave her again alone in the dark lonely forest, that his heart was not proof against her entreaties; and, though weary with his own wandering, he took the little foundling on his back and proceeded on his journey, occasionally resting on the fallen timbers to ease him of his burden. The shades of night were closing in fast upon them; and the weary pair were making up their minds to pass another night under the shade of the woods, when the sound of water and the working of mill-wheels broke upon their ears; and soon the light of the last glow of sunset broke through the trees in the distance; and the child, with a shout of joy, proclaimed they must be near a clearing at last, for she saw light through the stems of the trees. Gladly did the poor wayworn travellers hail the cheerful sight of the mill and the neat log-house beside it; and gladly did the kind inmates of the place receive and cherish the poor lost child, who had been sought for till hope had departed from the hearts of her sorrowing friends,

and she was reckoned among the dead. She had wandered away miles from her home, and been absent many days; but she had been supplied with water and fruits, and her spirits had been wonderfully sustained during her wanderings.

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

AN EPITAPH

IN THE CHURCH OF ROMFORD, ESSEX, ON THE DEATH OF THE RIGHT WORSHIPFUL SIR ANTHONY COOK, KNIGHT, WHO DIED THE 11TH DAY OF JUNE, 1576.

You learned men and syche as learning love
Vouchsafe to reade this rude unlearned verse
For stones are doombe and yet for mannes behove
God lends them tongues somtymes for to rehearse
Sych wordes of worth as worthiest wits may pearce
Yea stones (oftymes) when bloode and bones be rott
Do biase the brute which else might be forgott
And in that heape of carved stones doth lye
A worthy knight whose life in learninge ledd
Did make his name to mounte above the skie
With sacred skill unto a kinge he redd
Whose towarde youthe his famouse praises spredde
And he (therefore) to courtly lyfe was called
Who more desired in study to be stalled
Philosophy had taught his learned mynde
To stand content with countrye quyet lyfe
Wherein he dwelt as one that was asyned
To garde the same from sundry stormes of stryfe
And (but when persecuting rage was ryfe)
His helping hand did never fayle to stay
His countreyes staffe but held yet up alway
No high advance nor office of avails
Could temple his thoughts to soare beyond his reach
By bronte of books hee only did assayle
The forte of fame wherto hee made his breache
With tyre of truthe, which God's good worde dothe teach
The wealth he won was due to his degroe
He neyther rose by riche rewardes nor fee
And yet although he bare his sayles so lowe
That in his lyfe he did right well bestowe
His children all before their pryne was paste
And lincke them so as they be like to laste
What shoulde I say but only this in summe
Beatus sic qui timet Dominum
That only skill that learninge bears the bell
And of that skill I thoughte (poore stoon) to tell
That syche as like to use their learninge well
Might reade these lynes and herewith oft repeate
How here on earth his gyft from God is greate
Which can employe his learninge to the best
Soe did this knyghte which here with me doth rest.

"WHERE SHALL I TURN TO FORGET, AND BE AT PEACE?"

A. H. T.

Oh woman, when thy golden youth is gone,—
Swiftly hath died away,
As light from the sweet day,—
How shalt thou meet the night which cometh on?
When none shall heed thy voice,—no earthly friend
Shall whisper in thine ear,
Words thou wouldst die to hear—
"I love thee still the same, until the end;"—

Where shalt thou turn from the remembered past,
Through the dark years to come?
The heart must have a rest—
Something whereon to lean, even to the last.

A pitying voice shall tell thee, whispering low
To the still soul within;
"Only be pure from sin:
"What though of earthly joy thou canst not know?
"I feel thy grief—I have shed human tears,
I know thy sorrows well,
Better than thou canst tell,
I know the darkness of thy lonely years.
"Yet tremble not—though there be none beside,
Though the deep waters roll,
Over thy prostrate soul,
Thy God shall be thy stay—for thee He died."

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne*.

ANECDOTE OF SIR HENRY FANSHAW.

LADY FANSHAW relates to her son the following anecdote of his grandfather Sir Henry Fanshawe, who lived in Queen Elizabeth's reign.

He had great honour and generosity in his nature, and to show you a little part of which, I will tell you this of him. He had a horse that the then Earl of Exeter was much pleased with; and Sir Henry esteemed, because he deserved it. My Lord, after some apology, desired Sir Henry to let him have his horse, and he would give him what he would; he replied, "my lord, I have no thought of selling him, but to serve you; I bought him of such a person, and gave so much for him, and that shall be the price to you, as I paid, being sixty pieces;" my Lord Exeter said, "that's too much, but I will give you, Sir Henry, fifty;" to which he made no answer. Next day, my lord sent a gentleman with sixty pieces, Sir Henry made answer, "that was the price he paid, and once had offered him to my lord at, but not being accepted, his price now was eighty;" at the receiving of this answer, my Lord Exeter stormed, and sent his servant back with seventy pieces. Sir Henry said, "that since my lord would not take him at eighty pieces, he would not sell him under a hundred pieces, and if he returned with less he would not sell him at all;" upon which my Lord Exeter sent one hundred pieces and had the horse.

LORD ERSKINE'S FONDNESS FOR PUNNING.

In this forbidden ground, the region of puns, wit's lowest story, Erskine would disport himself with more than boyish glee. He fired off a double-barrel when encountering his friend, Mr. Maylem, at Ramsgate. The latter observed that his physician had ordered him not to bathe. "Oh then," said Erskine, "you are '*Malum prohibitum*.'" "My wife, however," resumed the other, "does bathe." "Oh, then," said Erskine, perfectly delighted, "she is '*Malum in se*.'"—(*Townsend's Lives of eminent Judges*.)

FRANK FAIRLEIGH,
OR, OLD COMPANIONS IN NEW SCENES.
By F. E. S.

CHAP. III.
THE BALL.

"By Jove! this is hot work!" exclaimed Lawless, flinging himself down on a sofa so violently, as to make an old lady, who occupied the farther end of it, jump to an extent which seriously disarranged an Anglo-Asiatic nondescript, believed by her to be a turban, wherewith she had adorned her aged head. "If I have not been going the pace like a brick for the last two hours, it's a pity: what a girl that Di Clapperton is to step out!

VOL. III.

splendid action she has, to be sure, and giving tongue all the time too. She's in first-rate training, 'pon my word; I thought she'd have sewn me up at one time--the pace was terrific. I must walk into old Coleman's champagne before I make a fresh start; when I've recovered my wind, and had a mouthful of hay and water, I'll have at her again, and dance till all's blue before I give in."

"My dear fellow," said I, "you must not dance all the evening with the same young lady; you'll have her brother call upon you the first thing to-morrow morning to know your intentions."

"He shall very soon learn them, as far as he is concerned, then," replied Lawless, doubling his fist. "Let me have him to myself for quiet twenty minutes, and

"I'll send him home with such a face on him, that his nearest relations will be puzzled to recognise him for the next month to come at least. But what do you really mean?"

"That it's not etiquette to go on dancing with one young lady the whole evening; you must ask some one else."

"Have all the bother to go over again, eh? what a treat! Well, we live and learn; it will require a few extra glasses of champagne to get the steam up to the necessary height, that's all. And there they are going down to supper; that's glorious!" and away he bounded to secure Miss Clapperton's arm, while I offered mine to the turbaned old lady, to compensate for her late alarm.

After supper the dancing was resumed with fresh energy, the champagne having produced its usual exhilarating effects upon the exhausted frames of the dancers. Notwithstanding my former repulse, I made a successful attempt to gain Miss Saville's hand for a quadrille, though I saw, or fancied I saw, the scowl on Mr. Vernon's sour countenance grow deeper, as I led her away. My perseverance was not rewarded by any very interesting results, for my partner, who was either distressingly shy, or acting under constraint of some kind, made monosyllabic replies to every remark I addressed to her, and appeared relieved when the termination of the set enabled her to rejoin her grim protector.

"Of all the disagreeable faces I ever saw, Mr. Vernon's is the most repulsive," said I to Coleman; "were I a believer in the power of the 'evil eye,' he is just the sort of looking person I should imagine would possess it. I am certain I have never met him before, and yet, strange to say, there is something which appears familiar to me in his expression, particularly when he frowns."

"He is a savage-looking old Guy," replied Freddy, "and bullies that sweet girl shockingly, I can see. I should feel the greatest satisfaction in punching his head for him, but I suppose it would be hardly the correct thing on so short an acquaintance, and in my father's own house too; eh?"

"Not exactly," replied I, turning away with a smile.

When Lawless made his appearance after supper, it was evident by his flushed face, and a slight unsteadiness in his manner of walking, that he had carried his intentions with regard to the champagne into effect; and, heedless of my warning, he proceeded to lay violent siege to Miss Clapperton, to induce her to waltz with him. I was watching them with some little amusement, for the struggle in the young lady's mind between her sense of the proper, and her desire to waltz with an Honourable, was very apparent, when I was requested by Mrs. Coleman to go in search of a cloak appertaining to the turbaned old lady, whom I had escorted down to supper, and who, being delicate in some way or other, required especial care in packing up. Owing to a trifling mistake of Mrs. Coleman's, (who had described a red worsted shawl as a blue cloth cloak, which mistake I had to discover and rectify,) my mission detained me some minutes. As I re-entered the ball-room, shawl in hand, I was startled by the crash of something heavy falling, followed by a shriek from several of the ladies at the upper end of the room; and on hastening to the scene of action, I soon perceived the cause of their alarm.

During my absence, Lawless, having succeeded in overcoming Miss Clapperton's scruples, had re-commenced waltzing with the greatest energy; but unfortunately, after going round the room once or twice, "the pace," as he called it, becoming faster at every turn, the combined effects of the champagne and the unaccustomed exercise rendered him exceedingly giddy, and just before I entered the room, he had fallen against a small table supporting a handsome China candelabrum, containing several wax lights, the overthrow of which had occasioned the grand crash I had heard. The cause of the shriek, however, still remained to be discovered, and a nearer approach instantly rendered it apparent. One

of the wax candles, which had not been extinguished in its fall, had rolled against the ball-dress of Miss Saville, who happened to be seated next the table, and set it on fire. After making an ineffectual attempt to put it out with her hands, she became alarmed, and as I approached, started wildly up, with the evident intention of rushing out of the room. Without a moment's hesitation, I sprang forward, caught her in my arms, and flinging the worsted shawl over her dress, which was just beginning to blaze, enveloped her in it, and telling her if she only remained quiet she would be perfectly safe, laid her on the floor, while I continued to hold the thick shawl tightly down, till, to my very great delight, I succeeded in extinguishing the flames.

By this time several gentlemen had gathered round us, eager with their advice and offers of assistance. Having satisfied myself that the danger was entirely over, I raised Miss Saville from the ground, and, making my way through the crowd, half led, half carried her to the nearest sofa. After placing her carefully upon it, I left her to the care of Mrs. Coleman and Lucy Markham, while I sought out the turbaned old lady, whose shawl I had so unceremoniously made use of, and succeeded in making my peace with her, though, I believe, in her own secret breast, she considered Miss Saville's safety dearly purchased at the expense of her favourite whittle. As I approached the sofa again, the following words, in the harsh tones of Mr. Vernon's voice, met my ear.

"I have ascertained our carriage is here; as soon, therefore, as you feel strong enough to walk, Clara, my dear, I should advise your accompanying me home; quiet and rest are the best remedies after such an alarm as this."

"I am quite ready, Sir," was the reply, in a faint tone of voice.

"Nay, wait a few minutes longer," said Lucy Markham, kindly; "you are trembling from head to foot even yet."

"Indeed I am quite strong; I have no doubt I can walk now," replied Miss Saville, attempting to rise, but sinking back again almost immediately from faintness.

"Can I be of any assistance?" inquired I, coming forward.

"I am obliged to you for the trouble you have already taken, Sir," answered Mr. Vernon, coldly, "but will not add to it. Miss Saville will be able to proceed with the assistance of my arm in a few minutes."

After a short pause the young lady again announced her readiness to depart; and, having shaken hands with Mrs. Coleman and Lucy Markham, turned to leave the room, leaning on Mr. Vernon's arm. As I was standing near the door, I stepped forward to hold it open for them, Mr. Vernon acknowledging my civility by the slightest imaginable motion of the head. Miss Saville, as she approached me, paused for a moment, as if about to speak, but, apparently relinquishing her intention, merely bowed, and passed on.

"Well, if it's in that sort of way people in modern society demonstrate their gratitude for having their lives saved, I must say I don't admire it," exclaimed Coleman, who had witnessed the cool behaviour of Mr. Vernon and his ward; "it may be very genteel, but, were I in your place, I should consider it unsatisfactory in the extreme, and allow the next inflammable young lady who might happen to attract a spark in my presence, to consume as she pleased, without interfering; and peace be to her ashes!"

"It was most fortunate that I happened to have that thick shawl in my hand," said I; "in another minute her whole dress would have been in a blaze, and it would have been next to impossible to save her. What courage and self-command she showed! she never attempted to move after I threw the shawl round her, till I told her all danger was over."

"Very grand, all that sort of thing," returned Freddy, "but for my own part I should like to see a little more feeling; I've no taste for your 'marble maidens;' they always put me in mind of Lot's wife."

"Eh! Mrs. Lot!" interrupted Lawless, coming up to us, "why was she like me? do you give it up? Because she got into a pretty pickle,—there's a riddle for you. I say, I made a nice mess of it just now, didn't I? that's what comes of going to these confounded balls. The fact was," he continued, sinking his voice, "the filly bolted with me; she took uncommon kindly to the champagne at supper; in consequence, she was so fresh when we started, that I couldn't hold her; she kept pushing on faster and faster, till at last she was fairly off with me; we did very well as long as we stuck to the open country, but we contrived to get among some very awkward fences; the first stiff bit of timber we came to she made a rush at, and down we came, gate—I mean, table, candlestick, and all, a regular smash, and to make matters worse, one of the candles set the other young woman's petticoat alight."

"In fact, after a very severe run, you were nearly being in at the death," suggested Coleman.

"By Jove, it was nothing to laugh at though," resumed Lawless; "she'd have been regularly cooked, if Frank Fairleigh hadn't put her out when he did, and I should have been tried for 'Unjustifiable Girl-seide,' or 'Maliciously setting fire to a Marriageable Female,' or some such thing; and I dare say the young woman wasn't insured anywhere; I should have got into a pretty mess; it would have been a worse job than breaking Shrimp."

"Frederick, look here!" cried Lucy Markham, who was passing the place where we stood; "see how Mr. Fairleigh's sleeve is scorched; surely," she continued, turning to me, "your arm must be injured."

"It begins to feel rather painful," replied I, "but I dare say it's nothing to signify."

"Come to my room," exclaimed Freddy, anxiously. "Why did you not mention it before?"

"Really I scarcely felt it in the excitement of the moment," returned I; "it can't be of any consequence."

On removing the coat-sleeve, however, a somewhat considerable burn was apparent, extending about half way from the wrist to the elbow, and which, the moment it was exposed to the air, became excessively painful.

Fortunately, amongst the guests who had not yet taken their departure, was the surgeon of the neighbourhood, who was speedily summoned, and who, after having applied the proper remedies, recommended me to carry my arm in a sling for a few days, at the end of which time, he assured me, it would cause me little inconvenience.

As it was, by great good luck, my left arm which was injured, I submitted to this mandate with tolerable resignation, and returned to the drawing-room to be pitied by the tongues of the old, and the bright eyes of the young ladies, to an extent which (as at that time of day I was somewhat addicted to the vice of shyness) was more flattering than agreeable.

It was between two and three o'clock when Lawless and I prepared to take our departure for the inn at which we were to sleep. Being a lovely night, Coleman volunteered to accompany us for the sake of the walk, telling the servants not to sit up for him, as he had a latch-key in his pocket, an article, regarding the possession of which, a constant civil war was carried on between his mother and himself, wherein by dint of sundry well-contrived stratagems, and deeply-laid schemes, he invariably gained the victory.

"I tell you what," said Lawless, "the row and bother, and the whole kick up altogether, has made me alarmingly hungry; the only decent bit of chicken I managed to lay hands on at supper, Di Clapperton ate; precious little that girl has, to be sure; even after all the ground she's been over to night, going a topping pace the whole time too, she wasn't a bit off her feed; didn't she walk into the ham sandwiches! that's all! I'd rather keep her for a week than a fortnight, I can tell you; she'd eat her head off in a month, and no mistake. Here, waiter," he continued, "have you got any thing to eat in the house?"

"Yes, Sir, splendid barrel of oysters down by coach

last night; capital brown stout, Sir, 'real Guinness!' "That's it, my man," was the rejoinder, "erot 'em out, by all means. Freddy, old boy," he continued, "come along in with us, and have some."

"Well, I don't mind astonishing the natives for once in a way," replied Freddy, "but it's dreadfully debauched, eating oysters and drinking porter at this time of day or night, whichever you are pleased to call it; you'll ruin my morale."

"The devil fly away with your morals," was the polite rejoinder; and in we all went together. The oysters and porter soon made their appearance, and had ample justice done them; then, as a matter of course, spirits and water and cigars were produced, "just to prevent the oysters from disagreeing with us;" and we sat talking over old times, and relating various adventures which had occurred to us since, without troubling our heads about the flight of minutes. At length Coleman, pulling out his watch, exclaimed, "Past four o'clock, by the powers! I must be getting to bed,—I've got a lease to draw to-morrow, and my head won't be over clear, as it is."

"Nonsense," replied Lawless, "bed's all a popular delusion; we can't be better off than we are—sit still;" but on Coleman's persisting in his wish to depart, Lawless continued,—"Well, take another glass, and then Frank and I will walk home with you, and see you safe, for it's my belief that you're getting 'screwed,' or you'd never think of going to bed." Freddy and I exchanged glances, for if any of our party were in the condition expressed by the mysterious word 'screwed,' it certainly was Lawless himself. After sitting some little time longer, we once more sallied forth, with the avowed intention of seeing Coleman home.

ORFORD CASTLE.

Amongst the thousands of tourists from south to north, in these times of extended intercourse between all parts of this beautiful island by steam navigation, who has not, whilst inhaling the bracing breeze and careering gaily over the "boundless and sublime," observed on the coast of Suffolk, between Harwich harbour and Aldeburgh, famous for being the birth-place of Crabbe, a castle rearing its proud front in broad relief against the western sky? Between those two light-houses, and at a short distance from that low, shingly, and barren shore denominated the Ness, broad, massive, stern, and grey stand the remains of Orford Castle, a mighty stronghold of feudal times, associated with the imperishable names of the Malet, the Bigod, the Despenser, and other "barons bold," who contributed to form the chivalrous host of the Norman conqueror.

Orford Castle stands upon a commanding eminence on the north-west side, or, in military phrase, on the right bank of the river Ore. By day, in clear weather, it serves as a land-mark for the mariner, and may be easily distinguished at the distance of twenty-five miles. A more interesting object is, perhaps, impossible to conceive, as you approach the coast, especially towards evening. In the far distance the eye rests upon the domain of the Marquis of Hertford, with its undulating wood-land; in the fore-ground, the lofty keep and weather-beaten turrets of the old castle, mel- lowed by the rich glow of sunset, proudly shadowing forth the crumbling glories of olden times.

The date at which this venerable castle was erected has long been a matter of anxious inquiry amongst topographers and antiquarians. No records exist; for in the "iron times" of which we write the barons and their retainers, being engaged almost exclusively in warlike pursuits, had no opportunities for cultivating

the arts of literature; indeed, literature had scarcely dawned when this kingdom was first dotted with fortresses and castles. The little learning known was confined exclusively to the cloister. The monks were engaged more in matters relating to the management of their respective monasteries, than in making records connected with the castles and fortresses erected to consolidate and perpetuate the sway of the conqueror. After most careful and elaborate research, we have little doubt that Orford Castle was built A.D. 1067-8. In the former year, the Conqueror received the submission of all the nobility who had not attended his coronation, at Barking, in Essex, and, confirming them in possession of their estates and dignities, took care, however, previously to visiting Normandy, to place all real power in the hands of his barons; the better to effect which he caused fortresses and citadels to be erected at various places best situated for commanding the kingdom. That Orford Castle was one of the strongholds then erected there can be little doubt, since its position was calculated to form a most powerful military station, commanding the country for many miles around, and under cover of which a most favourable point was presented for carrying on intercourse with the Conqueror's Norman dominions, as well as for debarking supplies and munitions of war. The opinion we have expressed is further strengthened by several historical facts. Upon the usurpation of the crown by Stephen, the barons, in return for their submission, demanded the right of fortifying their castles, and the whole of England was thereupon filled with fortresses, garrisoned with vassals and soldiers. The evils resulting from compliance with this demand were aggravated by the wars in which Stephen was engaged with the Empress Matilda. In 1155, however, Henry II., the better to strengthen his throne and to keep the refractory barons in order, caused all the newly-erected castles to be demolished, which, upon the authority of historians, had proved "so many sanctuaries for freebooters and rebels." In pursuance of this royal mandate, the castles of Ipswich, with the castle of Walton, about twenty miles from Orford, were razed to the ground; and in accordance also with stipulations, the stones being removed in each case to the distance of a mile, were scattered about, that they might not again be used for similar erections. The evidences of this still remain. The soil of Suffolk is gravel and chalk, with a staple of loam. In a part of the town of Ipswich, called "The Wash," which in olden times formed the bed of a deep stream of water, fordable at different points, but which now consists of a long and well-paved street, through which, however, a small stream still finds its way from Christ Church Park, and falls into the river Orwell, the stones of Ipswich Castle have been several times turned up during the last century by excavators, in digging wells and cellars; whilst a road, about a mile from the site of the Castle of Walton, has also presented the same evidences that Walton Castle shared the same fate. Now, in none of the histories of the period, nor indeed in any of the quaint narratives given by the early English chroniclers, do we find mention of any Castle of Orford having been made subject to the same mandate. Upon this negative evidence, then, we may reasonably conclude that Orford Castle, as it now stands, survived the general wreck; and that there are the best grounds for this, is shown also by the fact that Orford Castle was placed in the hands of those Norman nobles who were bound by their fealty to support the throne; though, as we shall see, there were one or two exceptions, in which cases the turbulent and disaffected were superseded by others more worthy of their sovereign's trust and confidence.

We now come to the important question—under whose immediate auspices was Orford Castle designed and completed? This is, again, a somewhat difficult point to solve. It is one that has puzzled every local historian. As we have observed before, no records exist.

It is probable that Orford Castle was erected by Robert Malet, and the evidence is strong in favour of the supposition. This Robert Malet was the son of William Malet, whose name appears on the roll of Battle Abbey as having been one of the victorious followers of the Norman invader. To him was consigned the body of Harold, found on the field of Hastings, with injunctions that the usual pious offices should be properly performed. The services rendered by William Malet appear to have met with ample reward at the hands of the Conqueror, in the person of Robert Malet, the son; for, after the fall of William Malet, in 1069, in defending York Castle, the command of which devolved upon him upon the death of Robert Fitz-Richard, the governor, the Conqueror granted to Robert Malet 267 manors in England, 221 of which, as Dugdale states, were situate in the county of Suffolk. In this grant was the manor of Sudborne, in which Orford was included. These princely possessions Robert Malet appears to have held for about thirty-three years. Under Henry I. he held the office of Great Chamberlain; but, deserting his post, he ranged himself under the banners of Robert Curthose, who laid claim to the throne. Upon the defeat of Curthose and his rebellious followers, Henry I. deprived Robert Malet of all his possessions, and being banished the realm, he passed over with Robert Curthose into Normandy; the name of Malet being thenceforth associated with the basest ingratitude for deserting the Crown in the greatest emergency in which his king could have been placed, thus forming a strong commentary upon the political morals of those times, though later periods of our history have not been less remarkable for similar examples.

Having given the above historical data, it may be interesting to attempt a minute description of the castle itself.

From the number of bricks and tiles turned up at various periods in the vicinity, there appears to be no doubt that the castle stood formerly in the centre of the town of Orford. That Orford was, in ancient times, a place of considerable magnitude, admits of no question. Enjoying the favour of successive sovereigns, and being under the immediate personal surveillance of powerful barons, Orford possessed many privileges. So early as the reign of Edward I. it sent two members to parliament; that privilege is now extinct. Down to the year 1500, Orford possessed three churches—but one now remains. Its maritime importance is evidenced by the fact, that in the reign of Edward III. the burgesses fitted out three ships of war, which they despatched to the siege of Calais; it possesses now but half-a-dozen small fishing boats. Five centuries since it possessed several streets; their sites are now either traversed by the plough or are depastured by oxen and kine. The thoroughfares, Bridge-street, Church-street, and Broad-street, which once echoed to the clank of armed men, and to the bugle sounded at the castle-gate by the "belted knight," now present to the spectator merely so many "green lanes," still retaining their ancient appellations, where lovers may ramble, or poets apostrophize the moon. The warlike baron and his trusty bands of retainers; the portly burgesses, proud of their royal charters; the stately ships, which rode gallantly on the broad and swelling bosom of the Ore; the busy population deep in trade and commerce; the handicraftsmen plodding to their daily toil; the stoled priest shriving the dying sinner, and waiving his last penitential sighs to heaven; the joys and sorrows, the hopes and fears, the crimes and virtues, the springs which gave impulse to human actions—all have been swept away; and the only memento now left of the glories of Orford is its noble castle, and all its proud recollections.

Upon yonder lofty mound, covered with the green herbage of summer, stands the keep with its "donjon"—nearly all that now remains of the once mighty stronghold of the Malet, the Bigod, and the Despenser. The

keep is a good specimen of the castellated style. It is ninety feet in altitude, and is built in the form of a polygon of eighteen sides, described within a circle whose radius is twenty-seven feet. Three square embattled towers flank it at equal distances on the west, north-east, and south sides, and by these towers the keep is overlooked. At the base of the keep the walls are twenty feet thick. The entrance is on the western side through a narrow gate leading to a flight of stone steps within. Ascending these you approach a broad and massive gate, the semicircular arch of which rests on corbels displaying grotesque heads. Passing through this, you attain a platform from which you have a view of the "donjon," with its damp and dismal walls, and stupendous Norman arches. In the centre of the floor of this "donjon" is yet to be seen the mouth of the well intended to supply the garrison with water in times of siege. In this "donjon" how many captives may not have pined! how many sighs may not have been breathed for liberty as the "iron entered the soul!" Passing along the platform, the visitor ascends, on the right, another flight of broad stone steps, forming the principal staircase, when he finds himself in what formed the guard-room; the stupendous fireplace, the recesses in the walls, the narrow windows, and the general character of the whole apartment, indicating its Norman origin. In this guard-room the late Marquis of Hertford had a huge table built, around which, with his noble visitors, it is stated he passed many pleasant hours in the summer seasons during the latter years of his life. This table, which still remains, occupies the guard-room on all sides to within about six feet of the walls, such are its gigantic dimensions. Proceeding again through a series of low arched passages, the guard-room communicates with two or three stone chambers lighted by loop-holes. They appear to have been intended as places of security, having been approached only through a succession of doors, which disappeared centuries ago, though the pivots are still left, with the holes in the solid stone, through which the massive bolts were shot. In one of these dark and dismal apartments, tradition states that "a ladye of high degree" was confined during the absence of her lord, who accompanied Richard Cœur de Lion to Palestine. She gave birth to a beautiful babe, who was seized by stealth in the temporary absence of the nurse, and carried off by freebooters in the guise of Flemish merchants. The "ladye" fretted and pined away, and her lord only returned in time to weep over her bier, and to die of a broken heart—the loss of his "ladye" and her babe being a keener stroke to him than the blow aimed at his breast by the bright steel of the Saracen. When the wind on winter's nights has souged and moaned through the windings of the castle, producing sounds like the sighs of troubled spirits, simple-minded peasants plodding homewards have often fancied they heard the wails of the "ladye," and the sorrowful complainings of her lord, alternating with the ditty of the nurse hushing the bright-eyed babe to sleep. Perhaps at that old window in the tower above, the nurse may have fondled that babe in her arms, and the burden of her song may have been something like the modern version, though not in the same words:—

"O slumber my darling, thy sire is a knight;
Thy mother a ladye so lovely and bright;
The hills and the dales and the towers we see,
They all shall belong, dear"

Thus dying upon the ear like the falling strains of a vespers hymn, as the soft cheek of the babe pressed its downy pillow, and the beautiful boy, the hope of a noble house, sank into his sweet and peaceful slumbers.

There is another object also of peculiar interest connected with this castle. From a broad doorway in the south-east tower, are presented what are evidently the remains of an oratory, or chapel, above the principal entrance. The top of the wall is embattled, and the two

windows of the chapel are yet in excellent preservation. The floor of this oratory no longer exists—the whole interior is a mass of ruins. To the eastern wall, however, are yet attached the remains of a *stone altar*. The visitor might well spend an hour in musing upon this spot.

"How many beads have here been told?
How many matins have been sung?"

The holy anthems and the notes of praise are now hushed; all is silent as the grave; on all sides, a series of crumbling ruins: hearts that once worshipped at that altar have centuries since mingled with common dust: ambition, virtue, guilt, age in its "scar and yellow leaf," sated with the world—youth, buoyant with hope and dreaming of "glorious war," have alike knelt here, and have alike passed away. As we turned from the spot, we thought of Bernard Barton's lines—

"Where religion's holy name
Hath preferred its sacred claim;
While a relic can be found
Count it still as hallowed ground."

But to proceed. The outer walls of the keep and towers are built in the fashion which from time immemorial has been characteristic of the district—flint and rubble faced with Caen stone. The interior walls are built entirely with stone of the same description, and seem destined to last to future ages. The corroding hand of time has made but few inroads; it is only here and there within the keep that the visitor can detect the slow progress of time's ravages. Perhaps there is no castle in the kingdom of the same antiquity in a better state of preservation.

Upon taking a minute survey of the exterior, the attention of the visitor is called to the site of what once formed a square building, adjoining the western side of the tower on the south-east of the keep. This building formed the principal entrance to the castle in its palmy days, communicating with a series of drawbridges, which, forming a passage over the outer and inner moats in the olden time, echoed to the heavy tread of the armed bands of the Malet, the Bigod and the Despenser, as they marched along in triumph with polished lance, and gay pennons fluttering in the breeze. About eighty years since, there was also standing near the keep a place locally termed the kettle-house, which was supposed to have been used as a kitchen. Between the moats and opposite the south-east tower, about twenty years ago, a wall was standing of circular form, about forty feet high, with parapets and battlements. This no doubt formed a part of the general plan of fortification. The moats still continue to be well defined, the inner one being fifteen feet, and the outer one thirty-eight feet from the walls. Indeed the *tout ensemble* impresses the visitor with a sense of the strength and security which were the characteristics of this stronghold of the Norman barons, surviving as it has done the wrecks of dynasties and the rallyings of power for nearly one thousand years.

The view from the top of the keep is very fine, overlooking an extent of country for many miles. On the west and south there are alternately presented woodland, grazing and corn districts, interspersed with the well-stocked and umbrageous game preserves of the Marquis of Hertford; on the east, bearing upon its ever-rolling waves many a gallant ship, the boundless expanse of the German Ocean.

A very curious story, connected with Orford Castle, recorded by Ralph Coggeshall, an old English chronicler, is still implicitly believed by the fishermen of the neighbourhood. The incident alluded to is said to have occurred in the year 1161, in the reign of Henry II. It is related that, one stormy day, certain fishermen of Orford, in casting their nets some distance from shore, caught a monster resembling a man in size and form. His head was bald, but he had a beard long and rugged. Astonished at what they had taken, the monster was

conveyed to the governor of the castle. An endeavour was made to domesticate this strange offering of old father Neptune. The monster would eat fish or flesh, but when either was presented to him in a raw state, he would "press it with his hands" previous to mastication. The monster would appear, however, to have had a very sorry sojourn amongst his new associates, for not satisfied with surveying him in his "human form," the inmates of the castle were in the habit of "tying him up by the heels," and subjecting him to other cruel torments, "to make him speak." The chronicler does not inform us of the result, but goes on to relate that the monster had a couch provided for him, upon which he lay down at sunset, and from which he regularly arose at sunrise. Eventually the governor permitted the fishermen to carry the stranger to the sea-shore, in order to witness his vagaries in his native element. There is an old-standing satire that the men of Coggeshall, in Essex, spread a net around their town to keep out the small-pox. Whether they borrowed the idea from the fishermen of Orford, local traditions do not state; but certain it is, upon the authority of Ralph Coggeshall, that the fishermen of Orford spread three rows of strong nets before a portion of the coast to prevent the escape of the monster, and then permitted him to betake himself to the briny elements. The result was what might have been anticipated. Monster though the stranger was pronounced to be, yet he seemed to possess more brains than the fishermen, for diving under the triple barrier of nets, he was soon beyond the control of his captors, and elevating himself upon the crests of the foaming waves derided the astonished fishermen, and soon disappeared in the depths of the sea. The fishermen, chagrined at the loss, returned in doleful plight to the governor of the castle. The monster, however, some time after returned, to the perfect surprise of the fishermen, and again made a sojourn at the castle. Not being kept under his former strict *surveillance*, a sort of confidence was established between both parties; but according to Ralph Coggeshall, "the monster being weary of living alone, at last stole away to sea, and was never heard of more." The tradition is still preserved. On stormy nights when the frail barks of the hardy fishermen are tossed about by the tempestuous waves; when the winds are howling and blustering along the shore, and the "donjon" of the old castle echoes to the strife of the furious elements, the wives and children of the brave mariners are sometimes wont to leave the warm chimney nook and peep fearfully through the half-opened casement into the dank and hazy atmosphere which envelopes this wild and desolate shore, to descry the welcome and well-known craft; retreating timidly as they bear a thought of the mysterious monster, designated the wild man of Orford.

The researches into the history of the respective governors of Orford Castle, are full of the deepest interest, introducing us to some of the most illustrious names that adorn our early annals, and to some of the most remarkable events that distinguished the career of the Norman invaders.

It has been already shown that Orford Castle was built A.D. 1067-8, under the direction of the Conqueror, by Robert Malet. Upon his attainder for high-treason, in 1103, Henry I. vested the Barony of Orford and the immediate possessions in Peter de Valoines, one of the attendants of the Conqueror, and steward in the royal household. By his successors the castle was held throughout the reigns of Stephen, Henry II., Richard I., up to the year 1204, in the reign of King John, when the barons rose, and eventually succeeded in obtaining Magna Charta. The influence exercised by this confederation caused the expulsion of the Valoines. In 1204, Hugh Bigod, one of the powerful Earls of Norfolk, who had defended his castles at Ipswich and Walton against Stephen, was made Governor of Orford. He was one of the twenty-five barons chosen as conservators of the public liberties, to whom all men were bound to swear

obedience under penalty of confiscation. For the part Hugh Bigod acted, he was excommunicated by Pope Innocent III.; pursued, also, by the relentless enmity of the king, John, who never forgot or forgave, and took the earliest means for accelerating his fall. In 1215, when war again broke out between John and the barons, and William de Albini, their most puissant leader, was taken prisoner, the king, finding his arms triumphant, removed Hugh Bigod from the governorship of Orford Castle, and placed the responsibility in the hands of Hubert de Burgh, another illustrious name. Hubert de Burgh rendered essential service to the crown, upon the invasion of Louis, son of Philip of France, by opposing, with the greatest fidelity and valour, the French forces, invited over by the refractory barons, under the command of the Count de Perche, who, in 1216, fell at the siege of Lincoln Castle. Having also rendered eminent service at the siege of Dover, Hubert de Burgh was, upon the death of John and the accession of Henry III., in 1216, appointed High Justiciary of England. He is represented to have been the ablest and most virtuous minister whom Henry III. ever possessed; faithful to the crown in the most difficult and dangerous times, with no disposition to enslave or to oppress the people. Loaded with favours and honours beyond any other subject, a conspiracy was got up against him by the discontented barons. Amongst other crimes, Hume states that he was accused of gaining the king's affections by enchantment, and of purloining from the royal treasury a gem which had the virtue to render the wearer invulnerable. The faithful minister was abandoned by the king, and, after being for a time confined in the Castle of Devises, made his escape; after which, he again so far exercised his "powers of enchantment," as to impress the king with the conviction that his services were invaluable to the state, and he was consequently again received into royal favour. The next illustrious name we find in connexion with Orford Castle, is that of Hugh le Despenser, who, with his son, in the reign of the unfortunate Edward II., made himself so conspicuous in the part he took against Queen Isabella, and her paramour, Roger Mortimer. Hugh le Despenser appears to have succeeded Hubert de Burgh until about the year 1262, when Simon de Montfort, Earl of Leicester, laid claim to the throne. After the parliament, called "the mad parliament," held at Orford in 1268, the first act of Simon de Montfort and the twenty-four confederated barons, was to displace all the chief officers of the crown, and to replace such officers by others of their own appointment. Henry III. proclaimed this breach of trust; and to mark his displeasure, with others, removed Hugh le Despenser from the governorship of Orford Castle, at the same time placing new governors and new garrisons in most of the castles throughout the kingdom. Hugh le Despenser was succeeded by Philip Marmion, descendant of a Norman baron. In 1268, Simon de Montfort, having formed a new conspiracy in France, commenced an open rebellion, and he and the insurgent barons were reinvested with the sovereignty of the kingdom. One of their first acts was to restore Hugh le Despenser to the office of High Justiciary; and he was again also reinstated in the governorship of Orford Castle. This he appears to have held through the civil wars, during the predominance of Simon de Montfort up to 1265, when the Battle of Evesham proved the death-blow to Simon de Montfort and his faction. After this triumph of the royal arms, all the castles, including Orford, were surrendered to the crown, Simon de Montfort being the only baron who was made the subject of attainder; Hugh le Despenser being compelled, with other barons, to make composition with the crown to an extent not exceeding five years' rental of their respective estates. Although, at this period of history, Hugh le Despenser thus lost the royal favour, yet he was afterwards again reinstated in the office of Governor of Orford Castle, and, with his son, occupied a brilliant position down to the reign of

Edward II., when Roger Mortimer, succeeding in his rebellion and invasion under the auspices of Queen Isabella, effected the destruction of both the Despensers, the royal favourites; the elder, at ninety years of age, being hanged, and his body thrown to the dogs; the latter being also, without trial, brought to the block.

Such is a sketch of the early history of Orford Castle in those eventful and bloody times. It now only remains to be added, that the elder Despensers was succeeded, in 1336, (Edward III.,) by Robert de Ufford, who married Cecilia, daughter and co-heiress of Robert de la Valoines. In 1382, (Richard II.,) William de Ufford died seized of the castle and domain, which were assigned for the dowry of Isabella his wife. This lady survived her husband thirty-five years. Upon her demise, in 1417, Robert, Lord Willoughby De Eresby, whose ancestor led the second line of the English forces at the Battle of Cressy, had livery of the castle and town of Orford; and in this family both remained until 1526, (Henry VIII.,) when William, Lord Willoughby, died, leaving as his heiress his daughter Catherine. In 1529, the wardship of Catherine devolved upon Charles Brandon; and in 1535, having made proof of her age, she had livery of the lands and castle of Orford as her inheritance, and thereupon became fourth wife of the great Duke of Suffolk. Upon his death, in 1545, the duchess married Charles Bertie, Esq., a gentleman skilled in various foreign languages, and member of a family of high rank. Both were zealous promoters of the Reformation, and suffered much in its cause, being compelled, upon Mary's accession, to quit the kingdom in order to save their lives. A curious old ballad, published in the reign of Queen Elizabeth, commemorative of their example, is yet extant, entitled, "The most rare and excellent History of the Duchess of Suffolk, and her husband, Richard Bertie's Calamities: to the tune of 'Queen Dido.'" Upon the death of the Duchess of Suffolk, in 1580, her son and heir, Peregrine Bertie, who was born at Wesel, one of the Hans Towns, claimed the dignity and title of Willoughby de Eresby, which, being allowed, he had summons to Parliament. By Sir Robert Naunton, in the "Fragments Regalia," he is named as "one of the queen's first swordsmen, and a just master of the military art." About 1595, the Castle of Orford passed from this illustrious family to Sir Michael Stanhope, Knt., county Notts, who, it is said, occupied a high position in the councils of Elizabeth and James I. It afterwards descended to the Hon. Pryce Devereux, Lord Viscount Hereford, whose heirs held it, with the manor of Sudborne, until about 1780, when both were purchased by Francis, eldest son of Francis Lord Conway, Baron Conway, of Rageley, Warwickshire; who, on the third of August, 1750, was created Earl of Hertford and Viscount Beauchamp; being advanced also on July 5th, 1793, to the high rank of Marquis of Hertford and Earl of Yarmouth.

Our narrative, compiled from many original sources, exclusively our own, now comes to a close. Under the auspices of the noble house of Hertford, we trust the fine old Castle of Orford will be preserved unimpaired to future generations, which, like the present, will not fail to dwell with wonder and delight upon this hoary memento of the chivalry of England in those times when the galleries, now silent and deserted, echoed hoarsely to the warlike preparations of stalwart men-at-arms; or when, amidst flowing wine-cups, the old castle echoed softly to the mellifluous strains of the harper welcoming the chieftain back from the plains of Palestine.

R. T.

GUN-COTTON.

THE great Edmund Burke, almost in the same page that he laments the departure of the age of chivalry, has this acute observation: "From the earliest dawning of policy to this day, the invention of men has been sharp-

oning and improving the mystery of murder, from the first essay of clubs and stones to the present perfection of gunnery, cannoneering, bombing, mining." Much as the genius of "our good Edmund" luxuriated in speculative philosophy, and luminous as was his course of action and thought, he could scarcely have meditated on the vast number of means for "sharpening and improving," which science has, of late years, devised; all of them involving considerations of the highest importance to the welfare of the human race; a proximate effect of these discoveries, doubtless, being, in a great measure, the extinction of the curse and calamity of war. Its chivalry will, indeed, then have departed; and the contest, so long as it remain, will have none of those brilliant episodes of human action which are the *ignes fatui* of hero-worship. No more—

"An iron harvest on the field appears,
Of lances, burnished shields, and bristling spears;"

or,—

"The various glories of their arms combine,
And in one fearful, dazzling medley join.
The air above, and all the fields beneath,
Shine with a bright variety of death."

But we must leave the heroic age, and come to our own times.

Cotton, having already contributed largely to our national prosperity in times of peace, is likely to play a very important part in the strategies of war. The discovery is already disputed: it is the old story of Columbus and the egg; the egg now stands erect, and every one makes fulminating, or gun-cotton: it is very easy when one knows the way.

We believe the credit of the discovery to be due to Professor Schonbein, of Basle, the discoverer of ozone, an element analogous in its chemical character to chlorine. The novelty was first announced as an explosive compound, possessing many apparent advantages over gunpowder. It was described as a cotton, prepared by a secret process: on the application of a spark, the solid mass is at once converted to a gaseous state; and in an experiment performed in the laboratory of Professor Schonbein, a certain weight of gunpowder, when fired, filled the apartment with smoke; whilst an equal weight of cotton exploded without producing any smoke, leaving only a few atoms of carbonaceous matter behind. Common balls and shells were experimentally projected by this prepared cotton, which was stated to have nearly doubled the projectile force of gunpowder. Professor Schonbein made an interesting experiment on the wall of an old castle: it had been calculated that from three to four pounds of gunpowder would be requisite to destroy this wall, and a hole capable of containing that quantity was prepared. In this aperture were put four ounces of the prepared cotton, which, when fired, blew the massive wall to pieces.

Again, the sixteenth part of an ounce of the prepared cotton, placed in a gun, carried a ball with such force that it perforated two planks at the distance of fifty-eight paces; and, at another time, with the same charge and distance, drove a bullet into a wall to the depth of 3½ inches. In other experiments, a drachm of cotton sent a ball, three-quarters of an ounce weight, to a distance of two hundred paces, where it penetrated a deal plank to the depth of two inches. A portion of this cotton, when thrown into water, and afterwards dried, did not lose its inflammable property.

Such were the experiments made by Professor Schonbein, with this new explosive power, in Switzerland. In September last, the *savant* attended the Meeting of the British Association for the Advancement of Science, at Southampton; and, the fame of the gun-cotton having travelled much faster than the Professor, great was the curiosity of the members of the Association to witness

the operation of this new power. At one of the evening meetings, its properties were explained and experimented with by Professor Grove. The explosive force was stated to be double that of gunpowder, yet the substance left no soil on fire-arms. There are two qualities of the gun-cotton: the second-best causing little smoke, the other none. Gunpowder explodes at 600° of heat; gun-cotton at 400°; and it may be exploded on gunpowder without the powder igniting!

Mr. Grove first exploded a small quantity of gunpowder, for the purpose of showing the large quantity of smoke it evolved. He then fired a small lock of the gun-cotton, of the second quality; it flashed off as rapidly as gunpowder, and but a very small quantity of smoke was perceptible; the paper on which it exploded being but slightly stained. The best quality of gun-cotton exploded still more rapidly, without any smoke whatever; and it gave out an orange-coloured flame.

Mr. Grove next steeped a piece of the cotton in a glass of water, and then pressed it and dried it between blotting-paper; and though it could not have been thoroughly dry in the time, the cotton flashed off when heated wire was applied to it, and without any perceptible smoke. The flash, however, was not, in this case, so instantaneous as that of the perfectly dry cotton.

The last experiment was the explosion of a piece of the gun-cotton placed upon loose gunpowder, without firing the latter. This was perfectly successful; though the cotton must be quite dry to insure its success; for, if the combustion be less rapid, the gunpowder will explode.

These experiments were witnessed by his Royal Highness Prince Albert, who was present at the meeting, and was elected an honorary member of the Association.

Subsequently, Professor Schonbein attended at Osborne House to exhibit the properties of his gun-cotton to Prince Albert, when the Professor offered to explode a portion on the hand of Colonel B—; but the gallant colonel recoiled from the experiment, and would have nothing to do with the novel power. Prince Albert himself, however, submitted to the test; and off went the cotton, without smoke, stain, or burning of the skin. Thus encouraged, the colonel took his turn; but, whether the material was changed or not for the coarser preparation, it gave him such a singeing that he leaped up with a cry of pain. A hearty laugh was all the commiseration he received. After this, Professor Schonbein loaded a fowling-piece with cotton in the place of powder, and the Prince fired both ball and shot from it with the usual effect, and perfect impunity. We give this anecdote upon the authority of the *Literary Gazette*.

The advantages attendant upon the use of gun-cotton for blasting in mines must, we think, be very great; since the smoke proceeding from the coarse gunpowder, used for this purpose, occasions so much annoyance, and injury to the health of the miners. Experiments have been made in some of the Cornish mines, and have proved most satisfactory and conclusive in favour of gun-cotton, one ounce of which proves equal to one pound of gunpowder.

Some additional projectile experiments have also been made in the grounds of Mr. Barron, at Stanmore, with fowling-pieces and rifles. Thus, as reported in the *Athenæum*, a gun, charged with thirty grains of prepared cotton, propelled an equal charge of shot, with greater force and precision, at a distance of forty yards, than was done by the same gun loaded with a hundred and twenty grains of gunpowder. A rifle, charged with fifty-four and a half grains of gunpowder, sent a ball through seven boards, half an inch in thickness, at a distance of forty yards; the same rifle, charged with forty grains of gun-cotton, propelled the ball into the eighth board. Another rifle, which had been used for elephant shooting, and consequently carried a much larger ball, charged with forty grains of gun-cotton, propelled the ball through eight boards, at a distance of ninety

yards. In no case was the discharge accompanied by a greater recoil than usual; and the reports were not louder than those accompanying the discharge of guns and rifles loaded with gunpowder.

As Professor Schonbein came to England with the view of patenting his discovery, he did not divulge the secret to his brother *savans* at the Southampton Meeting. He is said to have offered it to the British government; and a hundred-weight of the gun-cotton is stated to have been despatched from Basle to Woolwich, with the view of testing its applicability to heavy ordnance. Still this statement is at variance with a representation current, that the Diet of Mentz has proposed an award to the Professor, for communicating to them his gun-cotton secret. We may here mention, that its manufacture is unattended by risk; and that it can be effected in the small space of eight hours, and at a less cost than gunpowder.

Schonbein is believed still to retain his secret intact; but other original thinkers have been at work, and produced very similar results. Indeed, the subject of explosive compounds has largely engaged the attention of European chemists, of late years, owing partly to the high pitch of public curiosity as to the secret of Lieutenant Warner's new destructive power. So fearful an antagonism it is naturally an object of national competition to possess; and, were it not that we consider such annihilating power must lead to the cessation of great wars, we should regard such discoveries as the wanton waste of genius. As it is, however, there is a glorious anticipation abroad of the humanizing effect of these scientific triumphs, which, we pray, may be amply realized.

Almost simultaneously have appeared three or four inventors of other explosive agents. Bættier, of Frankfort, has discovered one; and Dr. Otto, Professor of Chemistry, in Brunswick, relying on an observation of Relouze, contained in the 136th page of Professor Otto's *Manual of Chemistry*, has succeeded in producing an exploding cotton, which, after a series of experiments, seems quite to supply the place of gunpowder. We quote the Doctor's own account of the invention, which he has given for the general good of the public:—

"In the preparation of the exploding cotton, common, well-cleaned cotton, is dipped for about half a minute in highly concentrated nitric acid, (the acid which I use being made by the distillation of ten parts of dried saltpetre, and six of oil of vitriol,) and then instantly placed in water, which must be often renewed, in order to free the cotton from the acid with which it is impregnated. Care must then be taken that all the knotty parts be properly disentangled, and that it be thoroughly dried. After this, the explosive cotton will be ready for use. Its effects create astonishment in all who witness them: the smallest portion, when struck on an anvil with a hammer, explodes like fulminating powder; when kindled with a glowing body, it takes fire like gunpowder; and when used in a gun, its operation, though in a far greater proportion to its weight, is precisely the same as that of gunpowder. This gun-cotton is employed in the same way as gunpowder: a piece of it is rammed down the barrel, then a bit of wadding, and after that a ball; a copper cap ignites and explodes the cotton." Dr. Otto's statement is accompanied by a testimonial, and he adds, "without a single exception, all who have witnessed my experiments have been most completely satisfied."

The editor of the *Pharmaceutical Times* is entitled to be heard on the subject, from his presumed familiarity with chemical manipulation. Now, he has prepared cotton according to Professor Otto's directions, but has found it to acquire a fulminating property by no means so great as described. The method is by steeping cotton for half a minute in nitric acid, and then drying it: "on adding, however, sulphuric acid to the nitric acid, then proceeding as before, the result was different; and a

cotton was obtained which possessed all the properties of fulmination and capability of disruption and projection stated by Professor Schonbein. We were induced to try the effect of mixing sulphuric acid with nitric, from a consideration of the remarkable affinity which the former acid evinces for water, thus concentrating the nitric acid to its maximum. Many of our readers, who may have in boyhood amused themselves with performing scientific experiments, will, doubtless, be cognizant of the one which has for its object the inflammation of certain essential oils by the agency of nitric acid. They will not fail to remember that, if such acid be not very strong, the result will not take place, but that inflammation is immediately caused by the addition of a little sulphuric acid.

"Prepared by the process we have indicated, gun-cotton resembles, to some extent, the ordinary material; but, in some cases, it assumes a slightly yellow colour. It explodes by the percussion or friction of iron against iron, or any metal of similar hardness, and also when exposed to a temperature of 400° Fahrenheit,—circumstances to be borne in mind when we come to speak of the application of this cotton to the purposes of fire-arms.

"Having tried the effects of this cotton as a projectile agent for small arms, its relative agency in propelling a ball would appear to be about equal to the finest sporting gunpowder, than which it occupies more space in a gun, on account of its lighter specific gravity,—a fact which must not be lost sight of."

The writer then examines the circumstances of using the cotton for small fire-arms, and finds three difficulties: 1, the chance of the fibres of the cotton getting between the ramrod and barrel, and thus prematurely exploding; 2, if the barrel be considerably heated by continuous firings, the cotton may explode, even without friction, and its use, from this cause, would be impossible in many cases of actual service; 3, the doubt whether the cotton will find its way into the chamber or contracted breeching of a gun, spontaneously, like gunpowder. Lastly, the property which this remarkable body possesses of not soiling a piece, would render it, *ceteris paribus*, invaluable; but this, the writer fears, is not the case. He anticipates the greater advantages from this body as applied to mining operations; for here, the evolution of smoke in the confined space in which the miner is compelled to work, is a serious disadvantage.

Two other claimants remain to be noticed. M. Morel, the engineer, at Paris, has just produced "a fulminating matter, having all the appearance of cotton and wadding, which he has tried in the presence of General Gourgaud, President of the Committee of Artillery; Colonel Piobert, Member of the Academy of Sciences; and several other officers. The following details of the experiments are from the *Messenger*, Paris paper:—

"Burned on the hand, it causes no sensible pain, leaves no stain, and produces no smoke. Dipped in water and pressed, and afterwards dried between two leaves of blotting-paper, it preserves its fulminating properties. General Gourgaud fired a charge of fulminating cotton from an ordinary fowling-piece at a distance of forty yards from the object at which he aimed. He fired a holster pistol at a distance of twenty-five yards, and a pocket pistol at a distance of ten yards. At forty yards, a ball from the fowling-piece traversed a plank of beech of 0.35 centimetres thickness; at twenty-five yards, the ball from the holster pistol lodged in the plank without perforating it; the ball from the pocket pistol made the same impression on the plank as that which might have been produced by a charge of ordinary gunpowder. The charge of fulminating cotton leaves scarcely any residue in the barrel. The recoil of the gun is extremely slight, and the report is not louder than that of a large detonating cap."

"M. Chodako, a Polish refugee, likewise presented a fulminating substance, which has the appearance of

cotton, and which was tried with an artillery musketoon, fired at forty yards. The ball produced the same effect as that fired by fulminating cotton, but it left a considerable deposit in the barrel. The cotton powder of M. Chodako was compressed into a wadding in order to charge the gun, whilst the fulminating cotton was not. Both materials ignite by the blow of a hammer on an anvil, but not by the blow of a hammer on wood."

Meanwhile, it will be interesting to watch the experimental applications of this new explosive power, to the practical value of which various conditions are essential. We have here submitted to our readers the leading facts of the discovery; and at present have only to add our best hopes of its proving a scientific benefaction to the community.

THE STREETS OF LONDON.¹

To trace the gradual development of a great metropolis from the nucleus around which the small community had originally congregated: to pursue its *efflorescence* into streets, lanes, alleys, squares, circuses, paragonas, and crescents: to speculate on the names given to them, and the causes of their imposition, originating in peculiarities of the locale, in the appellations of the builders, or the purposes for which the buildings were designed: to investigate the history of their respective inhabitants, and their fortunes and changes, could not but afford much amusement, probably much moral instruction. These desirable results may be obtained from even a less extensive consideration of this interesting subject; and Dr. Mackay has produced two most entertaining and instructive volumes, replete with information, amusement, and anecdote of every description, political, statistical, biographical, historical, or theatrical. They are written in a lively, *chit-chat*, *off-hand* style, adapted to the subject; and form (what Mr. Smith entitled another of his publications,) an admirable "Book for a rainy day." There is no Preface, and, what is an unpardonable deficiency in a literary work, especially in one of this nature, *no Index*!

We shall proceed to select such passages as, we imagine, may in any way interest our readers; adding occasionally some remarks of our own.

The Ramble begins with a journey from "Hyde Park Corner to Charing Cross." The first object of attraction is "Apsley House." "Apsley House is interesting, as being the residence of the greatest captain and one of the greatest men of this or of any former age. Time, which must make it venerable, will confer more and more lustre upon it, and a century hence, what we now look upon with curiosity will be regarded with reverence."—Vol. i. p. 5.

Mr. Smith passes over in silence the *iron revolving shutters*, conveying so striking a memorial of the uncertainty and fickleness of the English. Our school-boy recollections rise up, as often as we see them; and the treatment of Miltiades recurs to our mind. We recollect seeing the Duke, during a popular ebullition of congratulation, smiling calmly at the mob who were cheering him, and pointing to these shutters.

"Some years ago, as our readers are probably aware, it was decided to commemorate the achievements of the Duke of Wellington by a testimonial. The execution of this work was confided to the competent genius of

(1) An Antiquarian Ramble in the Streets of London, with anecdotes of their more celebrated Residents. By J. T. Smith. Edited by Charles Mackay, LL.D. 2 vols. 8vo. 1848.

Mr. Wyatt. That gentleman entered upon his grateful task, and completed a design which is said to be worthy of the artist; and which, undoubtedly, is the largest equestrian statue in the world. The work finished, it became a grave question where it was to be placed. A committee of noblemen and gentlemen of reputed taste was accordingly formed, to take into consideration at what spot, or on what eminence this mighty man and horse might most worthily be stationed. The committee (having obtained her Majesty's sanction and approval) at length decided that the top of the triumphal arch was the place, of all others, to show to admiration the beauty of Mr. Wyatt's magnificent statue. But now the critic began to carp: there was no precedent for an equestrian statue on an arch; besides, the arch itself was too small for the statue. One noble lord pleasantly observed, that when the horse was placed on its destined summit, it would appear from his windows like that wondrous horse 'whereon the Tartar king did ride;' an aerial steed that had walked or galloped, or was about to do so, over the houses. But his lordship forgot that if the arch had been a pedestal, the selfsame appearance would be presented to him.

"It has at length been arranged that the horse and his rider shall be suffered to ascend the arch 'on trial.' If an enlightened public, after due examination, do not approve their appearance, they are to come down again; when some other, and, if possible, better situation, will be chosen for them. We venture to predict, that once up, they will not come down; and we shall not be surprised if, after all, it be acknowledged that the much-derided committee have chosen well and wisely."—*Ibid.* pp. 6, 7.

In this prediction and expectation we heartily concur. The discussions on this subject have nothing whatsoever to do with sculpture or architecture.

The public-houses contiguous to Hyde Park, about the middle of the last century,

"Were chiefly resorted to by soldiers, particularly on review days, when there were long wooden seats fixed in the street before the houses for the accommodation of six or seven barbers, who were employed on field-days in powdering those youths who were not adroit enough to dress each other. Yet it was not unusual for twenty or thirty of the elder soldiers to bestride a form in the open air, where each combed, soaped, powdered, and tied the hair of his comrade, and afterwards underwent the same operation himself."—*Ibid.* p. 8.

"In the vestry of St. James's church are carefully preserved the portraits of the eminent prelates Tenison, Clarke, Secker, and Parker!"—*Ibid.* p. 25.

Clarke never was a Bishop, and Dr. Parker was the last Rector of the parish but three. The portraits extend, in a consecutive series, from the first rector of the parish up to the present Dean of Lincoln.

"The following is an extract from Cole's MSS. vol. xxxi. page 171, in the British Museum:—"The following humorous address was supposed to be wrote by Colonel Lytleton, brother to Sir George Lytleton, in 1752, on his Majesty's return from Hanover, when numberless addresses were presented. White's chocolate-house, near St. James's palace, was the famous gaming house where most of the nobility had meetings, and a society. It was given to me December 8th, 1752, by Sir Robert Smyth, Bart. at Horseth Hall:—

THE GAMESTERS' ADDRESS TO THE KING.

Most righteous Sovereign:

May it please your Majesty,
We, the lords, knights, &c. of the Society of White's, beg leave to throw ourselves at your Majesty's feet (our honours and consciences lying under the table, &c., our fortunes being at stake), and congratulate your Majesty's

happy return to these kingdoms, which assembles us together, to the great advantage of some, the ruin of others, and the unspeakable satisfaction of all—both us, our wives, and children.

We beg leave to acknowledge your Majesty's great goodness and lenity in allowing us to break those laws which we ourselves have made, and you have sanctified and confirmed, while your Majesty alone religiously observes and regards them.

And we beg leave to assure your Majesty of our most unfeigned loyalty and attachment to your sacred person; and that, next to the Kings of Diamonds, Spades, Clubs, and Hearts, we love, honour, and adore you.

To which his Majesty was pleased to return this most gracious answer:—

My Lords and Gentlemen,

I return you my thanks for your loyal address; but whilst I have such rivals in your affections as you tell me, I can neither think it worth preserving or regarding. I look upon you yourselves as a pack of cards, and shall deal with you accordingly."—*Ibid.* p. 42.

"An interesting anecdote of the first arrival of George the Second in his palace of St. James's, is related in the recently published correspondence of Horace Walpole. Sir Robert often complained to him in Latin (for the minister spoke no German, and the king no English) that the Hanoverians in his train were so venal and rapacious; to which his Majesty at once replied by giving an instance of the venality and rapacity of English servants, always on the look out for vails. 'This is a strange country,' said the king. 'The first morning after my arrival at St. James's, I looked out of the window, and saw a park, with walks, a canal, &c. which they told me were mine. The next day, Lord Chetwynd, the ranger of my park, sent me a fine brace of carp, out of my canal; and I was told I must give five guineas to Lord Chetwynd's servant for bringing me my own carp, out of my own canal, in my own park.'"—*Ibid.* pp. 58, 59.

"Before houses were numbered, it was a common practice with tradesmen not much known, when they advertized, to mention the colour of their next neighbour's door, balcony, or lamp; of which custom the following copy of a hand-bill will present a curious instance:—

'Next to the Golden Door, opposite Gt. Suffolk St., near Pall Mall, at the Barber's Pole, liveth a certain person, Robert Barker, who, having found out an excellent method for sweating or fluxing of wigs, his prices are 2s. 6d. for each bob, and 3s. for every tye-wig and pig-tail, ready money.'"—*Ibid.* pp. 81, 82.

An admirable remark, in our opinion, is made in p. 103. We shall quote it, at the hazard of being considered devoid of all taste.

"The equestrian statue of George the Third was erected in 1837, and is the work of Mr. Wyatt. Its cost was upwards of 4,000*l*. Critics object to the cocked hat and tye-wig in the royal figure; but some ages hence the abused parts will be the most valuable in the whole statue. It may very reasonably be asked, why a plain English gentleman should be represented in the dress of a Roman tribune? Let the man appear, even in a statue, in his habit as he lived, and whatever we may say, posterity will be grateful to us. We should like to know exactly the walking-dress of Cæsar or Brutus, and how they wore their hair; and we should not complain if they had cocked hats or periwigs, if we knew them to be exact copies of nature."—*Ibid.* p. 103.

Dr. Johnson, or Dr. Adam Smith, (we forget which,) was glad to know that Milton wore latches in his shoes instead of buckles; and our present author, defending Malone from "the sarcastic author of the Pursuits of Literature," justly observes,—

"Surely, however, where Dryden is the theme, the biographer who records these little traits of character and domestic life is entitled not only to our forgiveness, but to our gratitude."—*Ibid.* p. 40. Note.

The following statement is highly exaggerated:—

"Passing from Leicester Square, we went, until recently, through Cranbourne Alley, the great bonnet mart of London. Those who are ignorant of the town may be amused to learn that at every shop door in this alley, while it existed, a young woman, of decent appearance, was stationed all day long, on the watch for customers, whom it was her business to entice or drag into the shop, and force to purchase whether they would or no. These women were known by the name of "She Barkers," to distinguish them from the "He Barkers," who were stationed at the second-hand clothes shops, and who acted the same annoying part towards men. Woe used to betide the women of the middle classes who passed through Cranbourne Alley with an unfashionable bonnet! It was immediately seen from one end of the place to the other, and twenty barkers beset her, each in turn, as she walked forward, arresting her course by invitations to inspect what was for sale within. Many a one has had her cloak or shawl torn from her back by these rival sisters of trade during their struggles to draw her within their den, each pulling a different way."—*Ibid.* p. 125.

The absurd notion "that the horse is without a girth," on which Charles I. is sitting at Charing Cross, is satisfactorily refuted. Perhaps it is not generally known that the sword has been stolen within the last few years.

Another instance of misrepresentation occurs in p. 152—

"Rare Ben [Jonson] also lived in an alley, as appears from his famous answer to King Charles I., who had sent him a very tardy and very small (!) sum, when he was in poverty and sickness. 'I suppose he sends me this, because I live in an alley. Tell him his soul lives in an alley.'"

Now this atrocious calumny was refuted thirty years ago! "Charles sent him a hundred pounds, a noble present in those days; for which Jonson returned him thanks in an epigram (vol. viii. p. 453) full of gratitude and dutiful affection."—Ben Jonson's Works, by Gifford, vol. v. p. 339. The conclusion of Gifford's note we omit, but trust it will raise a blush in the cheeks of the authors of "An Antiquarian Ramble through the Streets of London."

"Mr. Apreece, a tall thin man, in rich dress, was her [Moll King's] constant customer. He was called *Cadwalader* by the frequenters of Moll's."—*Ibid.* p. 266.

He was the original whom Foote took off under that name, in his farce of "The Author."

Our present limits will not allow us to dwell upon the various information drawn together, and concentrated, in the four Rambles that form the subject of this first volume—information almost necessary to those who would relish the dramatists, novelists, newswriters, and essayists of the last century. Names of clubs, taverns and hotels, coffee-houses, the resort of the wits of that day, according as their politics were Whig or Tory, and mug-houses of lower pretensions, theatres, and places of entertainment now long forgotten, actors and actresses, are brought before us with a vividness of representation, that we may almost imagine we are seeing a "Dissolving View of London in the Olden Time."

(To be concluded in the next.)

GLACIERS.

"As a large stone is sometimes seen to lie,
Couched on the bald top of an eminence;
Wonder to all who do the same spy,
By what means it could hither come, or whence;
So that it seems a thing endued with sense,
Like a sea-beast crawled forth, that on a shelf
Of rock or sand reposes, there to sun itself."

Wordsworth.

IN a former number we have watched the tiny coral insects in their unceasing labours; and have seen them raise afresh the island which volcanic action had plunged suddenly, or caused to subside gradually, beneath the surface of the ocean. This is the routine which scientific investigation has disclosed to us in the warmer regions of our globe; let us now turn our attention northward, and endeavour to understand the action of ice, as regards the "erratic blocks," or "boulder stones," which have so much puzzled geologists. Light has broken in upon this dark question, and the agent by which these ponderous travellers have been transported from the mountain peak and delicately poised upon its side, or carried from their resting place into the valley below, has been beautifully traced by Professor Forbes, whose work, "Travels in the Alps," contains minute and interesting details upon the subject of the structure and motion of glaciers. Our business lies more immediately with their effects; but in order to understand these, we must enter slightly into the nature of the wonderful agent employed.

A Glacier is a frozen torrent proceeding from the upper valley of mountains where the snow never melts, and fed by vast reservoirs whose contents never decrease. It moves with a steady flow, "although no eye sees its motion; but, from day to day, from year to year, the secret silent cause produces the certain slow effect; the avalanche feeds it, and swells its flowing tide; the mightiest masses which lightning or the elements roll from the mountain side upon its surface, are borne along without pause; when the glacier, advancing beyond its usual limit, presses forward into the lower valleys, it turns up the soil, and wrinkles, far in advance, the greensward of the meadows with its tremendous ploughshare; it brings among the fields the blasts of winter, and overthrows trees and houses like stubble in its ruthless progress; no combination of power and skill can stay its march, and who can define the limit of its aggression? Its proud waves are however stayed, and, by causes as mysterious as those of its enlargement, it retreats year by year within its former limits; but where the garden and the meadow were, it has left a desolate spread of ruin, like the fall of a mountain, which never again may be tilled, and over which for at least half a century not even a goat shall pick the scanty herbage."

The downwards movement of a glacier has not been doubted, although the causes and manner of its motion have been much disputed; two theories, that of *dilatation*, and that of *gravitation*, have been advanced, but Professor Forbes's opinion does not entirely coincide with either of these. He has shown that instead of sliding forwards in a body by the force of gravity, the glaciers move more rapidly in the centre than at the edges, and more rapidly at the surface than on its under side; and also that the ice continues its downward course during winter, when, there being no alternations of frost and thaw, there can be no dilatation.

The termination of a glacier presents a crystal wall: from beneath issues a stream of ice-cold turbid water; derived from springs rising in the earth under the glacier; from a slight melting of the under surface by the warmth of the earth; from the rain and melted snow, which in summer filters through the "crevasses," and from the wasting of the glacier itself, by the action of sun and rain. The river Dranse thus has its origin from the glacier of Chermontane in the Val de Bagnes, where, in 1818, some terrific scenes occurred in consequence of the river having been dammed up by an increasing glacier.

cler. The cause of the mischief was the glacier of Getroz, which spreading across the valley, formed, by the stoppage of the Dranse, an immense and deep lake. In order to avert the danger, a canal was cut through the ice in the hope of draining the lake before the warm weather of spring should cause it to burst, but the water was not sufficiently warm to wear away the ice rapidly, and the cascade tumbling over the icy barrier so loosened the soil as to detach the ice from the mountain; the consequence of which was that "a flood, five times greater than that of the Rhine at Basle, filled the bed of a mountain torrent." Captain Hall was on the spot soon after the catastrophe, and has given an account of it in the first volume of "Patchwork."

In the same valley the glacier de la Brenna had extended in 1822, as far as to cross the torrent, which made its way under it, and to rise to a great height on the opposite side, where it threw up a vast mound of rocky fragments. An area of many acres in extent is now left uncovered by the glacier, strewed with blocks and debris, and doomed to sterility.

The middle portion of a glacier is a gently sloping icy torrent, from half a mile to three miles wide, more or less undulating, and having its surface broken by "crevasses," from a few inches to many feet in width, generally vertical, and sometimes extending almost from side to side of the glacier. The surface is rough, with hollows, which in warm weather have rills and streams of considerable volume and velocity. These, unlike the water escaping from beneath the glacier, are of exquisite purity, beautiful and refreshing. After a short course, they are precipitated into the crevasses, forming bold cascades, and probably at length joining the stream which issues from the end of the icy plain.

"Nothing is more striking than the contrast which day and night produce in the superficial drainage of the glacier. No sooner is the sun set than the rapid chill of evening reducing the temperature of the air to the freezing point or lower, the nocturnal radiation at the same time violently cooling the surface, the glacier life seems to lie torpid—the sparkling rills shrink and come to nothing—their gushing murmurs and the roar of their waterfalls gradually subside—and by the time that the ruddy tints have quitted the higher hill-tops, a deathlike silence reigns amidst these untenanted wilds."

In this part of its course the glacier is more or less covered with blocks of stone which are borne upon its surface, and which may be marked year by year descending with the icy stream, determining its "deliberate speed." These have fallen from the cliffs which usually bound both sides of a glacier in its middle portion, and may be seen to fall almost every summer's day, burdening the glacier on each side with a band of blocks, and not unfrequently bringing down to the mineralogist specimens which would otherwise have been far beyond his reach, but whose native place may be surely inferred by observing the direction of the ice stream which is charged with them. These stony borders are called *Moraines*. Occasionally the blocks fall into a space between the glacier and the boundary wall, which is caused by the heat of the earth slightly melting the ice; there they are ground and chafed by the movement of the glacier, also making grooves and scratches parallel to it on the rocks which it passes. Besides this, the glacier sinks towards the sides, and the blocks lodge there, grating against the rocks. If, as occurs in particular seasons, the glacier be elevated by an increase in its quantity, the moraines are also lifted up; and when the return of summer or warmer seasons reduces the ice to its former bulk, the blocks are deposited at the higher level. Thus the situation of many blocks in different parts of the world may be accounted for.

It often happens that two glaciers meet in a valley, from different sources, each bearing with it edgings of moraines; it is obvious that in such cases the two inner moraines must unite, and thus a third or centre band is formed. A similar junction may again take

place, and thus many moraines may be borne along by their united glacier, each band of blocks showing by its character the varied composition of the parent mountains. A curious circumstance respecting the large blocks is, that the ice upon which they rest, not being exposed to the sun and rain, does not melt as in uncovered parts of the glacier, and hence the blocks appear as if elevated on icy pedestals, until the weight becoming too much for its support, the blocks slide down, and protecting a fresh spot of ice, the process is repeated. This is likewise the case with moraines, which, protecting the icy ridge that bears them along, are sometimes raised from fifty to eighty feet above the general level. The depression of surface in a glacier amounts in summer to a foot per week; thus the elevation of a block shows the height of a glacier at a former given period.

Mr. Forbes describes a block thus elevated upon the glacier de Léchaud, Mer de Glace; it was of granite, measuring 23 feet by 17, and about 3½ feet in thickness. When he first saw it in June, it was easily accessible, and he made observations from its summit on the movement of the ice. As the season advanced its appearance was changed; the glacier sunk all around it, while the ice under it appeared to rise, the stone becoming elevated on a pillar of ice beautifully veined; in August this was thirteen feet high, and but a few feet broad on the summit. In the end of that month the stone slipped from its pedestal, and when Mr. Forbes saw it again in September it was beginning to rise upon a new one, whilst the unmelted base of the first was still very visible upon the glacier.

Other singular appearances are "glacier cones," which are thus formed. Sand derived from moraines having been washed by superficial water courses into the deep cavities which are occasionally formed in the glacier, the accumulation is at length sufficient to check the progress of the waste of ice, and what was a hole filled with sand becomes a pyramid projecting above its surface, and coated with the protecting layer. These cones are often twenty feet in height, and eighty in circumference.

A contrary action is sometimes to be seen. Small objects of a dark colour, as particles of black sand, or even leaves, which are wafted by the wind from vast distances upon the glaciers, absorbing the solar heat, and transmitting it to the ice beneath, sink into the cavities they have made by melting the ice; whilst blocks weighing hundreds of tons float upon the surface.

Another occurrence is the formation of basins in the ice, thus.

"Water just freezing is lighter than water at a temperature somewhat higher; the water at 32°, therefore, floats on the surface of the other. Imagine a small cavity in ice, filled with water just thawed. The sun's rays first heat the surface of the water, which becoming denser, descends, and is replaced by water at 32°. But the water which subsided with a temperature, suppose of 36°, soon communicates its heat to the sides of the icy receptacle, and being cooled to 32°, it rises in its turn. The heat of the denser water is thus spent in melting the ice of the bottom of the cavity, which is thus deepened by the continual current."

Proceeding now upwards with the glacier, we arrive at the part where the snow never melts, which is called the *névé*. In the middle and lower part the snow as regularly disappears as it does from the surface of the ground in its neighbourhood. Even where it has fallen in a shady nook or deep crevasse, it never becomes ice, but, if remaining unmelted for a time, shows in its opaque, white appearance, the difference in its nature from the blue or bluish green transparent ice upon which it lies. The snow line or division of the *névé* from the true glacier surface, is where the latter begins to be annually renewed by the unmelted accumulation of each winter. The snow is of a dull white or greenish hue, but rarely exhibiting the transparency and colour of the

lower part of the glacier. The deeper parts are more perfectly congealed, and bands of ice show where a partial thaw has been succeeded by a frost. On exposed summits, where the action of the sun is greater, the snow does not lie so long in a powdery state, the surface becoming completely frozen. This is the case with the highest part of Mont Blanc and the Jungfrau.

We now approach the most interesting part of our subject—erratic blocks or boulder stones. Speaking at present of Switzerland only, these are found in such positions, and composed of such materials, as to give room for the conjecture, that, in times of which we can but dream, the glaciers were not, as now, confined to Alpine districts, but that the valley of the Rhone, the lakes of Geneva and Neuchâtel, were once vast glaciers, fed by the same snows as now feed the smaller ice streams, which so worthily raise our wonder, and bearing with them in their resistless course tokens of their distant origin. The Jura chain lies nearly parallel to the Alps, and upon the slope of its mountains, considerably above the lake of Neuchâtel, and just facing the valley of the Rhone, lie “extensive deposits of angular blocks of the kind of granite which especially characterizes the eastern part of the range of Mont Blanc, which is also the nearest point where the rock in question occurs in a natural state.” This kind of granite is common in many parts of the Alps, but it is certain that no rock approaching to it in the slightest degree is to be found either in the Jura, or nearer than the part of the Alps above mentioned, which is about sixty or seventy miles distant in a straight line. “A great belt of these blocks occupies a line extending for miles, at an average height of 800 feet above the level of the lake of Neuchâtel, and above and below that line they diminish in number, although not entirely wanting. Many are concealed among the woods; many have been broken up and removed for building and other purposes. The most notable of these masses, called the *Pierre à Bot* (load-stone), lies in a belt of wood, within two miles of Neuchâtel. It is 50 feet long, 20 wide, and 40 high. It cannot be regarded without emotion when we recollect that it has been brought by some powerful agent, now only guessed at, from those lofty peaks which are visible by their perpetual snows. Upon the side of the Nîlo are hundreds and thousands of these travelled blocks, some small and rounded, others angular, without any appearance of having been brought thither with violence. That a glacier extending from the present ice field of Mont Blanc to the side of the Jura chain was the agent of the above transportation, is made probable by the marks of glacier wear and polish which are visible in the narrow gorge through which the Rhone passes at St. Maurice, especially on the rocks which occupy the bottom between the above place and Bex; these marks extend to a great height on the eastern side of the valley, where the polished surfaces of rock are as smooth as a schoolboy's slate, and display an artificial section of all the interior veins. Beyond the defile of Maurice are the “blocks of Mouthey,” as they are called, from the village immediately below them. They compose a belt of boulders, poised, as it were, on a mountain side, 500 feet above the alluvial flat through which the Rhone winds. It extends for miles along the mountain side; there are hundreds of blocks of granite, some sixty feet square, fantastically balanced on the angles of one another, while among and around them are the gnarled stems of ancient chestnut trees which have barely room to grow. The greater blocks are often piled on the smaller, leaving deep recesses between.

The valley of the Salenche likewise shows marks of glacier action: the vertical precipices are “scored by horizontal stripes, or grooves, or fluting, evidently the result of superficial wear. But what could have worn them in this position? Could a current of water, of 1500 feet deep, have borne boulders on its surface which should leave these plain horizontal markings? What could have been moved with a steady pressure as a car-

pentor presses his cornice plane on the wood, or as a potter moulds with a stick his clay, pressed laterally too, with a perpendicular fall of 1500 feet beneath? Nothing that I am acquainted with, save a glacier, which at this day presses and moulds and scores the rocky flanks of its bed, extending to a depth often certainly of hundreds of feet beneath. A torrent, however impetuous, —a river, however gigantic,—a flood, however terrific,—could never do this.”

The glacier of Allalein is remarkable. It crosses the valley with its moraine, damming up the river and forming a lake. The moraine supplies blocks containing Smaragdite, which are found on all the plains of Switzerland, and which have no native locality in the Alps but this. They are brought down by the glacier from the inaccessible heights of the Saasgrat, and are usually much rounded by attrition, notwithstanding their excessive hardness. The river passes under the glacier which has poured itself against the opposing side of the valley; the rock is soft, and the glacier has left vertical markings upon it, which were uncovered by its melting.

The head of the valley of Fée is bounded by a vast glacier, while the village, which is inhabited all the year, lies in a beautiful green hollow, amidst meadows and trees, which seem to touch the regions of ice. A few years ago, the glacier descended so as to threaten the destruction of the higher chalets and trees, and completely to obstruct the passages to an *alp* or pasture between two branches of the glacier which then closed round it. About 1834, the glacier began to retreat, and was, when Mr. Forbes saw it, at a very considerable distance from the chalets, which it had almost touched. In the whole of the lower part of the valley the rock is scooped out by horizontal grooves, perfectly continuous for some yards or fathoms, like elaborate chiselling. In the Val de Bagnes Mr. Forbes observed the difference between the effects of friction by ice and water. “The sides of one of the ravines through which the stream struggles is distinctly marked on its bold limestone surface by the long grooves which show the action of glaciers. Though the descent is very steep, and the wall of rock almost vertical, these chiselled and polished grooves are worn in a nearly horizontal, slightly declining direction, and are continuous for many yards or fathoms. Over these, on the very same surface, are the marks of wear, resulting from the action of floods, probably charged with great masses of debris. The water marks are rough and confused, quite in contrast with the smooth prolongation of the others. They also slope downwards at an angle similar to that of the river bed, whilst, as has been said, the others are nearly horizontal.”

So many accounts have been written by travellers of the difficulties and enjoyments experienced in visiting the glaciers of Chamouni, that it is unnecessary to say anything of the Mer de Glace and its icy tributaries; we will conclude our remarks with Mr. Forbes's account of his perilous passage of the Col d'Erin.

“Our object was now to descend upon the glacier of Zmutt, from which we were separated by a precipice which was blended with the glacier under a snowy sheet, besides which the glacier appeared dangerously crevassed. Praloug (the guide) proposed to attempt descending the cliff, by which he recollected to have passed when he last crossed, and to have successfully reached the glacier below. We began cautiously to descend, for it was an absolute precipice: Praloug first, I following, leaving the other guides to wait about the middle, until we could see whether or not a passage could be effected. The precipice was several hundred feet high. Some bad turns were passed, and I began to hope that no insurmountable difficulty would appear, when Praloug announced that the snow this year had melted so much more completely than on the former occasion, as to cut off all communication with the glacier, for there was a height of at least thirty vertical feet of rocky wall, which we could by no means circumvent. Thus, all was to do over again, and the cliff was re-as-

ended. We looked right and left for a more feasible spot, but described none. Having regained the snows above, we cautiously skirted the precipice, until we should find a place favourable to the attempt. At length the rocks became mostly masked under steep snow slopes, and down one of them, Praloug, with no common courage, proposed to venture, and put himself at once in the place of danger. We were now separated by perhaps but 200 feet from the glacier beneath. The slope was chiefly of soft deep snow, lying at a high angle. There was no difficulty in securing our footing in it, but the danger was of producing an avalanche by our weight. This, it may be thought, was a small matter, if we were to alight on the glacier below; but such a surface of snow upon rock rarely connects with a glacier without a break, and we all know very well that the formidable 'Bergschrund' crevasse, which I had seen from a distance with my telescope, was open to receive the avalanche and its charge, if it should take place. We had no ladder, but a pretty long rope. Praloug was tied to it. We all held fast on the rope, having planted ourselves as well as we could on the slope of snow, and let him down by degrees, to ascertain the nature and breadth of the crevasse, of which the upper edge usually overhangs like the roof of a cave, dropping icicles. Were that covering to fail, he might be plunged, and drag us, into a chasm beneath. He, however, effected the passage with a coolness which I have never seen surpassed, and shouted the intelligence that the chasm had been choked by previous avalanches, and that we might pass without danger. He then (having loosened himself from the rope) proceeded to explore the footing on the glacier, leaving me and the other two guides to extricate ourselves. I descended first by the rope, then Biona, and lastly Fairray, who, being unsupported, did not at all like the slide, the termination of which it was impossible to see from above. We then followed Praloug, and proceeded with great caution to sound our way down the upper glacier of Zmutt, which is here sufficiently steep to be deeply fissured, and which is covered with perpetual snow, now soft with the heat of the morning sun. It was a dangerous passage, and required many wide circuits. But at length we reached, in a slanting direction, the second terrace or precipice of rock which separates the upper and lower glacier of Zmutt, and which terminates in the promontory of Stockni. When we were fairly on the debris, we stopped to repose, and to congratulate ourselves on the success of this difficult passage."

FALL OF THE ROSSBERG.¹

I SHALL here give some of the most authentic and interesting circumstances of the fall of the Rossberg, taken from the narrative published at the time by Dr. Zay, of Art, an eye-witness:—

"The summer of 1806 had been very rainy; and on the first and second of September it rained incessantly. New crevices were observed in the flank of the mountain; a sort of cracking noise was heard internally; stones started out of the ground; detached fragments of rocks rolled down the mountain. At two o'clock in the afternoon, on the second of September, a large rock became loose, and in falling raised a cloud of black dust. Toward the lower part of the mountain, the ground seemed pressed down from above; and when a stick or a spade was driven in, it moved of itself. A man, who had been digging in his garden, ran away from fright at these extraordinary appearances; soon a fissure, larger than all the others, was observed; insensibly, it increased; springs of water ceased all at once to flow; the pine-trees of the forest absolutely reeled; birds flew away screaming. A few minutes before five o'clock, the symptoms of some mighty catastrophe became still stronger; the whole surface of the mountain seemed to glide down, but so slowly as to afford time to the in-

habitants to go away. An old man, who had often predicted some such disaster, was quietly smoking his pipe, when told, by a young man running by, that the mountain was in the act of falling; he rose and looked out, but came into his house again, saying he had time to fill another pipe. The young man, continuing to fly, was thrown down several times, and escaped with difficulty; looking back, he saw the house carried off all at once.

Another inhabitant, being alarmed, took two of his children and ran away with them, calling to his wife to follow with the third; but she went in for another, who still remained (Marianne, aged five); just then, Francisca Ulrich, their servant, was crossing the room with this Marianne, whom she held by the hand, and saw her mistress; at that instant, as Francisca afterwards said, "the house appeared to be torn from its foundation, (it was of wood,) and spun round and round like a teetotum; I was sometimes on my head, and sometimes on my feet, in total darkness, and violently separated from the child." When the motion stopped, she found herself jammed in on all sides, with her head downwards, much bruised, and in extreme pain. She supposed she was buried alive at a great depth; with much difficulty she disengaged her right hand, and wiped the blood from her eyes. Presently, she heard the faint moans of Marianne, and called her by her name; the child answered that she was on her back, among stones and bushes, which held her fast, but that her hands were free, and that she saw the light, and then something green; she asked whether people would not come soon to take them out.

Francisca answered that it was the day of judgment, and that no one was left to help them, but that they would be released by death, and be happy in Heaven. They prayed together; at last Francisca's ear was struck by the sound of a bell, which she knew to be that of Stenberg; then seven o'clock struck in another village, and she began to hope there were still living beings, and endeavoured to comfort the child; the poor little girl was at first clamorous for her supper, but her cries soon became fainter, and at last quite died away. Francisca, still with her head downwards, and surrounded with damp earth, experienced a sense of cold in her feet almost insupportable; after prodigious efforts, she succeeded in disengaging her legs, and thinks this saved her life. Many hours had passed in this situation, when she again heard the voice of Marianne, who had been asleep, and now renewed her lamentations. In the meantime the unfortunate father, who with much difficulty had saved himself and two children, wandered about till daylight, when he came among the ruins to look for the rest of his family; he soon discovered his wife, by a foot which appeared above ground; she was dead, with a child in her arms. His cries and the noise he made in digging, were heard by Marianne, who called out. She was extricated with a broken thigh, and saying that Francisca was not far off, a further search led to her release also, but in such a state, that her life was despaired of. She was blind for some days, and remained subject to convulsive fits of terror. It appeared that the house, or themselves at least, had been carried down about one thousand five hundred feet from where it stood before.

In another place a child two years old was found unhurt, lying on his straw mattress upon the mud, without any vestige of the house from which he had been separated. Such a mass of earth and stones rushed at once into the lake of Sowerter, although five miles distant, that one end of it was filled up, and a prodigious wave passing completely over the island of Schwanau, seventy feet above the usual level of the water, overwhelmed the opposite shore, and as it returned swept away into the lake many houses with their inhabitants. The chapel of Oisen, built of wood, was found half a league from the place it had previously occupied, and many large blocks of stone completely changed their position.

(1) From *Simond's Switzerland*.

Biographical Sketches of Eminent Painters.

CLAUDE GELÉE DE LA LORRAINE.

THE name of Claude is ever associated in the mind with the idea of beautiful landscape scenery, glowing skies, brilliant sunset, and soft moonlight. His native place was Chamagne, in La Lorraine, which was formerly a sovereign Duchy, but was afterwards annexed to France.

Claude was born in 1600, and in the early part of his life, during which he served an apprenticeship to the trade of a pastry-cook, he did not give any promise of that surprising genius which afterwards delighted the world.

Claude de la Lorraine was but little indebted to any master, excepting to Agostino Tassi, an eminent Italian painter, and a disciple of Paul Bril, who, though a Fleming, had studied at Rome. Agostino Tassi taught Claude some of the rules of perspective, and the method of preparing his colours.

It required great labour at first to make him comprehend the rudiments of the art, but when he began to understand them, his mind seemed at once to expand, his imagination became lively, and he pursued his studies with ardour and perseverance.

He devoted himself to the examination of the beauties and varieties of nature with unwearied assiduity, and for that object he frequently remained in the open fields from sun-rise until evening closed in. He made a practice of sketching whatever he considered beautiful or striking, and he marked in his drawings every curious tinge of light, on all kinds of objects, with a corresponding colour. By these means he perfected his landscapes, and gave them an appearance of reality, which no artist in that style ever equalled. He painted with great care, and spared no pains to render his pictures as true to nature as possible.

Claude de la Lorraine was remarkable for the exactness with which he painted in fresco; the distinct species of every tree being easily perceived in his large compositions. One of his works in that manner of painting, was on the four walls of a magnificent saloon at Rome, in the mansion of a nobleman named Mutius. The saloon was very lofty.

On one side the artist represented the ruins of an ancient palace, and an extensive grove of trees; the form, stems, bark, branches and foliage, were beautifully delineated, and the perspective was admirable. The second side of the saloon, which seemed to be a continuation of the same scene, displayed a vast plain, interspersed with mountains and waterfalls, and a variety of trees and plants. Travellers and animals gave additional life to this picture, which appeared to be connected with the third side, on which the lengthened prospect discovered a sea-port at the foot of some high hills, with a view of the ocean, and vessels tossed on the agitated waves. On the fourth wall were caverns among barren rocks, ruins, and fragments of antique statues. This composition, though divided into so many parts, formed one connected prospect, and it has been said that no power of language could sufficiently express the beauty, truth, and variety of it.

Claude did not excel in drawing figures, and usually engaged some eminent artist to paint them

for him, in his pictures; but, whatever may have been his deficiency in that respect, his delicate and varied colouring, his warm and brilliant skies, his excellent taste, and correct representation of the beauties of nature, have caused his works to be sought for with avidity, as gems of the highest value.

The writer of this sketch possesses a characteristic engraving from a valuable picture by Claude, in the Museo of Madrid, where there are several excellent paintings of this much admired artist.

It represents a noble sea-port, and on the mole or pier are a great number of figures, among which Santa Paula Romana is conspicuous. She is descending the steps, and is leaning on a youth, whilst others are waiting to receive her gifts of charity.

On the right of the spectator is seen a beautiful palace adorned with statues, and gardens, terminated by a castle for the defence of the entrance to the harbour.

In the centre is the sea, which extends to the verge of the horizon, and is covered with vessels, barges, and boats, filled with people. On the left, the principal object is part of a vast temple, or public edifice, and there are also mansions of elegant construction, and redoubts for the protection of the merchandize deposited in the warehouses. These buildings extend as far as the pharos at the entrance of the port.

The effect of this picture is charming; the hour is shortly after sun-rise; the sky is clear, the rays of the sun are reflected on the surface of the water, and the rise and fall of the rippling waves could not be more beautifully imitated.

The composition of this interesting picture, in which the figures are by Claude himself, is delightful; every object is represented in its true character, and all parts harmonize with each other. Claude was fond of painting subjects of this nature, and there are some beautiful pictures of a similar description, executed by him, to be seen in the National Gallery in London.

Claude de la Lorraine died at Rome, in 1682, aged eighty-two.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

DORA.

WITN farmer Allan at the farm abode
William and Dora. William was his son,
And she his niece. He often look'd at them,
And often thought, "I'll make them man and wife."
Now Dora felt her uncle's will in all,
And yearn'd towards William; but the youth, because
He had been always with her in the house,
Thought not of Dora.

Then there came a day
When Allan call'd his son, and said, "My son,
I married late, but I would wish to see
My grandchild on my knees before I die;
And I have set my heart upon a match:
Now therefore look to Dora; she is well
To look to; thrifty too beyond her age.
She is my brother's daughter: he and I
Had once hard words, and parted, and he died
In foreign lands; but for his sake I bred
His daughter Dora: take her for your wife;
For I have wish'd this marriage, night and day,
For many years." But William answer'd short:

"I cannot marry Dora; by my life,
I will not marry Dora." Then the old man
Was wroth, and doubled up his hands, and said:
"You will not, boy! you dare to answer thus!
But in my time a father's word was law;
And so it shall be now for me. Look to't;
Consider, William: take a month to think,
And let me have an answer to my wish;
Or, by the Lord that made me, you shall pack,
And never more darken my doors again."
But William answer'd madly; bit his lips,
And broke away. The more he look'd at her,
The less he liked her; and his ways were harsh;
But Dora bore them meekly. Then before
The month was out, he left his father's house,
And hired himself to work within the fields;
And half in love, half spite, he woo'd and wed
A labourer's daughter, Mary Morrison.
Then, when the bells were ringing, Allan call'd
His niece, and said: "My girl, I love you well;
But if you speak with him that was my son,
Or change a word with her he calls his wife,
My home is none of yours. My will is law."
And Dora promised, being meek. She thought,
"It cannot be: my uncle's mind will change!"
And days went on, and there was born a boy
To William; then distresses came on him;
And day by day he pass'd his father's gate,
Heart-broken, and his father help'd him not.
But Dora stored what little she could save,
And sent it them by stealth, nor did they know
Who sent it; till at last a fever seized
On William, and in harvest time he died.
Then Dora went to Mary: Mary sat
And look'd with tears upon her boy, and thought
Hard things of Dora. Dora came and said:
"I have obeyed my uncle until now,
And I have sinn'd, for it was all through me
This evil came on William at the first.
But, Mary, for the sake of him that's gone,
And for your sake, the woman that he chose,
And for this orphan, I am come to you.
You know there has not been for these five years
So full a harvest: let me take the boy,
And I will set him in my uncle's eye
Among the wheat; that when his heart is glad
Of the full harvest, he may see the boy,
And bless him for the sake of him that's gone."
And Dora took the child, and went her way
Across the wheat, and sat upon a mound
That was unsown, where many poppies grew.
Far off the farmer came into the field
And spied her not; for none of all his men
Dare tell him Dora waited with the child;
And Dora would have risen and gone to him,
But her heart fail'd her; and the reapers reap'd,
And the sun fell, and all the land was dark.
But when the morrow came, she rose and took
The child once more, and sat upon the mound,
And made a little wreath of all the flowers
That grew about, and tied it round his hat,
To make him pleasing in her uncle's eye.
Then when the farmer pass'd into the field
He spied her, and he left his men at work,
And came and said: "Where were you yesterday?
Whose child is that? What are you doing here?"
So Dora cast her eyes upon the ground,
And answered softly, "This is William's child."
"And did I not," said Allan, "did I not
Forbid you, Dora?" Dora said again,
"Do with me as you will, but take the child;
And bless him for the sake of him that's gone!"
And Allan said, "I see it is a trick
Got up betwixt you and the woman there.
I must be taught my duty, and by you!
You knew my word was law, and yet you dared
To slight it. Well—for I will take the boy;
But go you hence, and show me no more."
So saying, he took the boy, and went about,
And struggled hard.—The women of the field
At Dora's feet. She bow'd down her hands,
And the boy's cry came to her from the field,
Dora and more distant. She bow'd down her head,
Remembering the day when first she came.

And all the things that had been. She bow'd down
And wept in secret; and the reapers reap'd,
And the sun fell, and all the land was dark.
Then Dora went to Mary's house, and stood
Upon the threshold. Mary saw the boy.
Was not with Dora. She broke out in praise
To God, that help'd her in her widowhood.
And Dora said, "My uncle took the boy;
But, Mary, let me live and work with you;
He says that he will never see me more."
Then answer'd Mary, "This shall never be,
That thou shouldst take my trouble on thyself.
And, now I think, he shall not have the boy,
For he will teach him hardness, and to slight
His mother; therefore thou and I will go,
And I will have my boy, and bring him home;
And I will beg of him to take thee back;
But if he will not take thee back again,
Then thou and I will live within one house,
And work for William's child, until he grows
Of age to help us."

So the women kiss'd
Each other, and set out, and reach'd the farm.
The door was off the latch; they peep'd and saw
The boy set up betwixt his granduncle's knees,
Who thrust him in the hollows of his arm,
And clapt him on the hands and on the cheeks,
Like one that loved him; and the lad stretch'd out,
And babbled for the golden seal, that hung
From Allan's watch, and sparkled by the fire.
Then they came in: but when the boy beheld
His mother, he cried out to come to her;
And Allan set him down, and Mary said:
"O father!—if you let me call you so—
I never came a-begging for myself,
Or William, or this child; but now I come
For Dora: take her back; she loves you well.
O Sir, when William died, he died at peace
With all men; for I ask'd him, and he said,
He could not ever rue his marrying me,
I had been a patient wife: but, Sir, he said
That he was wrong to cross his father thus.
'God bless him!' he said, 'and may he never know
The troubles I have gone through!' Then he turn'd
His face and pass'd—unhappy that I am!
But now, Sir, let me have my boy, for you
Will make him hard, and he will learn to slight
His father's memory; and take Dora back,
And let all this be as it was before."
So Mary said, and Dora hid her face
By Mary. There was silence in the room;
And all at once the old man burst in sobs:—
"I have been to blame—to blame. I have kill'd my son.
I have kill'd him—but I loved him—my dear son.
May God forgive me!—I have been to blame.
Kiss me, my children."

Then they clung about
The old man's neck, and kiss'd him many times.
And all the man was broken with remorse;
And all his love came back a hundred-fold;
And for three hours he sobb'd o'er William's child,
Thinking of William.

So those four abode
Within one house together; and as years
Went forward, Mary took another mate;
But Dora lived unmarried till her death.

Tennyson.

Legend of Sir Morolt and the Stuart Huntsman.

LEGEND OF SIR MOROLT AND THE SWART HUNTSMAN.

AN OLD ENGLISH STORY.

SIR MOROLT LAMANELEY he prays of the King
 ("Twas the wild reckless Rufus,) to grant him a thing,
 "The lands of St. Juste, be they mine for a chase,
 While the pale mumping hoodman is driven from his
 place."

Loud laugh'd the Red Monarch as blithe brimmed the
 bowl,

"Twas a prayer to his liking, a man to his soul;
 With bell, book, and candle, the beadsmen may curse,
 But the lands are Sir Morolt's for better and worse.

With a spur red with speed, with a plume stained with
 dust.

Sir Morolt rides on to the towers of St. Juste;
 With him are squire, yeoman, and henchman, and
 groom,
 All wild for the plunder of temple and tomb.

"Speed on, my stout vassals, we'll wassail to-night,
 On the wine of the Sacrament, ruddy and bright.
 Speed on, my bold comrades, on chalice and pyx
 To-night as the spoil of our valour we'll fix."

Gallop, gallop, their steeds speed o'er dingle and dell;
 Gallop, gallop, they stable in chapel and cell;
 The Knight's hands from the altar the shrined image tear,
 And scornfully lead up his paramour there.

As the hawk recks the heathcock, the hound recks the hare,
 So his men-at-arms reek men of shrift and of prayer.
 "Dull Churchmen, avaunt! Abbey-lubbers, away!
 And yield up your spoils to the gallant and gay."

The fierce jackman's oath drowns the ave and creed,
 The clanging of harness the bidding of head;
 Wrath and uproar, blent with fear, trembling, and woe,
 As the pale hoodsmen flee from the mail-suited foe.

Sole lingered the Abbot, a stern man was he;
 "From a spot so unhallowed all good angels flee;
 Ye have seized on our lands as your portion; beware
 Of the day when the fiends in these lands claim a
 share."

Then loud laugh'd Sir Morolt; he laugh'd out with
 scorn.

"Who recks of the ban of the landless and lorn?
 Avaunt with thy shavelings, I reek not thy curse,
 But thy broad lands, I hold them for better and worse."

Light tinkles the lute where the shorn beadman knelt,
 Loud clanks the red wine cup where missals were spelt,
 And instead of the chime of the organ and bell,
 There is banquet-house minstrelsy, wild bugle swell.

Wild life led Sir Morolt, his knights and his squires,
 While they quaffed the red wine from the skulls of the
 friars.

And now from the rich golden chalice, that's torn
 From the altar where lately it glittered, in scorn.

Now afoot are strange murmurs, strange whispers afloat
 On the chase of St. Ruth, how scared peasants note
 Other huntsmen than who to Sir Morolt belong,
 Yet they hunt on his manors, all reckless of wrong.

Swart are those strange huntsmen, and swart, swart
 their hounds,

And hollow and dreary their wild bugle sounds;
 No bandit so grimly, no lazar so foul,
 But liker the fiends that midst hell's torments howl.

They are seen in the midnight, and lated hinds quail;
 They are seen in the twilight, and maidens turn pale;
 They are seen at broad noontide, and armed men change
 Their cheer at the sight of a portent so strange.

Still nearer and nearer (in God be our trust!)
 Grows the wild bugle blast to the towers of St. Juste.
 From his banquet Sir Morolt has sprung up in haste,
 To take rule with the strangers his manors who waste.

"How dare ye, churls, hunt in my chase hind or hart?"
 Loud, loud laugh'd the strangers so grimly and swart;
 "The chase is our chase; to the fiends it was given
 When you drove forth in terror the servants of heaven!"

In wrath, at the crew rode Sir Morolt amain;
 But, snorting, his steed started back from the train.
 "Twixt a cross, that his own hands broke down, and a
 stone

The Pagan Dane worshipped, Sir Morolt is thrown!

His life-blood empurples the cross he profaned;
 With his life-blood the demon-god's cromlech is stained;
 While a terrible mort-note the swart huntsmen wound,
 And with shouts of fiend triumph their jubilee crowned.

Knight, squire, leman, groom, from St. Ruth's fly as fast
 As the churchmen, so holy, whom late forth they cast!
 And the gay banquet-house has a ruin become,
 Where the bat and the owl alone find a home.

'Tis said, near the spot where Sir Morolt was slain,
 There is glimpse of the swartly and fiend-looking train;
 And 'tis whispered, among them Sir Morolt is seen,
 With deep spots of blood on his stained weeds of green.

Of the cross and the stone of the Pagan beware,
 Lest the swart demon huntsman thy glance should meet
 there;

Now seen in the bright broad noontide, now in shade
 The twilight such visions more fearful has made.

Last, hear ye my moral, nor hear with a smile—
 Beware how the Church of her lands you despoil;
 Sir Morolt, King Rufus—remember their doom,
 How bloody their deaths, how unhonoured their tomb!

FRANK FAIRLEGH;

OR, OLD COMPANIONS IN NEW SCENES.

By F. E. S.

CHAP. IV.

RINGING THE CURFEW.

As we proceeded through the town, Lawless, despite our endeavours to restrain him, chose to vent his superabundant spirits by performing sundry feats at the expense of the public, which, had the police regulations of the place been properly attended to, would have assuredly gained us a sojourn in the watch-house. We had just prevailed upon him to move on, after singing "We won't go home till morning" under the windows of "the Misses Properprim's Seminary for Young Ladies," when a little shrivelled old man, in a sort of watchman's white great coat, bearing a horn lantern in his hand, brushed past us, and preceded us down the street at a kind of shuffling trot.

"Holloa!" cried Lawless, "who's that old picture of ugliness? Look what a pace the beggar's cutting along at; what on earth's he up to?"

"That's the sexton and bell-ringer" returned Coleman; "they keep up the old custom at Hillingford of ringing the Curfew at day-break, and he's going to do it now, I suppose."

"What jolly fun!" said Lawless, "come on, and let's see how the old cock does it;" and, suiting the action to the word, off he started in pursuit.

"We'd better follow him," said I; "he'll be getting into some mischief or other, depend upon it."

After running a short distance down the street, on turning a corner, we found Lawless standing under a small arched door-way leading into a curious old battlemented tower, which did not form part of any church or other building of the same date as itself, but stood alone, showing, as it reared its time-worn head high above the more modern dwellings of which the street was composed, like some giant relic of the days of old. This tower contained a peal of bells, the fame of which was great in that part of the country, and of which the townspeople were justly proud.

"All right!" cried Lawless, "the old scare-crow ran in here like a lamp-lighter, as soon as he saw me howling after him, and has left the key in the lock; so I shall take the liberty of exploring a little: I've a strong though uncultivated taste for architectural antiquities. Twopence more, and up goes the donkey I come along!"

So saying, he flung open the door, and disappeared up some steps leading to the interior of the tower, and, after a moment's hesitation, Coleman and I followed him.

"Don't be alarmed, old Boy!" said Lawless, patting the sexton (who looked frightened out of his wits at our intrusion) so forcibly on the back, as to set him coughing violently, "we're not come to murder you for the sake of your lantern."

"This gentleman," said Coleman, who by the cunning twinkle of his eye was evidently becoming possessed by the spirit of mischief, "has been sent down by the Venerable Society of Antiquaries, to ascertain whether the old custom of ringing the Curfew is properly performed here. He is, in fact, no other than the Noble President of the Society himself. That gentleman (pointing to me) is the Vice-President, and I, who have the honour of addressing you, am the unworthy Secretary."

"That's it, Daddy," resumed Lawless, coolly taking up the lantern, and lighting a cigar, "that's the precise state of the poll, I mean case; so now go to work, and mind you do the trick properly."

Thus adjured, the old man, who appeared completely bewildered by all that was going on, mechanically took hold of a rope, and began slowly and at stated intervals tolling one of the bells.

"Where are your assistants, my good man?" inquired Coleman after a short pause.—The only answer was a stare of vacant surprise, and Coleman continued, "Why, you don't mean to say you only ring *one* bell, to be sure? oh, this is all wrong;—what do you say, Mr. President?"

"Wrong?" replied Lawless, removing the cigar from his mouth, and puffing a cloud of smoke into the sexton's face, "I should just think it was most particularly and confoundedly wrong. I'll tell you what it is, old death's-head and cross-bones; things can't be allowed to go on in this manner. Reform, sir, is wanting, 'the bill, the whole bill, and nothing but the bill.' I mean to get into Parliament some day, Fairleigh, when I am tired of knocking about, you know—but that wasn't exactly what I was going to say."

"Suppose we show him the proper way to do it, Mr. President!" suggested Freddy, catching hold of the rope of one of the bells. "Off she goes," cried Lawless, seizing another.

"Gentlemen, good gentlemen, don't ring the bells, pray," implored the old man, "you'll raise the whole town; they are never rung in that way without there's a fire, or something dreadful the matter."

But his expostulations were vain. Lawless had already begun ringing his bell in a manner which threatened to stun us all, and Coleman, saying to me, "Come, Frank, we're regularly in for it, so you may as well take a rope and do the thing handsomely while we are about it; it would be horribly shabby of you to desert us now," I hastened to follow his example.

Now it must be known that, when I arrived at the inn, before supper, owing probably to a combination of the fatigue of the day, the excitement of the evening, and the pain of my arm, I felt somewhat faint and exhausted, and should have greatly preferred going at once quietly to bed; but, as I was aware that by so doing I should break up the party, I resolved to keep up as well as I could, and say nothing about it. Finding myself refreshed by the bottled porter, I repeated the dose several times, and the remedy continuing to prove efficacious, without giving me the thing a thought, I drank more deeply than was my wont, and was a good deal surprised, when I rose to accompany the others, to discover that my legs were slightly unsteady, and my head not so clear as usual. Still I had been far from approving the proceedings of my companions, and, had any one told me, when I entered the tower, that I was going to ring all the good people of Hillingford out of their beds in a fright, I should indignantly have repelled the accusation. Now, however, owing to the way in which Coleman had requested my assistance, it appeared to my bewildered senses that I should be meanly deserting my friends the moment they had got into difficulties, if I were to refuse; but, when he used the word "shabby," it settled the business, and, seizing a rope with my uninjured hand, I began pulling away vigorously.

"Now then, you wretched old man," shouted Lawless, "don't stand there winking and blinking like an owl; pull away like bricks, or I'll break your neck for you; go to work, I say!" and the miserable sexton, with a mute gesture of despair, resuming his occupation, a peal of four bells was soon ringing bravely out over hill and dale, and making 'night horrible' to the startled inhabitants of Hillingford.

After the lapse of a few minutes, a distant shout was heard; then a confused noise of people running and calling to each other in the street reached our ears; and lastly the sound of several persons rapidly approaching the bell tower became audible.

"We're in for a scrimmage now, I expect," said Lawless, leisurely turning up his sleeves.

"Not a bit of it," replied Freddy, "only leave it to me, and you'll see. All you fellows have got to do is to hold your tongues, and keep on ringing away till your arms ache; trust me to manage the thing all right. Lawless, keep your eye on ancient Methuselah there, and if he

offers to say a word, just knock him head over heels by accident, will you?"

"Aye, aye, sir," replied Lawless, shaking his fist significantly at the sexton.

At this moment a short fat man, with a very red face (who we afterwards learnt was no less a person than the Mayor of Hillingford in his public, and a mighty tallow-chandler in his private capacity) appeared, attired in a night-shirt and cap, and bearing the rest of his wardrobe under his arm, followed by several of the townspeople, all in a singular state of undress, and with the liveliest alarm depicted on their countenances. The worthy Mayor was so much out of breath with his unwonted exertions, that some seconds elapsed before he could utter a word, and in the meantime we continued ringing as though our lives depended upon it. At length he contrived to gasp out a hurried inquiry (hardly audible amidst the clanging of the bells) as to what was the matter. To this Coleman replied, by pointing with one hand to a kind of loop-hole, of which there were several for the purpose of supplying light and air to the interior of the tower, while with the other hand he continued ringing away more lustily than before.

"Bless my soul!" exclaimed the Mayor, raising himself on tip-toe, and stretching his short neck in a vain endeavour to peep through the loop-hole, "it must be a fire in West-street!"

Two or three of the bye-standers immediately rushed into the street, calling out "A fire in West-street! send for the engines."

At this moment Freddy caught the eye of a tall gaunt-looking man in a top boot and plush breeches, but without coat or waistcoat, and wearing a gold-laced cocked-hat on his head, hind part before, from beneath which peeped out a white cotton night-cap. Having succeeded in attracting the attention of this worthy, who in his proper person supported the dignity of Parish Beadle, Coleman repeated the same stratagem he had so successfully practised upon the Mayor, save that in this instance he pointed to a loop-hole in a completely opposite direction to the one he had indicated previously. The Beadle immediately ran out, muttering ere he did so, "I was certain sure as they was all wrong."—In another minute we heard him shouting "It's in Middle-street, I tell you, there's a fire in Middle-street!"

Coleman now turned to the Mayor, who having somewhat recovered his breath, was evidently preparing to question the Sexton as to the particulars of the affair, and exclaimed in a tone of deep feeling, "I am surprised to see a person of your respectability standing idle at a moment like this! take a rope, sir, and lend a hand to assist us, if you be a man."

"To be sure, to be sure," was the reply, "any thing for the good of the town," and grasping an unoccupied rope, he began pulling away with all his might.

The hubbub and confusion now became something unparalleled,—people without number kept running in and out of the tower, giving and receiving all kinds of contradictory orders; volunteers had been found to assist us, and the whole peal of eight bells was clashing and clanging away above the tumult, and spreading the alarm farther and wider; men on horseback were arriving from the country, eager to render assistance; women were screaming, dogs barking, children crying; and, to crown the whole, a violent and angry debate was being carried on by the more influential members of the crowd, as to the quarter in which the supposed conflagration was raging,—one party loudly declaring it was in Middle-street, while the other as vehemently protested it was in West-street.

The confusion had apparently attained its highest pitch, and the noise was perfectly deafening, when suddenly a shout was raised, "The engines! clear the way for the engines!" and in another moment the stampeding of the crowd in all directions, the galloping of horses' feet, and the rattle of wheels, announced their approach. While all this was going on, Coleman had

contrived silently and unperceived to substitute two of the bye-standers in my place and his own, so that Lawless was now the only one of our party actually engaged in ringing. Seizing the moment therefore when the shout of "the Engines!" had attracted the attention of the loiterers, he touched him on the shoulder saying, "Now's our time, come along," and joining a party who were going out, we reached the door of the bell-tower unnoticed.

The scene which presented itself to our view, as we gained the open street, would require the pencil of a Wilkie, or the pen of a Dickens, to describe. The street widened in front of the bell-tower, so as to make a kind of square. In the centre of the space thus formed stood the fire-engine drawn by four post-horses, the post-boys sitting erect in their saddles, ready to dash forward the moment the fire-men (who in their green coats faced with red, and shining leather helmets, imparted a somewhat military character to the scene) should succeed in ascertaining the place at which their assistance was required. The crowd, which had opened to admit the passage of the engine, immediately closed round it again, in an apparently impenetrable phalanx, the individual members of which afforded as singular a variety of costume as can well be imagined, extending from the simple shirt of propriety to the decorated uniforms of the fire-brigade. As every one who had an opinion to give was bawling it out at the very top of his voice, whilst those who had none contented themselves by shouting vague sentences having no particular meaning of any kind, the noise and tumult were such as beggared description. There was one short stout red-faced little fellow, (for I succeeded in catching sight of him at last,) with a mouth of such fearful dimensions that when it was open the upper half of his head appeared a mere lid, whose intellects being still partially under the dominion of sleep, evidently imagined himself at the Election, which had taken place a short time previously, and continued strenuously vociferating the name of his favourite candidate, though the cry of "Jenkins for ever!" did not tend greatly to elucidate matters. Suddenly, and at the very height of the confusion, the bells ceased ringing, and for a moment, as if influenced by some supernatural power, the crowd to a man became silent.

The transition from the Babel of sounds I have been describing to such perfect tranquillity was most striking, and impressed one with an involuntary feeling of awe. I was aroused by Coleman, who whispered in an under tone, "The Sexton has peached, depend upon it, and the sooner we're off the better." "Yes, and I'll go in style too; so good bye, and take care of yourselves," exclaimed Lawless, and, springing forward, before any one was aware of his intention, he fought his way through the crowd, overturning sundry members thereof in his progress, until he reached the fire-engine, upon which he seated himself with a bound, shouting as he did so—"Forward, forward, do you want the place to be burnt to the ground? I'll show you the way; give 'em the spur; faster, faster, straight on till I tell you to turn—faster I say!! The appearance of authority, coupled with energy and decision, will usually control a crowd. The fire-men, completely taken in by Lawless's manner, reiterated his orders; the post-boys applied both whip and spur vigorously,—the horses dashed forward, and, amidst the enthusiastic cheering of the mob, the engine disappeared like a flash of lightning. "Well, I give the Honourable George credit for that," exclaimed Coleman, as soon as we had a little recovered from our surprise at Lawless's elopement with the fire-engine, "it was a good idea, and he worked it out most artistically; the air with which he waved his hat to cheer them forward, was quite melo-dramatic. I've seen the thing not half so well done by several of the greatest generals who ever lived,—gallant commanders, whom their men would have followed through any amount of the reddest possible fire during the whole of Antley's

campaigns, that is, if the commissariat department (consisting of the pot-boy stationed in the fly, with the porter,) did its duty efficiently." "Freddy, they're beginning to come out from the bell-tower," interrupted I, "we shall be called upon to answer for our misdeeds, if we stay much longer; see, that long man in the cocked hat is coming towards us." "So he is," returned Coleman, "it strikes me they've found us out; follow me, and try and look as if it wasn't you, as much as possible, will you?" So saying, he began quietly to make his way out of the crowd unperceived, an example I hastened to follow; but we were not destined to effect our purpose quite so easily. The point Coleman wished to gain, was the arched gate-way leading into a stable-yard, from which he hoped, by a foot-path across some fields, to reach without molestation the inn where I was to sleep. But, in order to effect this, we were obliged to pass the door of the bell-tower, from which several people, who seemed angry and excited, were now issuing. The foremost of these, the cocked-hatted official previously mentioned, made his way up to us, exclaiming as he did so, "Here, you young gentlemen, just you stop a bit, will yer? His Wussnup, the Mayor, seems to begin to think as somebody's been a making a fool of him." "A very natural idea," returned Coleman; "I only wonder it's never occurred to him before; as far as my limited acquaintance with him will allow me to judge, the endeavour appears to have been perfectly successful. I wish you a very good morning." "That's all very fine, but I must trouble yer to come along o'me; his Wussnup wants to speak to yer," replied the Beadle, seizing Coleman by the coat-collar.—"That is a pleasure, his 'Wussnup must contrive to postpone till he has caught me," answered Freddy, as with a sudden jerk he succeeded in freeing himself from his captor's grasp, while, almost at the same moment, he dealt him a cuff on the side of the head, which sent him reeling back to the door of the bell-tower, where encountering the Mayor, who had just made his appearance, he came headlong to the ground, dragging that illustrious functionary down with him in a frantic endeavour to save himself. Profiting by the confusion which followed, Freddy and I sprang forward, darted through the arch-way, and, making the best use of our legs, soon found ourselves in the open fields, and quite beyond the reach of pursuit.

FROST ON THE WINDOW-PANES.

To him who has cultivated his perception of the beautiful, there is always something in nature to arrest attention, and to afford instruction. To him the desolation of winter is relieved by innumerable beauties: he enters into the "treasures of the snow;" he inquires whence comes the ice, and "the hoary frost of heaven who hath gendered it?" when "the waters are hid as with a stone, and the face of the deep is frozen." What, for example, can be more beautiful than the light feathery foliage which the slow and silent hand of winter paints upon our windows while we sleep? It is one of the delights of childhood to gaze on this white fairy forest; nor need we regard it with minor interest now, if we are ready to apply a few scientific principles to its examination.

It is perhaps remarkable that this subject, so well calculated to arrest attention by its variety and beauty, has scarcely been noticed by the scientific writers of this country; and on the continent we are only aware of two—De Mairan and Carena—who have attempted to investigate it.

De Mairan, residing in the southern part of France, had not many opportunities of witnessing the phenomenon in question; but, happening to be in Paris in January, 1729, towards the end of a long frost, he noticed, one morning,

upon the panes of a window facing the east, some beautiful spiral scrolls of foliage, similar to those used in architecture, or on damask. The forms were not very well defined, and the intervals between the curves were, in some places, occupied by a kind of frosty dust. In about an hour the whole melted away. On the next morning, however, these figures were more perfectly developed; the branches were composed of small white oval crystals of remarkable hardness. Five or six panes were ornamented with these figures, each pane measuring $6\frac{1}{2}$ inches by $5\frac{1}{2}$. From the corner of one of the panes proceeded a sort of stem, which branched out as far as the lead-work, the curves being continued to the adjoining panes.

The reader is, of course, aware that the frost-work on our window panes is deposited from the vapour floating in the air of the bed-room upon the inner surface of the glass, whenever the cold on the outside is sufficient to reduce the temperature of the glass below the freezing point; but the forms assumed by the vapour in freezing are not so easily accounted for. De Mairan supposed that these forms already exist in the glass, and are produced by the various twistings and turnings which glass undergoes in the process of manufacture, while yet in a fluid state; that certain minute furrows are thus formed in which the vapour first collects and freezes, and so determines the outline, which is afterwards filled up by successive accumulations of frozen vapour.

In answer to this explanation M. Carena remarks, that the lines and striae produced in glass during its manufacture, are generally ellipses, or waving figures, bearing no resemblance to the superb pictures which sometimes adorn our windows; and that the smoothest glass, on which no figures are visible, even with a magnifier, often produces the most beautiful frost foliage.

M. de Mairan has also another theory. He supposes that the motion of the hand in cleaning the windows may produce furrows in the glass, which may have something to do with the frost-work figures. In order to get at the value of this opinion, Carena, during the severe winter of 1814, selected four panes of his window which he cleaned with fine sand, as is common in France, rubbing two of them with a circular motion, rubbing the third in lines parallel with the upright sides of the window-frame, and rubbing the fourth in diagonal lines. On the next morning he found that the frost had very accurately followed the motion of his hand, filling up the little furrows produced by the friction, the space between them being occupied by small angular crystals. In the two panes which had been rubbed with a circular motion, the frost appeared like a prickly crown, the space in the centre being quite free from ice, although on a subsequent morning it was covered with a smooth layer, not foliated. On the outside of the circular space, that is, parallel with the wood-work, and on the part which had not been rubbed, were some beautiful boughs covered with foliage. The two other panes exhibited, in the directions in which they had been rubbed, long opaque filaments of frost, with small crystals proceeding from them at right angles, or nearly so, resembling a bundle of thorns; or brambles. These panes also exhibited a far more graceful display of foliage in the parts near the wood-work which had not been rubbed.

Thus it appears, that by friction certain figures are impressed on the glass which determine the forms of the frost; but the origin of the beautiful foliage, which appeared on those parts of the glass where no friction had been exerted, had still to be accounted for. It was entirely different from the frost produced on those parts of the glass which had been rubbed; and the foliage of one day seldom resembled that of another, even on the same pane. When the exterior cold was moderate, the frost was never figured, a temperature many degrees below freezing being required to produce the foliage.

When the temperature is only a half or a whole degree

below the freezing point (32° Fahr.) the frost does not entirely cover the panes: some are quite free from it, while others have it in large irregular patches. This leads to the curious conclusion that the heat does not escape equally from all parts of the same pane, but passes through some parts with more facility than others. This would produce a curling of the vapour as it was deposited on the pane.

That the unequal conducting power of different parts of the same pane has something to do with the form of the frosty figures is evident from the fact, that, if a body of equal and uniform conducting power be substituted for a pane of glass, the foliage disappears entirely. A sheet of copper was substituted for a pane of glass, in a room the temperature of which varied between 43° and 50° Fahr. When the temperature of the external air at six o'clock, A.M. was between 32½° and 36°, the glass panes were perfectly dry, but the metallic pane was covered with dew. Between 32° and 24° both glass and metal were bedewed; but the latter more readily and abundantly. Between 24° and 20° frost was formed on all the panes, but most abundantly on the copper. Between 20° and 5° the glass was covered with most graceful foliage, but the copper had a smooth uniform sheet of ice, without any approach to foliation, except near the wood-work of the window frame.

If a copper or a tin-foil disk be fastened to the central part of one of the panes on the inside, and a similar disk be attached to another pane on the outside, the disk on the inside will be more thickly covered with frost than any other part of the pane; but that portion of the other pane which corresponds to the disk on the outside, will be entirely free from frost. This remarkable difference admits of easy explanation. A large portion of the heat of the room escapes through the window until the glass is sufficiently cold, first to condense, and afterwards to freeze upon its surface, a portion of the vapour of the room. The metal disk on the outside, however, reflects back the heat, which would otherwise escape into the air, and thus preserves that part of the glass which it covers, at a higher temperature than other parts of the same pane; and, as glass is a very bad conductor of heat, the adjacent parts are not affected by this portion, which is kept too warm to condense the vapour of the room. With respect to the metal disk on the inside, the case is different; metal being a good reflector, but a bad absorber of heat, all the heat of the room which falls on the disk, is reflected back again, and never reaches the part of the glass below the disk; the glass therefore soon falls to the temperature of the outer air, and, in its turn, cools down the metal disk to a point much lower than the rest of the glass, and hence the greater deposit of moisture on the inner metallic disk.

Another beautiful experiment throws considerable light upon the forms assumed by frost on the window panes. If, when the cold is tolerably severe, we breathe lightly against a well-cleaned window pane, there will be formed, in a few minutes, a figure somewhat resembling a quill pen, the barbs being represented by threads of ice proceeding on both sides from a common shaft, or barrel, and having only a slight curvature. If, however, we breathe more forcibly, the curvature of the barbs becomes increased. It often happens that the barbs which, after a gentle expiration, are about to form in lines almost straight, become strongly curved by a second and more forcible expiration. In a gentle expiration, the vapour remains nearly stagnant on glass, and the curvature of the crystals, which is slight, is toward the centre of the mass of expired air; but in a stronger expiration the vapour, after having struck the glass, is gradually diffused over the surface in whirls, whereby the barbs are much more strongly curled.

It seems probable from this experiment, that, if any force, capable of communicating a certain movement to the vapours of the room, were to act at the moment when a low external temperature had condensed these vapours on

the glass, this force, combined with the natural force of crystallization, would sufficiently account for all the varieties of frost-work which adorn our windows.

It must be remembered that water in freezing or crystallizing under ordinary circumstances, is free to act in all directions, but, on a plane surface, such as a window-pane, it is constrained to act in one direction. The surface of glass offers numerous resistances; the radiating and conducting powers of the same pane are different in different parts; and, in addition to all these disturbing causes, there are many local circumstances arising from situation, the presence of blinds, window-curtains, and other conditions, which cannot be noticed in dealing with general results.

Thus the reader will see that a good deal of somewhat refined science is concerned in attempting to explain this beautiful phenomenon. Should this notice have the effect of exciting observation and inquiry during the present winter, the object of the writer will be attained.

A CHRISTMAS PARTY IN THE COUNTRY.

CHAP. VI.

VISITORS FROM THE VICARAGE.

THE snow was melting rapidly away in the park of Kirkfield; and the sun, which had shone so brilliantly on its glittering crystals, now looked here and there on patches of verdure which emerged from that covering, and had lain safely protected by it from the rude frost—as warm feelings are often hidden under a cold exterior, to escape the chilling sarcasms of the thoughtless and the worldly. There was something solemn in the gradual fading of the wintry pageant; the air was still and calm, and the silence unbroken save by the heavy fall of some mass of snow which came down at intervals from the loaded trees, or by the creaking of the branches as, relieved from their burthen, they gradually began to resume a less bending position. Now and then a solitary crow might be seen skimming its way through the air, and its clear loud call seemed a note of rejoicing in the recovered liberty of nature. Justine L'Estrange appeared impressed by the quietude of the scene, and, after gazing on it for some time, remarked upon its beauty; adding, "I think I felt it even more yesterday than I do to-day. There was certainly more animation in seeing all the people proceeding to church: yet there was a staidness in their demeanour which spoke a reverential consciousness of their common object, and made them rather add to, than take from, the general impression of solemnity."

"I am pleased to hear your remark, my dear Justine," said Mrs. Martha Loraine; "I have myself often felt the soothing influence of the scene as fit preparation for the solemn services of the Church, and always endeavour to be ready a little before the rest of the party, in order that I may enjoy it. It is beautiful to see the labourers and their wives and children coming across the fields, which no longer yield their sustenance, to pray for continued blessings from that God who has promised that 'seed-time and harvest shall never fail;' and who will soon change the sterile face of winter to the rich luxuriance of summer; and, oh, it is beautiful, on the summer sabbaths, to watch them pouring down from the hills, group after group, winding along the terrace, or crossing the park from the more distant homesteads! To me the interest is, indeed, great. There are some faces which I have known for years, and I still remark them regularly returning with their homage to

the God who has protected them, and clothed them, and fed them, through their long pilgrimage. There are the same features which I knew in earlier life, but each year takes from their freshness,—the same forms, but every winter brings a gradual stoop, and an increasing feebleness. Even the best grey homespun coat, and the once bright red cloak, I recognise again, and they often look less worn than their wearers."

"There are some few striking figures amongst the villagers," remarked Justine, "particularly one old woman with a face puckered into innumerable wrinkles, and a low figure, bent still lower by age, who always walks with her dark linen gown tucked up to display a well-preserved quilted green petticoat, made of some almost forgotten material."

"Poor old Deborah Dison, with her green culimanco petticoat, is indeed a striking figure, and always looks to me like some fantastic, gnarled, and knotted stump of an oak tree," said her aunt; "for she has resisted many storms of adversity, and, like the oak, only seemed the more firmly rooted to the earth by the winds which blew over her. I have sometimes heard it asked of a blighted tree, why is it left when beauty and usefulness are gone? and the answer has been difficult to find. Perhaps, when looking at poor Deborah, some may be tempted to exclaim, 'Cut it down, why cumbereth it the ground?' for she has long seemed useless—all who depended upon her for support, or to whom she might have looked for it in her latter days, are gone—she is alone, and, to a superficial observer, a cumberer of the ground; yet, the Great Husbandman has an answer to the inquiry. With that hard exterior a change is going on inwardly. She was always a hard-working woman, rising early, and late taking rest: and maintained a decent and steady character; but formerly the sabbath shone no sabbath-day to her; she was full of worldly cares, and the things of time hid from her eyes the greater things of Eternity. To all that our good vicar would urge on the necessity of attending to the 'one thing needful,' she opposed the immediate necessities of her worldly duties, and years glided by without any impression being made. Deborah was at length a leafless and a withered stump; but gradually the change has been wrought, and she now comes to the House of God, to find there comfort, mingled with repentance for opportunities neglected, and regret that she has wasted years of toil uncheered by that light which is now lighting her peacefully to the grave."

"If Deborah Dison be like a gnarled oak, my dear aunt," said Lucy Loraine, "I think you may compare poor old Mrs. Mills to a graceful willow; she is so fragile, so drooping; and yet there is a freshness about her which seems to adorn her as the willow leaves adorn an almost time-destroyed trunk. Her fair and delicate features, with their placid expression, her silvery grey hair, and her slight tall figure, are almost lady-like, and look as if it were impossible that any impurity should adhere to them; and her clothes, though of the plainest and coarsest materials, seem to have the same quality, and are always strictly tasteful, and clean, and neat. Her white knitted lambs'-wool stocking and well-polished shoe appear never intended to be soiled by walking, and I suspect she has that opinion herself, for winter or summer Mrs. Mills is never seen without her pattens."

"I do not remember to have seen her walking without them," said Aunt Martha; "and lightly she used to trip in them at the head of her well-ordered scholars, whilst she was still able to perform the function of village schoolmistress. Now that age and infirmity have obliged her to relinquish that post, I am pleased to see the love and reverence with which the young ones still cling to her, and how glad they are to lend her their support to church each Sunday, looking up in her face, and blushing and smiling at her thanks and praise; and I am still more pleased, on leaving church, to see that the young men have not forgotten the lessons of

their childhood, and that there is always one or other ready to lend her his arm up the steep bank, and give practical proof that her teaching has not been thrown away. Mary Mills has been a blessing to the village, and she has taught by example as well as by precept."

"She certainly looks very superior to her situation," said Justine; "I could fancy she had a history attached to her, and was no common person."

"She is not, indeed, a common person. She was the daughter of a worthy simple-minded curate in one of our most sequestered dales, and, with an only sister, was early left an orphan, with a very small pittance. Mary married the schoolmaster of Kirkfield, and was for a few years a happy wife; but her husband, too, died young, and left her to struggle with poverty and four infant children, for whom she toiled patiently and even cheerfully, assisted as far as she could be by her sickly sister, whose little income was added to the common stock. Two of her children—the girls—repaid her care, and grew up all a mother's heart could wish, but scarcely had they reached their girlhood, when they successively drooped and died. The eldest boy, unchecked by a father's firm hand, broke from all restraint, and ran off to sea; and the youngest, the most cherished, was an idiot."

"Poor woman!—she had indeed sad trials!"

"Even the sad trial of watching her favourite boy grow up unconscious of his duties and his privileges she bore cheerfully. 'It was the will of God,' she said; and she looked forward to the day when Jimmy's soul would be freed from all bodily impediments, and open to the bright consciousness of everlasting happiness. She prayed and hoped that he might grow up harmless, and always soothed his wayward humours, and, as far as was possible, encouraged his childish pleasures. Not so her sister: she, too, was fond of the boy, but sickness had made her irritable, and, as years drew on, though her health improved, this irritability increased, and many and sad were the contentions between them, the uncouth idiot boy and the frail sickly woman venting their rage at each other in most horrible contentions, and the poor mother often exposed to the blows of both whilst endeavouring to part them. At length decided insanity appeared in the sister, and it became necessary to place her in confinement, where the whole of her little income was required for her support; and poor Mrs. Mills had to struggle on alone, for Jimmy soon escaped from her watchful care, and became a homeless wanderer, often disappearing for weeks together, and then returning ragged and wretched, to escape again as soon as his mother had expended her little savings in clothing him."

"Is he living yet?"

"No; a few winters ago, after an absence of longer duration than usual, his body was found in the river not far from this place, in a state of decomposition, which proved that it had been long there. No clue was found to his death, and the general belief is that it occurred by accident."

"How did she bear his loss?"

"Most calmly," replied Lucy. "I went with my mother to see her as soon as we heard what had happened, and found her quietly preparing some little mourning; and, in reply to our condolence, she said—'Though the first shock was great, the first reflection brought thankfulness to her mind, and proved to her that in this, as in every other event of her life, God had done well for her. Her strongest tie to earth was now broken; and it had long been her chief regret in thinking of death, that, when she was gone, there would be no one to care for poor Jimmy. God had now provided better things for him than she could have done, and she had only to prepare to follow him.' All this was said with a quietness which carried conviction of the depth of her feelings, and in a few days she was again at the head of her little scholars. From that time, however, her strength rapidly declined, and on the death of her

sister, whose little property she inherited, she gave up her school."

"How does she employ herself?"

"Oh! she has plenty of occupation in her household arrangements, which are never seen but in the nicest order; and she reads a great deal. Her library to be sure is not very extensive—a Bible, a Prayer-book, Nelson's Fasts and Festivals, and an odd volume of the Spectator, composing her whole stock; but, when we offer to lend her more, she always declines them, and says she has all she wishes for, and all that are necessary to comfort and console her. "If I want to hear of God's love," she remarked one day, "I can read it in His word; if I wish to make my wants known to Him, the prayers which my dear father offered up for so many years are before me, and let my wants or my feelings be what they may, in the Prayer-book I can always find expressions better fitted to present them to His throne than any other I ever met with. I have here the words of sobriety and truth."

"She seldom stirs out except to church," added Mrs. Martha Loraine, "and there she is never missed, winter or summer. Fair or raining she is seen amongst the first who answer the call of the bell, and in the summer evenings I often see her lingering near the spot which she says will soon be her last home, but one. One other removal she looks for, and that is from earth to heaven. I think there are none of the many figures I love to watch on the Sunday mornings, more interesting than Mrs. Mills."

"None, aunt?" asked Rosaline Loraine, who had silently joined the party at the window; "surely the vicar is more interesting, as he walks quietly on his way, looking kindly first on one, and then on another of his flock, listening to all they have to say to him, inquiring after the sick, advising the distressed, and encouraging the well-doing. I never see him thus without thinking that his is the most desirable station of life, which thus humbly, imitates the Good Shepherd, and when the rustic group at the church porch stand to let him pass, raising their hats in love and reverence, and then following him into the church, he always seems a type of Him who has said 'His sheep hear His voice, and follow him.'"

"We lose something of the beauty of that expression from our customs differing from those of the east," remarked Lucy. "Here the shepherd drives the sheep before him."

"Then I have the advantage of you," said Justine, "since in many parts of France I have seen the shepherd leading the way, and the sheep following him, and can therefore fully realize the picture."

"Do you remember Mrs. Hemans's beautiful sonnet?" asked Rosaline:—

How many blessed groups this hour are bending,
Through England's primrose meadow path their way
Towards spire and tower, 'midst shadowy elms ascending,
Whence the sweet chimes proclaim the hallowed day!

"It always appears to me most applicable to our own Sunday scenes. But" she added, "I hope Mr. Forster will be well enough to come to us this evening as he promised. The day has been so mild he will have little fear of cold, and I am sure Charlotte will wrap him up well, for she always huddles as many great coats and shawls upon him as he can well carry, and he often laughs at his own load, yet does not like to refuse what is pressed upon him by love."

"Agnes has been talking of the party the whole morning," said Justine, "and she and Laura have both run into the garden to search for a bouquet to deck the mantelpiece. I wonder what they will find."

"Here they come," cried Lucy, "with their hands full of fresh holly, and I believe have discovered a bunch of Christmas roses."

Glowing with exercise, and delighted with the success of their search, Agnes and Laura entered the

saloon and displayed their treasures, which they endeavoured to dispose of to the best advantage. A short time saw the day closing in, and its requiem was sung by the cheerful robin, who gave a blithe welcome to the guests from the vicarage. An arm chair close by the fire was offered to Mr. Forster, but he declared that he did not feel the cold, and added, that the song of the robin, as he descended from the terrace, had almost cheated him into the belief that winter was departing with the departing snow. "I am almost tempted to give you something like a sermon," said he, "so strongly has that little warbler brought to my mind a passage from Bishop Hall."

Mrs. Loraine and Mrs. Barlow begged he would do so, and, after a little coaxing of his excellent memory, repeated the passage.

"The little innocent inhabitants of the air, which are continually flying around us, were not created only for the use of the body of man. They serve higher and nobler ends. They often read lectures, to which the greatest philosopher might attend, and be the better for them, if he would consider and apply them aright. When, therefore, you behold one of these choristers of heaven, singing upon a naked bush, amidst the darkness and desolation of winter, might you not address it in some such manner as the following? Sweet bird, how cheerfully dost thou sit and sing; and yet knowest not where thou art, nor where thou shalt make thy next meal, and at night must alroud thyself in this same bush for a lodging, while the winds shall howl through it, and thy feathers shall be wet with rain, or covered with the snow! How ought I to blush, who see before me such liberal provisions of my God, and find myself sitting warm under my own roof, yet am ready to droop through a distrustful and unthankful dulness! Had I so little certainty of my support and shelter, how anxious and heartless should I be! how little disposed to make music for thee or myself! Surely thou camest not hither without a providence; God sent thee not so much to delight, as to shame me out of my sullen unbelief, who, under far more apparent means of maintenance and protection, am less cheerful and confident. Reason and faith, alas! have not yet done for me, what mere instinct does for thee; and want of foresight makes thee more merry, if not more happy, than the foresight of better things maketh me. Certainly, thy providence, O God, is not impaired by those superior powers thou hast given me; let not my greater helps hinder me from possessing an holy security and comfortable reliance on thee. I never knew an earthly father take care of his fowls and neglect his children: and shall I suspect this of my heavenly Father? That man is unworthy to have God for his Father in heaven, who depends less upon His goodness, wisdom, and power, than upon a crop of corn, which may be spoiled either in the field, or the barn."

"Beautiful! Beautiful!" exclaimed the whole party.

"There is no lesson to be learned from the study of nature, more desirable than that of cheerfulness and contentment, nor is there any season in which nature's sources of enjoyment are not opened to us by the bountiful hand of providence," said Mrs. Loraine.

"Agnes and Laura have been discovering beauty in the wintry waste this morning," said Sophia, "and I hope their success has not been lost upon you, Margaret."

"Indeed it has not, for I have been admiring the beautiful contrast of the dark glossy leaves and bright scarlet berries of the holly with the delicate white of the Christmas-rose, ever since I entered the room. There is great taste shown in their arrangement."

"Are you a botanist or a florist, Miss Campbell?" asked Cyril, "if you be, Sophia is prepared to give you a long history of the flower. We have lectures every evening for the benefit of Justine and Frederic."

"I imbibed a good deal of your sisters' taste when last at Kirkfield," replied Margaret, "and have all a woman's love for flowers; though my poor country can boast of little beauty in that way, except her heather, and that a Scottish heart would not exchange for all the gorgeous blossoms of the tropics."

"Do not say so; you do not know how brilliant and how lovely the flowers are which bloom on our eastern shores. They glow like the gems which are treasured

in the eastern mines, and far surpass such a chilling flower as this of which Agnes boasts so much."

"This however, is not a native of England," said Sophia.

"So much the worse," cried Charles "if you were obliged to send unto a far country for such a thing; pray where does it come from?"

"It is a native of Austria, and was introduced into our gardens about the year 1596. You are very ungrateful to despise a flower which comes at this bleak season, to assure us that all vegetation is not extinct. I always look upon it as the one comforting hope left at the bottom of Pandora's box."

"Well, the poor flower gets admired as a plain girl may be regarded in the absence of beauty," laughed Charles.

"I doubt not but to eyes like Sophia's it has something 'than beauty dearer.' I think Charles wrong, in despising these flowers," said Justine; "some of them are really very pretty in their pure white dress; but I must own others look a little soiled and less pleasing."

"The flowers are frequently of this beautiful snowy whiteness when they first expand," replied Sophia, "but even then, on some of them may be seen a streak of this dull pale purple, which increases each day, and becomes mingled with green, until the discoloured petals drop off, and leave the seed vessels enlarged and in shape like those of a buttercup, to which tribe—the ranunculus—the plant belongs. Its botanical name is *Helleborus niger*; *Helleborus* from two Greek words signifying 'food which causes death,' alluding to the very poisonous qualities of all the species."

"Why do you call it *niger*?" asked Alleyn, "when it is white and not black? Do you mean to persuade us black is white?"

"It is called *niger*, or black, from the colour of the long fibres of the roots; for botanists, though accused of mere dry system, are certainly not very systematic in their mode of bestowing names. An English Hellebore—the *Helleborus viridis*—takes its name from the green colour of its flowers. The Green Hellebore grows very plentifully in the woods in this neighbourhood, and contributes much to their beauty in the early spring, therefore it has a place in the 'Flora Kirkfieldensis,' which is not allowed to the Christmas-rose. Here is the drawing, by which you will perceive the flower is smaller, and still more resembles its relation, the Buttercup, though it has not the gay golden tint of Frederic's favourite."

"You were to guess some of James Hamilton's charades to-night, Margaret," interrupted Agnes. "Can you find out this, which he gave us last year?"

'Welcome my *First* with a joyous sound,
Pile on the faggot, sling torches around!
Pledge the bright wassail-cup! Health to the gay!
Yet turn not the needy and wretched away.

Where is my *Second*, so lovely and fair,
'Mid Summer's sweet beauties most beautiful there?
Where has she shrunk from stern Winter's cold breath?
Where lies she neglected, yet fragrant in death?

Behold, at the grave of my *Second*, appears
My *Whole*, a pale mourner bedewed with her tears;
Yet graceful and welcome, 'neath dark-clouded skies,
To remind us that Spring-flowers again will arise."

THE STREETS OF LONDON.¹

(Concluded.)

THE earliest work on "Streets," that we can at present recollect, (for we do not lay claim to much of antiquarian lore,) is by Guillot de Paris, towards the close of the 13th century, "On the Streets of

Paris." This is a vulgar poem of about 500 lines, and is now in the King's Library at Paris. Its sole value arises from the information it gives relating to the locality of the streets of that great city "i' the olden time," the articles sold in them, and their inhabitants, of whom unfortunately he only mentions the least respectable. A much more valuable account is to be found in the former part of vol. 1 of Sauval's Hist. and Antiq. of Paris, 3 vols. fol. 1724. Something of this sort relating to our own metropolis may be picked up from Lydgate. But as we proceed lower, our information increases, and "honest John Stowe," with his editors, Strype, and Thoms, (1842) Maitland, Entick, Pennant, Northouk, Moser, Malcolm, Norton, Hughson, Hone, Knight particularly, and Brayley, supply us abundantly; and of their stores the authors of these volumes have judiciously availed themselves, in addition to their own resources.

This volume, which travels over well trodden ground, (from Temple Bar to the Tower,) will not admit much novelty of extract. We shall, however, proceed with our remarks.

"The other city gates were pulled down and the materials sold in 1672."—Vol. ii. p. 2. We think here must be some mistake. We have made an extract that on Wednesday, 30th July, 1760,—

"The materials of the three following city gates were sold before the Committee of City Lands to Mr. Blagden, a carpenter in Coleman Street, viz.—*Altgate* for 177l. 10s.; *Cripplegate* for 91l.; and *Ludgate* for 148l. The purchaser was to begin to pull down *Ludgate* on August 4, and the two others on September 1, and is to clear away all the rubbish, &c., in two months from those days."

In p. 5 sad confusion is introduced by twice mentioning the name of Messrs. Hoare and Co., instead of Messrs. Childs. No one ever supposed that the banking-house of the former stood on "the site of the famous Devil tavern," while those who know anything are aware that the buildings in Child's Place occupy that site. There is a considerable distance between the two houses.

P. 58. "In Fetter Lane resided that celebrated leather-seller of the times of the Revolution (!) known by the name of Praise-God Barchbones"—read *Rebellion*.

"In the year 1561, the old church [of St. Paul's] was nearly burnt to the ground. . . . The cathedral was restored without the spire."—*Ibid.* pp. 234, 235.

We avail ourselves of this opportunity to correct a ludicrous mistake in a note on Rowley's "Search for money," published by "The Percy Society," 1840. The text is—

"Now wee were entred the Temple: to finde him there we had not such an unhallowed thought, for there the pillars were hung with poore men's petitions, some walking there, that if they prayed as well as fasted, did very well and sincerely; nay, the very Temple it selfe (in bare humillity) stood without his cap, and so had stood many years; many good folkes had spoke for him because he could not speake for himselfe, and somewhat had been gathered in his behalfe, but not halfe enough to supply his necessity."—*Ibid.* p. 27.

To which is appended this portentous note—

"The pillars of the Temple 'hung with poore men's petitions,' is a curious feature of the time. What Rowley says about the Temple 'standing without his cap, and so had stood many years,' and about an insuf-

(1) An Antiquarian Ramble in the Streets of London, with anecdotes of their more celebrated Residents. By J. T. Smith, &c. Edited by Charles Mackay, LL. D. 2 vols. 1846.

cient collection for the repair of the buildings, is not very intelligible in our day" !—*Ibid.* p. 47.

No reference is here made to the *Temple*, one of the Inns of Court, but to THE Temple, the Cathedral Church of St. Paul. The "poore men's petitions" are the "*si quis*" and other advertisements there hung up. The "*cap*" was the *strephe*, without which it had been more than forty years. Concerning the dilapidated state of St. Paul's in the beginning of James the First's reign, see Malcolm's *Londonium Redivivum*, vol. iii.

We think Dr. Mackay would have evinced his judgment, as well as his information, by placing Bishop Van Mildert "among the eminent rectors" of Bow Church.

It is surprising how a tradition, especially if congenial to the sentiments of the transmitter or the recipient, is still continued, in spite of contradiction or confutation. We are told "No one reads answers." Yet Dr. Mackay ought not to yield to "popular delusions." We, however, have here "the twice sodden kail" that has been long rejected from every "well appointed table." We are told, Vol. ii. p. 324—

"Beckford's monument is considered a fine likeness of that celebrated magistrate. It represents him standing in the attitude in which he addressed the King when he presented his memorable remonstrance in 1770. Underneath, as the most fitting inscription to his memory, are the words of the remonstrance" ! !

The late William Gifford was a man of as much accuracy in his assertions as power in sarcasm. We do not adopt his expressions, though we quote them :—"Their hall is even yet disgraced with the statue of a worthless negro-monger, in the act of insulting their sovereign with a speech, of which (factions and brutal as he was) he never uttered one syllable."—Ben Jonson, vi. 481. Gifford, no doubt, like many others, derived his information from the following authentic source :—"It is a curious fact, but a true one, that Beckford did not utter one syllable of this speech. It was penned by Horne Tooke, and by his art put on the records of the City and on Beckford's statue, as he told me, Mr. Braithwaite, Mr. Sayers, &c., at the Athenian Club.—ISAAC REED."

Mr. Smith might have rendered his last Ramble more complete had he fallen into his old track by returning from the Tower through the Minories, Aldgate, and Fenchurch-street. These would have furnished some interesting reminiscences. Goodman's Fields was the cradle of Garrick's fame. In Fenchurch-street the patriot Wallace was lodged before he was carried to his trial at Westminster; and at the King's Head is still preserved, according to a tradition that carries its own refutation along with it, the identical dish from which Queen Elizabeth ate pork and pease pudding, after attending divine service at Allhallows Staining, the first church in her way from the Tower !

We again repeat that, in spite of numerous inaccuracies, (of which we have noticed only a few,) these are very entertaining volumes. But we are sorry to see such gross typographical errors as the following :—p. 15. Masquéner for Masquérier; 49. Lander for Lauder—Hentzen for Hentzner; 246. Philadelphia for Philadelphieion; 287. Catahori for Catalaori; 303. Ticket for Ficket, &c. These occur in Vol. I.—we let alone the II.

BRETON TRADITION.

THE THREE ADVENTURERS.¹

A Legend of the Country of Treguier.

IN those days when the Lower Britany was oftener honoured by the bodily presence of our blessed Saviour and His Virgin mother, when hermitages were as common along the wayside as branches of mistletoe² and watering-troughs now, there dwelt in the diocese of Léon, two young noblemen, rich as heart could desire, and so beautiful, that even their mother knew of no blemish in them. They were called Tonyk and Mylio.

Mylio, the elder, was almost sixteen, and Tonyk just fourteen years of age. They were both under the instruction of the ablest masters, by whose lessons they had so well profited, that, but for their age, they might well have received Holy Orders, had such been their vocation.

But in character the brothers were far unlike.

Tonyk was pious, charitable to the poor, and forgiving to those who injured him. Neither would money tarry in his hand, nor resentment in his heart. While Mylio gave but his due to each; would drive a hard bargain, too, and never failed to revenge an offence to the utmost.

Having lost their father whilst yet infants, they had been brought up by their widowed mother, a woman of singular virtue; but, now that they were growing towards manhood, she thought it time to send them to the care of an uncle, who lived at some distance, and from whom they might receive good counsels for their walk in life, besides the expectation of an ample heritance.

So, one day, after bestowing upon each a new cap, a pair of silver-buckled shoes, a violet mantle, a well-filled purse, and a horse, she bade them set out for the home of their father's brother. The two boys began their journey in the highest spirits. They were going to see new countries. Their horses travelled so fast, that in a few days they found themselves in another kingdom; where the trees, and even the corn, were quite different to their own.

One morning, as they came to a spot where several ways met, they saw a poor woman seated beneath a crucifix, her face buried in her apron. Tonyk drew up his horse to ask her what was the matter. The beggar answered, sobbing, that she had just lost her only son, her all whereon she had to depend, and that she was now cast upon the charity of such whose hearts God might move towards her.

The youth was touched with compassion; but Mylio, who waited at a little distance, called to him, mockingly,

"You are not going to believe the first pitiful story you hear by the way-side! It is just this woman's trade to sit here, and beguile travellers of their money!"

"Hush, hush! my brother," answered Tonyk, "in the name of God! You only make her weep the more. Do not you see that she is just of the age and the figure of our own dear mother, whom God preserve!"

Then, stooping down, he gave his purse to the beggar-woman, saying,—

"Here, my good dame, I can help you but little, but I will pray that God may be your consolation."

She took the purse, and kissing it, said to Tonyk—

"Since my young lord has been so bountiful to a poor woman, let him not refuse to accept from her this walnut. It encloses a wasp, whose sting is of diamond."

Tonyk took the walnut with thanks, and proceeded on his way with Mylio.

They soon reached the purlieus of a forest, where, after a while, they came upon a little half-naked child,

(1) We need scarcely explain that there are some expressions in this story which are only retained, because to have altered them would have impaired its value as a genuine specimen of a Breton Legend.—Ed.

(2) In Britany, the ensign of a public-house.

who was seeking somewhat in the hollows of the trees, and singing a strange air, more melancholy than a funeral chant. He often stopped to clasp his little frozen hands, saying in his song—"I am cold! Oh, so cold!" and the boys could hear his teeth chatter in his head.

Tonyk's eyes filled with tears at this sight, and he said to his brother,--

"Oh, Mylio! only see how this poor child suffers from the piercing wind!"

"Then he must be very chilly," replied Mylio. "I do not find the wind so piercing."

"That may well be, when you have on a plush doublet, a warm cloth coat, and over all, your violet mantle, while he is wrapped round by little but the air of heaven."

"Well, and what then?" observed Mylio; "after all, he is but a peasant boy."

"Alas!" replied Tonyk. "when I think that you might have been born to the same lot, my brother, it goes to my very heart;—and I cannot bear to see him suffer so."

So saying, he reined in his horse, and calling the little boy to him, inquired what he was doing there.

"I am trying," said the child, "if I can find any dragon-flies asleep in the hollows of the trees."

"And what can you do with the dragon-flies?" asked Mylio.

"As soon as I can find enough I shall sell them in the town, and buy myself a garment as warm as sunshine."

"How many have you got already?" asked the young lord.

"Only one," answered the child, holding up a little rushen cage, enclosing the blue fly.

"Well, well, I will take it," said Tonyk, throwing to the boy his violet mantle. "Wrap yourself up in that nice cloak, my poor little fellow, and add nightly to your prayers an Ave for Mylio, and another for our dear mother."

The two brothers continued their journey, and Tonyk, having now no mantle, was at first sorely tried by the cutting north wind; but, the forest once at an end, the air grew milder, the fog dispersed, and a vein of sunshine kindled in the clouds. And presently they came to a meadow, wherein was a fountain, and on its brink a poor old man sitting, in tattered garments; at his back a beggar's wallet.

As soon as he perceived the travellers, he addressed them in suppliant tones. Tonyk approached him.

"What would you, father?" he inquired, lifting his hand to his hat, in respect for the beggar's age.

"Alas! my dear young gentlemen," the old man replied, "you see how white my hair is, and my cheeks how wrinkled. By reason of my age, I am become very weak, and my feet can no longer bear my weight. I must certainly die in this place, unless one of you will consent to sell me his horse."

"Sell thee one of our horses, beggar!" cried Mylio, with an air of contempt; "and how wilt thou pay for it?"

"You see this hollow acorn," replied the beggar, "it contains a spider, the web of which is stronger than steel. Let me have one of your beasts, and I will give you in return the acorn with the spider!"

The elder of the two boys burst into a loud laugh.

"Do you only hear that, Tonyk?" cried he, turning to his brother. "By my Baptism, there must be two calf's feet in that fellow's shoes!"

But the younger answered gently:—

"The poor can only offer what he has." Then dismounting and going up to the old man he added,—"I give you my horse, honest friend, not for that which you offer for it, but in remembrance of Christ, who has declared the poor to be his chosen portion. Take him for your own, and thank God, in whose name I bestow him."

(1) A proverbial expression in Brittany to designate folly and impertinence.

The old man murmured a thousand benedictions, and mounting with Tonyk's aid, went on his way, and was soon lost in the distance.

But, at this last almsdeed, Mylio could no longer contain himself, and broke out into a storm of reproaches.

"Fool!" cried he angrily, to Tonyk, "are you not ashamed of the state to which by your folly you have reduced yourself? You thought, no doubt, that when all was gone, you might come in for a share of my money, my horse, and my cloak! But look for nothing of the kind. I hope this lesson may do you good, and that when you feel the inconvenience of prodigality, you may resolve to be more prudent in future."

"It is, indeed, a good lesson, my brother," replied Tonyk, mildly, "and I refuse not to receive it. I had never thought of sharing either your horse, your money or your mantle. Go on your way, therefore, without taking any care for me, and may God protect you!"

Mylio made no reply, but trotted on, his young brother following on foot, and gazing after him, so long as he remained in sight, without any feelings of reproach arising in his heart.

And thus they went on to the entrance of a narrow defile, between two lofty mountains, whose tops were hidden in the clouds. It was called "The Cursed Strait," for a dreadful Ogre dwelt among the heights, and there laid wait for travellers, as a hunter watches for his game.

He was a giant, blind, and without feet, but having so fine an ear for sound, that he could hear the worm working his dark way within the earth. His servants were two eagles, which he had tamed, (for he was a great magician,) and he sent them out to catch his prey, when he heard it coming. Whenever the country-people had to traverse the dreaded pass, they carried their shoes in their hands, like the girls of Roscoff when they go to market at Morlaix,² and held their breath, lest the Ogre should hear them. But Mylio, who knew nothing of this, went on at full trot, and the giant was awakened by the sound of horse's feet upon the stony way.

"Ho! my harriers!" cried he, "where are you?"

The white and the red eagle hastened to him.

"Go and fetch me, for my supper, whatever it is that now passes by," said the Ogre.

Like balls from the mouth of a cannon, they shot down the ravine, and seizing Mylio by his violet mantle, carried him to the Ogre.

At this moment Tonyk came up to the entrance of the defile. He saw his brother borne away by the two birds, and rushed towards him with a loud cry; but the eagles and Mylio almost instantly vanished in the clouds that hung over the highest of the two mountains.

For a few seconds the boy stood rooted to the spot with horror, gazing upon the sky and the rocks that were above him like a wall; then, sinking on his knees, with folded hands he cried,—

"O God, the Almighty maker of the world, save my brother Mylio!"

"Trouble not God the Father about so small a thing as that," exclaimed three little voices, that suddenly, and for the first time, he heard close by him.

Tonyk was in amazement.

"Who speaks? Where are you?" asked he.

"In the pocket of thy doublet," answered the three voices.

The lad searched his pocket, and drew out the walnut, the acorn, and the little cage of rushes, which contained his three insects.

"Will you, then, save Mylio?" said he.

"We will, we will, we will," they replied, in their various tones.

"And how can you save him, poor little nothings that you are?" continued Tonyk.

"Open our prisons, and thou shalt see."

(2) Readers who have travelled in Scotland will recognise the trait.

The boy did as they desired; and immediately the spider crept to a tree, against which she began a web, as strong and as shining as steel. Then mounting on the dragon-fly, which raised her gradually in the air, she still wove on her net-work, the several threads of which were so arranged that the whole looked like a ladder gradually unwinding itself from a roller. This wonderful path Tonyk followed until he reached the summit of the mountain. Then the wasp mounted in the air before him, and he came with her to the giant's house.

It was a grotto, hollowed in the cliff, and lofty as a cathedral nave. The blind and footless Ogre sat in the midst of it. He seemed in high glee, for he was rocking himself to and fro, like a poplar swaying with the wind, and singing the following words:—

"Oh! a Leonard is a dainty rare!
On bacon fed, and such fat fare!
The Treguier folks taste sweetly too,
Of pancakes fried, and milk that's new;
But banished Vannes and Quimper be,
They eat too much black corn for me!"

And while he sung, he made ready the slices of bacon for roasting Mylio, who lay on the ground, his legs and arms tucked behind him, like a fowl trussed for the spit. The two eagles were at a little distance, by the fireplace, one acting as turnspit, while the other made up the fire.

The noise which the giant made in singing, and the attention he paid to his rashers, prevented him from hearing the approach of Tonyk, and his three little servants; but the red eagle perceived him, and darting forwards would have seized him in its claws, had not the wasp, at that very moment, pierced its eyes with her diamond sting.

The white eagle hurrying to its fellow's aid shared the same fate. Then the wasp flew upon the Ogre, who was now turning about on hearing the cries uttered by his servants, and began to sting him without mercy or intermission. The giant roared like a bull in August. In vain he whirled his huge arms like the sails of a windmill; having no eyes he could not catch the creature, and, for want of feet, it was equally impossible for him to escape from it. At length, he threw himself with his face upon the earth, to shield himself from its fiery dart, but the spider creeping up, spun over him a net that held him hopelessly fast.

In vain he called upon the eagles for help. Savage with pain, and no longer fearing him, now they found him conquered, their only impulse was to revenge upon him their long and cruel slavery. Fiercely flapping their wings, they flew upon their former master, and tore him in their fury as he lay beneath the web of steel. With each stroke of their beaks they carried off a strip of flesh, nor did they abate their rage till they had laid bare his bones. Then they cowered down upon the mangled carcass; and, as the flesh of a magician, to say nothing of an Ogre, is a meat impossible of digestion, they never rose again.

Meanwhile Tonyk had unbound his brother, and, after embracing him with tears of joy, led him out of the Ogre's cave to the edge of the precipice. The dragon-fly and the wasp soon made their appearance harnessed to the little rushen cage, now transformed into a coach. They invited the two brothers to take their places within it, while the spider sat herself behind like a magnificent lacquey, and the equipage started with the speed of wind.

In this way Tonyk and Mylio travelled without fatigue, over meadows, woods, mountains and villages, (for in the air the roads are always well kept,) until they arrived before their uncle's castle.

There the carriage came to ground, and rolled onwards to the draw-bridge, where the brothers found both their horses in waiting for them. At the saddle-bow of Tonyk hung his purse and his mantle; but the purse had grown much larger and heavier, and the mantle was now all powdered with diamonds.

Astonished, the youth turned towards the coach, to ask what this might mean; but behold, the coach had disappeared, and instead of the wasp, the dragon-fly and the spider, there stood three angels all-glorious with light!

Awe-struck and adoring, the brothers sank upon their knees.

Then the most beautiful and most dazzling of the angels drew near to Tonyk, and said:—

"Fear not, thou righteous one! for the woman, the child, and the old man, whom thou hast succoured, were none other than our blessed Lady, Jesus Christ, her Son, and the Holy Saint Joseph. They sent us to guard thee on thy way from harin, and now that our mission is accomplished, we return to Paradise. Only remember all that has befallen thee, for it is an example."

At these words the angels spread their wings, and soared away, like three white doves; chanting the Hosannah! as it is sung in the churches.

SCRAPS FROM SERJEANT TALFOURD'S VACATION RAMBLES.

(Concluded.)

FR. T. HEAD'S CENSURE OF ENGLISH SCHOOLS.—(Concluded.)

"IN assailing the universities, our author makes as large an admission of the excellence which they 'do not prevent,' as he accords to our schools. 'I firmly believe,' he says, 'that the twelve hundred students, who at one time are generally at Oxford, are as high-minded, as highly talented, as anxious to improve themselves, as handsome, and, in every sense of the word, as fine a set of lads, as can anywhere be met with in a body on the face of the globe.' Again I ask, 'What would you have more? May not you obtain less? What, is the complaint against the university so potent, that it prevents the application of the Scriptural rule, 'By their fruits ye shall know them?' Arriving at Oxford they find a splendid High-street, magnificently illuminated with gas, filled with handsome shops, traversed by the mail, macadamized, and like every other part of our great commercial country, beaming with modern intelligence. In this street, however, they are not permitted to reside; but, conducted to the right and the left, they meander among mouldering monastic looking buildings, until they reach the cloisters of the particular college to which they are sentenced to belong. By an ill-judged misnomer they are from this moment encouraged, even by their preceptors, to call each other men; and a man of seventeen, too tall for school, talking of another man of eighteen, is generally, as I always mention the name of my prototype, Methusalem.' Now, without pausing to inquire whether the substitution of all sorts of miscellaneous information for the discipline of classical instruction will tend to prevent the assumption of mannish airs in adolescence; or to examine the results of that Prussian compulsive education, which our author desiderates, in converting docile boys into conceited little men, long before the commencement of English university life, I may venture to express my astonishment at the description given of the High-street of Oxford, and the lamentation that the collegians, not permitted to reside amidst its 'handsome shops,' are sentenced to take up their abode in some monastic looking college. The description of the 'stream-like wanderings of that glorious street,' is applicable, if at all, only to part of it; and what would that part be but for the 'monastic looking buildings' that glorify its continuation, and redeem its commercial beginning from the insignificance of a street of respectable shops in a country town? And does a true English writer really think that it would be better for a young man to live in such a street as he fancies this, at best a very inferior Chesapeake, than in the sequestered beauty of one of those buildings, which

time has been charmed to spare; in which the loveliness of nature has striven with the graces of art and the influence of years to endow fit birth-places for immortal thoughts? Does he think that there is nothing in the hopes that are there excited; in the friendships that are there born, in the principles that are there instilled, in the veneration for greatness, and the love for goodness which are there induced, tending to that result which he admits; and that when he enumerates the mere subjects of formal examination, he truly catalogues the blessings which the university confers? Can he even look at the colleges of Oxford, trace their histories, learn that they have gradually arisen, hall by hall, from small and humble lodgings for poor scholars, and have been increased, and adorned, and enriched, by the successive piety and affection of ages; yet see them now grouped into a whole, which rather seems to be the embodiment of some one exquisite sentiment, springing from a single mind, and developed in harmonious beauty, like a flower expanding, veined and streaked from the principle of loveliness within it, than the gifts of various benefactors, and the works of various architects in different times, without acknowledging that it is an offspring of the love of learning, and the feeling of beauty, and the reverence for the good and the great, which form a glorious part of the national character of England, and have thus sprung, and blossomed, and ripened here. What should we think, even of a foreigner, visiting Oxford for mere curiosity, who should turn with disgust from its colleges, monastic looking buildings, in which the students are 'sentenced to reside,' but dwell with fond admiration upon its streets as 'beaming with modern intelligence,' 'macadamized'—filled 'with handsome shops,' and 'traversed by the mail!'

"There was much in this (to me) extraordinary attack on our educational system, as I read it, among some of the disciples of the system, whose excellence inspired it, which made me almost suspect as I read it, that the edition had not only been pirated by foreign cupidity, but interpolated by foreign taste. I was perplexed to find an English gentleman prophesying that 'if our aristocracy, with the Ghoul's horrid taste, will obstinately feed itself on dead languages, while the lower classes are greedily digesting fresh, wholesome food,' the lower orders will be governed no longer by 'classical statesmen.' And to see him asserting, that against popular discontents, 'our simple and only remedy is, by resolutely breaking up the system of our public schools and universities, to show the people that we have nobly determined to become enlightened too' that is, to become land measurers, arithmeticians, 'chemists and buffoons,' with a smattering of a hundred things, a knowledge of a few, and the conceit of knowing all.

"I participate in no such apprehensions. On the contrary, it is delightful to see the influences of classical learning not fading upwards, but penetrating downwards, and masses of the people rejoicing to recognise even from afar the skirts of its glory. The name of that famous stream, to which Sir Francis Head reverts with so much contempt, happily pronounced before thousands at Manchester, at the last anniversary of its Athenæum, by a man of genius capable of embracing the highest associations, and of sympathising with the lowliest, instead of exciting scorn, tended to heighten the effect of a noble endeavour to dignify and to refine those who are surrounded by care and engrossed by labour, and who were delighted by new veins of sympathy opening between their own lives and those which happier leisure had adorned with a more serene knowledge of immortal things."

GIBBON.

"There is, it seems, an Hôtel Gibbon here, partly standing on the site of that garden in which the historian took his evening walk, after writing the last lines of the work to which many years had been devoted; a

walk which alone would have hallowed the spot, if, alas, there had not been those intimations in the work itself of a purpose which, tending to desecrate the world, must deprive all associations attendant on its accomplishment of a claim to be dwelt on as holy. How melancholy is it to feel that intellectual congratulation which attends the serene triumph of a life of studious toil, chilled by the consciousness that the labour, the research, the Asiatic splendour of illustration, have been devoted, in part at least, to obtain a wicked end—not in the headlong wantonness of youth, or in the wild sportiveness of animal spirits—but urged by the deliberate-hearted purpose of crushing the light of human hope, all that is worth living for, and all that is worth dying for, and substituting for them nothing but a rayless scepticism! That evening walk is an awful thing to meditate on; the walk of a man of rare capacities, tending to his own physical decline, among the serenities of loveliest nature, enjoying the thought, that, in the chief work of his life just accomplished, he had embodied a hatred to the doctrines which teach men to love one another, to forgive injuries, and to hope for a diviner life beyond the grave; and exulting in the conviction, that this work would survive to teach its deadly lesson to young ingenuous students when he should be dust. One may derive consolation from reflecting that the style is too meretricious, and the attempt too elaborate and too subtle, to achieve the proposed evil, and in hoping that there were some passages in the secret history of the author's heart which may extenuate melancholy error; but our personal veneration for successful toil is destroyed in the sense of the strange malignity which blended with its impulses, and we feel no desire to linger over the spot where so painful a contradiction is presented as a charm."

REFLECTIONS ON AN UNSUCCESSFUL ATTEMPT TO ASCEND MONT BLANC.

Two questions will be asked by those who think the attempt worthy their consideration. Was it justifiable? and was it required? I venture to answer both in the affirmative, with the hope that I am right as to the first, and the certainty that I am right as to the last.

"It is the fashion for those who have never felt the passion for ascending Mont Blanc to deal out heavy censures against those who have made the venture, as wantonly risking their own lives and tempting the guides to risk theirs, without any adequate purpose. Mr. Murray's Guide Book, which, without offence, I may consider as the virtual representative of all the respectable commonplace on this subject, in one of those few passages which guide to nothing, and which, with the quotations from Lord Byron, may be regarded as *taxa* on the first necessary of travelling life, thus sums up the case against us:—'When Saussure ascended to make experiments at that height, the motive was a worthy one, but those who are impelled by curiosity alone are not justified in risking the lives of the guides. They tempt those brave fellows to encounter the danger, but their safety, devoted as they are to their employers, is risked for a poor consideration. It is no excuse that the employer thinks his own life worthless; here he ought to think of the safety of others; and yet scarcely a season passes without the attempt.' I cannot agree in the facts suggested in this passage, or in the inferences drawn from them. There is danger to be sure; that is, the possibility of serious accident, as 'tis dangerous to ride, to walk, to take a cold; as there is more danger in sliding on the ice than on dry ground; or as it is dangerous to go into the water before you have learned to swim; but I do not believe there was more danger in our attempt than in penetrating the glaciers to the Jardin; the difficulty was the fatigue, not the danger. Doctor Hamel and his friends, who persisted in ascending after a storm had shaken the snows and detained them for a whole day at the Grand Mulets, might not be able to acquit

themselves of blame when the fatal result occurred after all appearance of danger had passed; but I was assured by the *chef*, and by all the guides, that there was no more danger than always attends walking on the ice among crevices, and to the guides, who are accustomed to such exercise, none whatever; and I saw nothing to prove this judgment erroneous; indeed, I never felt any danger, except that of being obliged to turn back; unless, indeed, when I was carried by my mule into the thicket on a path which no moralist, even if he had been director of an insurance company, would have forbidden to a life insured in his office. The rule seems to be sustained by an unjust exception in favour of scientific experiment, as if there were nothing else worthy encountering risk for! Surely the desire to penetrate into the profoundest recesses of the universe, and expound their wonders to others, to acquire some knowledge of the greatness of its most marvellous objects beyond that expressed in mere figures of distances, in the hope to associate these with kindred thoughts, born of their majesties, is as worthy an object of risk—if risk there were—as to ascertain the density of the air at a given height. As to the hazard of the guides, which, except in expeditions undertaken against their judgment, is inconceivably small, I may ask whether every occupation must be stripped of all that elevates it and makes it heroic—and whether any occupation can be truly heroic that has not in it something of danger? When Luckie Mucklebacket replies to our old friend Mr. Jonathan Oldbuck's expostulation on the dearthness of her fish—'It is not fish you are buying, 'tis men's lives,'—and is terribly justified by the catastrophe which follows,—do we wish that fishermen should always keep their boats hauled on shore except in weather when no storm is possible—lest some brave young fisher lad should meet poor Steenie's fate? O, no! life is a thing of hazards, or it is not life; but such stuff 'as dreams are made of.' Nor is it just to the guides—venal as their professional courtesies and bravery, in one sense, are—to represent them as being tempted only by the pay to encounter the unavoidable labours and possible dangers of the ascent. They love the enterprise;—not merely the sense and praise of success;—but the actual intimacy they acquire with the mountain, which has covered over their infancy; the glory of their native vale, and the daily wonder of their lives. I can bear witness, that, at least in our case, there was no reluctance to overcome; for although I kept my purpose as secret as I could, I was pestered by applications from guides, who having guessed it, wished engagements; and only escaped them by refusing to engage any, and referring them entirely to the *chef*. For myself I can truly say, that in making the attempt—although it was foolish enough in reference to any chance of accomplishment—I was prompted by no idle wish for distinction; nor, if I had succeeded, should I have thought myself entitled to boast of any feat of physical prowess. On the contrary, so great are the appliances supplied by the guides to a person who has not the strongest and justest self-reliance; so much is done for him, so little by him: he is so aided at every step; so supported, dragged, all but carried; that it seems to me a process more effeminate than manly, and by no means so unsuited to the nature of the ladies who have been among its achievers, as at first sight appears. With Mr. Bosworth and Mr. Nicholson, it was a real self-sustained effort; but with me, even as far as I went, it implied little more than the capacity of moving and enduring. My motive was an earnest love of nature, heightened in this instance almost into passion by the kindling perusal of many tales of the ascent, an ardent longing to unravel the mystery of a mountain which I believed to be unrivalled in Europe, but which to the eye seemed surpassed in height by many nameless hills; and this I esteem as worthy a motive as the wish to make experiments with the barometer.

"And was the effort, notwithstanding the failure of its loftier aim, repaid? Yes; richly. Except the panoramic views from the summit, which, even when unveiled, the successful adventurer has rarely the physical power to appreciate, I believe I obtained all the real fruits of the expedition; for I saw enough of the waving path above me to understand its majesty; and beyond my ken, there could be nothing greater. I know not what the mountain is; how it sits crouched, like Queen Constance, 'on the huge firm earth,' as if to hide its immensity from the superficial gazer. The object itself is so vast, so compressed to the eye between earth and heaven, partaking of both; so wonderful in the contrast between its ascertained immensity and its apparent lowness; that it is the acquisition of a great idea to understand at least enough of its foldings and recesses, to be able to image the rest. Viewed from Chamouni, the evening before I started, it was scarcely possible to believe it the monarch of European mountains;—it suggested associations rather of beauty than greatness; resembling a gigantic mosque, with its minarets and domes, such as might almost have been made with hands. With what different feelings did I gaze on it the evening after my descent, when the want of aerial perspective was supplied by pain-bought experience; when a faint, dark streak, bordering the glacier, denoted the enormous gully; when the line of fretted white, on which the Grand Mulets seemed before to rest, expanded out into the mighty bosom of the rock-bound glacier, with its unfathomed crevices, and roar of hidden rivers, and all its border ice-caves of fantastical beauty; when the brown rock, presenting the aspect of a small penthoused window, rose before me, the fortress lord of ten thousand acres of snow; when beyond, on the upward tract, 'wilds immeasurably spread seemed lengthening;' and the small knot, which forms part of the figure called the Dromedary's Back, 'rose the snow-dome of the star-lit solitude!' It may be said that I knew before that the mountain was more than 15,000 feet above the level of the sea, or, which is more to the purpose, 13,000 feet above the floor of Chamouni; but such knowledge was of no more worth than the distance of a star from the earth, in which hundreds of millions of miles are just worth to the imagination the line of cyphers which represents them in the table. In explaining such an object, the reality expands the imagination; the details, instead of detracting from the general impression, infinitely heighten it,—perhaps the best test of all physical greatness, which is built up of things individually grand, and not mere vague outline;—so that the idea of Mont Blanc is to me no longer a mere diagram, but a living verity. Then there was the evening at the Grand Mulets, crowned by an imperishable vision, and followed by the midnight aspect of the heavens, which here, surveyed from a spot above the impurities of the denser atmosphere, assumed a darker hue, and justified the Homeric description, 'Ether all opens;' and though it is true that the same glory would have been vouchsafed if this rock had been the summit of my ambition, still it would not have been attended with the same interest, half wild, half solemn, which surrounded it as an incident in the greater adventure. Although, therefore, the attempt cost about a thousand francs, a day's scruples, and another day's misgivings; some slight sense of disappointment at the moment of return; and some hours' labour, amounting to suffering; I rejoice that it was made. The suffering was no doubt severe; but, as far as it can now be recollected, it aids in realizing the tracks along which it was borne; while the earth grandeur, the cloud visions, and even the physical relief and enjoyment of the way will enrich the past, so long as it shall have power to cast sweetness on the present and the future."

ADVANTAGES OF FOREIGN TRAVELS.

"In estimating the wealth with which the mind may be endowed by excursions as rapid as these into foreign

lands, I think it will be found to consist almost exclusively in the images which the scenes of the external world have impressed upon it, and in the feelings they have excited. It would be obviously absurd to hope that, from intercourse so transient and imperfect as the railway carriage, the steam-boat, and the table d'hôte allow, any knowledge of the character of the people of the fair regions at which a holiday traveller glances can be acquired beyond a few picturesque aspects of glancing light and shadow. You cannot, indeed, pass through any section of Germany, however rapidly, without becoming sensible to the charm of that unaffected good-nature with which all classes seem imbued; associated in the women with a quiet serene grace, a benevolent repose of manner; and in the men, especially the young students, with a brotherly affection for each other, and a disposition to be, and to make happy, which refers their university duels to the mere tyranny of custom. Indeed, the gashes which these encounters have left, may generally be observed scarring faces which beam with good-humour, and show how little concern hatred, or envy, or any real passion, has in producing those passages of foolish bravery. In Switzerland it would be a sad waste of precious hours to spend them in endeavouring to pluck out the heart of the mysteries of character which lie within the human forms which are dwarfed by the mountains among which they move and perish, while the mountains themselves, with the snows they sustain, and the streams they nurture, freely expand to the gaze and invite the eye, the heart, and the imagination to concur in holding the most intimate communion with their grandeur.

"But the knowledge of scenery which is achieved by such excursions, is all clear, unalloyed, and priceless gain, for it not only enriches the chamber of memory with the pictures which can be expanded at will, but nourishes the power of appreciating all other kindred scenes, and redoubles the charm of those we may afterwards enjoy at home."

THE PLEASURE DERIVED FROM THE CONTEMPLATION
OF FINE SCENERY.

"The pleasure which is derived from the contemplation of fine scenery is, I apprehend, nearly in proportion to the power with which the mind grasps its colours and forms, and realises a kindred between their attributes and its own. The mere presentment of the mightiest external varieties of the earth's surface to the eye of curiosity, except in the comparatively rare instances when they melt into harmonious pictures, can excite at most only a sort of stupefied wonder. To the youth of a poet, gifted with a peculiar sense of beauty, they may be, as they were to Wordsworth, a passion, 'an appetite, a feeling, and a love:' though even then it may be doubted whether the premature development of deeper sources of pleasure has not unconsciously blended the spiritual with the external. But to children in general, the book of nature spread out before them in all its wildest sublimities, lies unread; and it is not until they have begun not merely to think and to feel, but to reflect on their own past thoughts and feelings, (which they have gradually associated with the scenes in which their emotions have been born and cherished,) that they begin to understand and to love the world without them. In this respect the experience of every youth of sensibility and reflection is a picture in little of the history of his species. Old as the world has grown in the arts of life and death, and early as divine inspiration enkindled the spirit of poetry in its favoured inheritors, it is only in times comparatively modern that the mind seems to have awakened to a sense of its external grandeur. In the Hebrew sacred poetry each image is singly contemplated as attesting the glory of God, or is employed as the symbol of his terrors. The breath of a pastoral simplicity is wafted from the depths of patriarchal ages; Mount Sinai flashes with the terror of the law; and the harp of David sometimes trembles with the

sweet influences of sky and earth; but there is no picture, enriched by the heart's experiences, to break the elementary vastness of the imagery in which the voice of eternity is heard. In the Homeric poems, all-vivid as they are—

'As full of spirit as the month of May,
And gorgeous as the sun at Midsummer,'

the pictures are of the camp, the battle, the city, the fleet—not of the mountain and flood; and the frequent similes by which they are studded, instead of indicating an aptitude in the poet's mind for informing the shapes of the universe with life and passion, or clothing human affections and powers with the aspects of matter, show, by the imperfect associations which often introduce them, and the mosaic air they give to the composition they variegate, how faintly the sympathies between the world of matter and of thought were perceived even by the genius which inspired them. As the poetry of Greece became more refined, the sentiment of scenery was still further refined, until it was lost in the tendency to make all things subservient to the beauty of form. It breathes again in Virgil, but still with a subdued and courtly sweetness, and scarcely is felt again till it bursts out in lusty life in Chaucer. Hence, after mingling with the flush of Elizabethan genius, enriching the passion of Shakspeare, mantling in the luxury of Fletcher, and embossing the stateliness of Milton; it was crushed by the iron sense of Dryden, dissipated amidst the artificial brilliances of Pope, and feebly held its obscure way beneath the frost-like etiquette and sparkling conceit of our Augustan age. In the revival of the true poetical spirit it has expanded triumphantly among us, breaking forth into gorgeous enthusiasm in Thomson, becoming coldly pure in Cowper, shedding a consecrating influence on a multitude of glorious scenes in Scott, and enabling us to consecrate all scenes for ourselves by the teachings of Wordsworth. No one can doubt that the deeper seriousness which Christianity has shed through our human life has attached itself to the silent forms of nature, and has given them an interest which, reflected and reduplicated by our poetry and romance, is now not confined to men of genius, or even to men of thoughtful leisure, but is felt more or less vividly as a pervading sentiment of common existence, gleaming in upon the busiest hours, and deepening the long-drawn sigh for repose from the bustle of the world, with a longing after the visitations of beauty and the approaches of wisdom."

THE NANT D'ARPENAZ.

"The Nant D'Arpenaz is the fall of a small rivulet, which gushes down unscathed through fissures of the lofty rock; then, in mid-air, leaps from it; and, meeting immediately with little projections, is dashed into fine atoms; floats off some two hundred feet from the ground in an everlasting yet ever changing feather; and though a portion of the water may be caught by the lower rock and may drizzle down it, the body of water actually disperses; makes itself 'air into which it vanishes.' It is like a spirit embodied—no, not embodied, shaped—'breaking from the rock; ever perishing, yet ever renewed; an image of purity, evanescence, duration.' Its substance is as slight as its identity: the most ethereal of all things which in any sense endure light,—as the 'snow-fall in the river;' or a wreath of smoke, yet existing as a waterfall for thousands of years,—the Ariel of inanimate matter! I gazed back upon it till it looked like a speck of gossamer cloud; and sighed for it even while the vale expanding wider and wider, and becoming grander and grander, dazzled me with its luxuriance and its brightness."

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

THE GRAVE IN THE VILLAGE.

W. BRAILSFORD.

Not in the city—not in the crowd,
Where the voices are ever stern and loud;
Where the busy money-changers make
Golden moments for lucre's sake;
Where life is hurried, where noise and glare
Contend alike in the dusky air,
Be my resting-place—not there.

Rest! hath it ever a symbol shown
In those thick close streets, in those eager looks,
That have not of health a trace or tone,
Like the grass that waves in their smoke-dried nooks?
Rest! 'tis a hallowed thing,—no part
Has it in the monster city's heart:
Turmoil and bustle, clamour and din,
Stormy passion, and riotous sin,
These are not surely for rest—oh! no,
Such records of the strife below
May be for action, but are not rest—
They are not blessings—are not blest.

It is true I am young, but my thoughts grow old,
For they live where the shadows are falling over
Fragrant woods, and blossoming clover,
Bright sea billows, and sheaves of gold,
Where the bee wooeth his blooming bride,
Where the heather shines on the green hill side,
Where the village bells ring out for prayer,
And the jubilate fills the air.
Beside the path where a boy I trod,
With a serious thinking upon God;
Beside the graves where my fathers sleep,
Where the shepherd seeks his wandering sheep,
And the glow-worms their evening vigil keep;
Where the solemn yew, with its stately bend,
Seems to welcome each feathered friend,
As its joyous carol floats on high,
An unpaid grateful minstrelsy,

There—there let me lie!

For I have a wish—that, though each sense
In death may lose its influence,
And feeling sympathy be nought,
Some glimpses into the past be caught;
An old scathed tree, a pale flower near,
Or a leaf that memory made dear,
Or a rippling stream, or broken ground,
Be by my last home's grassy mound,
That wayfarers may pause and say,
This by-gone and forgotten clay
Mayhap had constant friends, and these
Were his familiars—so let pass
A gentle greeting on the breeze,
And win new thoughts from Time's old glass,
So let me lie!

THE STUDENT.

"Why burns thy lamp so late, my friend,
Into the kindling day?"
"It is burning so late, to show the gate
That leads to Wisdom's way;
As a star it doth shine on this soul of mine,
To guide me with its ray;
Dear is the hour, when slumber's power
Weighs down the lids of men;
Proud and alone I mount my throne,
For I am a monarch then!
The great and the sage of each bygone age
Assemble at my call;
Oh! happy am I in my poverty,
For these are my brothers all!

Their voices I hear so strong and clear,
Like a solemn organ's strain,
Their words I drink, and their thoughts I think,
They are living in me again!
For their sealed store of immortal lore
To me they must uncloze:
Labour is bliss with a thought like this;
Toil is my best repose!"

"Why are thy cheeks so pale, my friend,
Like a snow-cloud wan and grey?"
"They were bleached thus white in the mind's clear light,
Which is deepening day by day;
Though the hue they have be the hue of the grave,
I wish it not away!
Strength may depart, and youth of heart
May sink into the tomb;
Little reck I that the flower must die
Before the fruit can bloom.
I have striven hard for my high reward,
Through many a lonely year;
But the goal I reach,—it is mine to teach,—
Stand still, O man, and hear!
I may wreath my name with the brightness of fame,
To shine on history's pages,
It shall be a gem on the diadem
Of the Past, for Future Ages!
Oh, Life is bliss with a hope like this—
I clasp it as a bride!"
Pale grow his cheeks while the Student speaks—
He laid him down and died!

A Song of Pitcairn's Island.

Come, take our boy, and we will go
Before our cabin door ;
The winds shall bring us, as they blow,
The murmurs of the shore ;
And we will kiss his young blue eyes,
And I will sing him, as he lies,
Songs that were made of yore :
I'll sing, in his delighted ear,
The Island-says thou lov'st to hear.

And thou, while stammering I repeat,
Thy country's tongue shalt teach ;
'Tis not so soft, but far more sweet
Than my own native speech ;
For thou no other tongue didst know,
When, scarcely twenty moons ago,
Upon Tahiti's beach,
Thou cam'st to woo me to be thine,
With many a speaking look and sign.

I knew thy meaning—thou didst praise
My eyes, my locks of jet:
Ah! well for me they won thy gaze,—
But thine were fairer yet!
I'm glad to see my infant wear
Thy soft blue eyes and sunny hair,
And when my light is met
By his white brow and blooming cheek,
I feel a joy I cannot speak.

Come, talk of Europe's maids with me,
Whose necks and cheeks, they tell,
Outshine the beauty of the sea,
White foam and crimson shell.
I'll shape like theirs my simple dress,
And bind like them each jetty tress,
A sight to please thee well;
And for my dusky brow will braid
A bonnet like an English maid.

Come, for the soft low sunlight calls—
We lose the pleasant hours;
'Tis lovelier than these cottage walls—
That seat among the flowers.
And I will learn of thee a prayer
To Him who gave a home so fair,
A lot as blest as ours—
The God who made for thee and me,
This sweet lone isle amid the sea.—*Bryant.*

THE MERCHANT.

CHAP. I.

We might discover an interesting chapter of human life, well filled with curious facts, could we board that noble East Indiaman just entering the Plymouth docks, and read the hearts and the lives, as well as scan the features, of the anxious crowd who, gathered together on her deck, appear all impatient to land. Sceldom could we find more variety of character and circumstance.

We must, of necessity, mingle with that group, for from among it have we to single out the chief subject of our tale. Ah! now you cast a curious eye around. It is not that young dragoon, with twisted moustache, and sallow skin, who, on account of ill-health, is returning to join the depot of his regiment; nor is it that very lovely delicate-looking woman, who, for the same cause, has been sent by a husband, far more advanced in years, to reside for a while with his family in England, on whom the young soldier we have just mentioned is bestowing many little attentions, of the same class as those by which he has striven to alleviate the dulness of the long voyage to her. It is not that veteran hero who has fought on so many bloody fields; not that imperious judge, whose arbitrary behests are obeyed by his servants with trembling haste; nor is it that pale sickly widow, who presses her young child to her breast, and anxiously reflects on what welcome will await her and her orphan at the family hearth of him who was her protector and support. It is none of these (though each may have a tale to tell) that I am seeking earnestly. But I discover him now; and though you did not fix on him for a hero, and exclaim triumphantly, "This is he!" yet, when you mark him closer, you shall acknowledge that perhaps I have chosen well, or at least, that twenty years ago he must have been admirably qualified to sustain the character. Nay, reader, when you are as well acquainted with him as I intend to make you, you shall confess that (strange as it seems to talk of romance at forty!) he yet retains most of the necessary ingredients of a hero. You hinted at twenty years ago. Well, it is exactly twenty years since Edmund Neville quitted his native land, never to set foot on her shores till this very day; and at his departure he was all that you may suppose him to have been, from what you see now. Those locks, now whitened by a fiery sun, by arduous toil, by grief of heart, were then of a glossy chestnut; those lips, now habitually compressed, were then a smile of uncommon sweetness, into which they can still occasionally relax; those thoughtful, mournful eyes, then sparkled with hope; that well-proportioned figure, that wore an air of becoming dignity, had then an elasticity and freedom

of motion at once graceful and exhilarating to behold. No young adventurer ever set out with a more sanguine spirit than did Edmund Neville; and now he returns with feelings of loneliness and depression even far beyond those usually entertained by the exiles of many years. He had quitted England an orphan, but not, therefore, without leaving fond hearts to mourn at his departure. Destitute of fortune—loving passionately the beautiful sister of a friend, by whom he was in turn beloved, and who was as portionless as himself—he turned with the ardour of youth, and of a sanguine and energetic temperament, to bright prospects which opened to him in the East, promising to return in a few, a very few years, to claim Juliet Markham as his bride, and again to seek with her a golden land. It was twenty years ago that he gave that promise,—and it is yet unfulfilled. The most indefatigable application was rewarded by gradual advancement; but she for whom all his efforts were made, meanwhile sickened and died, while he laboured for her in a distant land, and did not learn, for months after the event, that she who animated all his endeavours had passed into that state in which all he could bestow could profit her nothing. Still he did not abandon his avocations; he was far too wretched to be idle. In vast and splendid attempts he ran bold risks, and amassed princely wealth. At length he wearied of his labours; he felt a yearning for his native land, and yielded to the impulse, though to do so at that moment asked the sacrifice of thousands. He set sail for England, and proposed, the moment he reached her shores, to seek the dearest friend he possessed in her, the brother of his betrothed,—a man happy in those domestic ties which Neville wanted, but slenderly furnished with the riches with which he was so amply supplied.

CHAP. II.

MR. MARKHAM, holding in his hand an open letter, which conveyed the welcome promise of Neville's arrival that very evening at the Grange, was standing with his wife before a picture representing a very beautiful girl in the costume worn twenty years before. Both gazed on it with mournful reflections. At length Mr. Markham said, "Shall we remove this picture, or shall we leave it here, Maria? Do you think that Edmund Neville will perceive Juliet's strong resemblance to it? Do you think the sight of it will distress him?"

"I know not what to advise," replied Mrs. Markham; "he cannot come here without being reminded of his youth; he must be aware of that, and yet, you see, he comes. If he must see Juliet, he may as well see the picture; it is one and the same thing."

"She is so exactly in age and person what my sister

was when he parted from her," said Mr. Markham, thoughtfully and sadly,—"so exactly what, he may imagine her to have been when grieving over his absence. Poor Juliet! had he come a few months ago, when she was gay and happy, he would not have found a resemblance so distressing!"

"Does he ever mention his betrothed to you in his letters?"

"Never. He is one of those who never speak or write on subjects on which they feel acutely, unless duty calls for the exertion."

At this moment a pretty child ran into the room. "Tell me, dear papa," she said, "is the great 'Indian Nabob' really coming to see us?"

By this name the wealthy merchant often went in his friend's family, and it conveyed very mysterious ideas of him to the younger members of it. He was half identified in their minds with the strange idols which once arrived in one of the boxes of rich Indian curiosities which had often found their way to the Grange. Little Marion, having procured an answer to her first question, had still an important one to propound.

"Papa," she said, "we all very well know how beautiful and good Juliet is, and that she deserves much more than any of us; but how did Mr. Neville guess this, that he should always mark all his prettiest gifts with her name?"

Her father patted her cheek, amused by her earnest curiosity, and replied with a smile, "Probably the benevolent fairy who presided at her christening, and gave her all her good gifts, floated across the ocean to whisper this in the ears of the Nabob, Marion; what do you think?"

"Why, I really think that is very likely, papa," cried Marion, who loved the marvellous, and in her merry mood always feigned to credit the wildest fancies with which her favourite books abounded; and those favourite books, I almost fear to confess it, were no other than the Arabian Nights and other tales, with which I and those of my generation were allowed to delight ourselves; and which Mr. Markham, remembering the exquisite pleasure which he had enjoyed, had the good nature, if I may not say the good sense, to let his children enjoy also. And now Juliet entered; and you, my reader, seeing her thus for the first time, will wonder why Marion talked such nonsense as to call her beautiful, and why Mr. Markham appeared to hold the same opinion. Why should this pale girl, with her sad and serious countenance, and her listless step, be termed beautiful? Wait a little; perhaps she will raise those drooping eye-lids, fringed with their long black eye-lashes; then shall you behold eyes of a wondrous lustre—large, liquid, grey eyes—that beam with intellect and with feeling. Perhaps she will speak, and you will see a brilliant glow mount up on her cheek, and fade away again as quickly; you will see two rows of pearly teeth; and, if Marion can make her smile, you will see a hundred dimples play around her mouth. Ah! if you had beheld her a few months since, I need not have written all this to convince you that she is lovely.

Juliet has not yet seen her nineteenth birth-day. What can have worked so great a change in one so young? Nay, reader, why ask the question? Sure I am that every one who reads this passage can answer it. It is true that the heart of youth is not easily cast down; it triumphs over dangers, difficulties, hardships, sufferings, poverty; it recovers the loss of friends, the defeat of projects; it can hope on, and continue to pursue the happiness which has a thousand times eluded its grasp; it can do all this, but there are pangs at which older hearts mock, and at which it will mock too, in its turn—pangs which, to the young, fresh, ardent heart, are as the severing of soul and body, incomprehensibly agonizing.

And Juliet, this beautiful young girl, what is it but

that she has drunk the first draught of the bitter waters of Marah—the waters of disappointment? And before she tasted of them she fancied herself in the garden of Eden, so happy and rejoicing was she; but now it seems to her that she has suddenly discovered herself to be a wanderer and an outcast in the waste howling wilderness. Now may she, with George Herbert, say, not repiningly, but with a grateful, though a broken, spirit:—

"At first thou gav'st me milk and sweetness—
I had my wish and way;
My days were strew'd with flowers and happiness—
There was no month but May;
But with my years sorrow did twist and grow,
And made a party, unawares, for woe."

Juliet, languid as she was, shared the eager wish for the arrival of her father's noble-hearted merchant friend. She knew well the history of his early love and grief, and could trace in memory a fair vision of her aunt, which she cherished with the utmost tenderness. Everything that remained of her, in the hearts and minds of those who had known and loved her, and in the memorials which she had left behind, conveyed the impression of so much tenderness and truth, such meekness and devotion of spirit, such touching resignation, that Juliet could not but believe that she had been a being rarely equalled, and never to be forgotten. She felt that she could conceive and sympathize with the feelings of him who was now about to return to her home, and would find her not. She contrasted their fates with her own; and, though she wept for them, the tears which she shed for herself were far more bitter. They had loved with unbroken constancy and unshaken trust. Juliet sickened as she remembered the beautiful image which had once been enshrined in her heart, and then looked on it disfigured and dethroned, lying in shame and degradation in the dust; and, first to love, and then to despise,—Juliet thought that no dart from the quiver of Death could inflict a wound like this.

CHAP. III.

At length evening came, and with it came Mr. Neville, and the merchant was quite unlike what any one of the expecting group had supposed that he would prove. Mr. Markham, who had parted from a fiery enthusiastic youth, was scarcely prepared for the calm dignity of his manhood. The children, who regarded him from a distance with something of the awe and curiosity which a Bengal tiger might inspire, were amazed by the sweetness and gentleness of his voice and manner. Juliet had not thought that he would look so old, but, in spite of his whitened hair and bronzed skin, the unquenched fire of his dark eye, the whiteness of his teeth, and the freedom of his movements, quickly removed the impression of advanced age. Mrs. Markham was surprised to find him so young.

After the first warm greeting of the friends was over, and the feelings excited by it had partly subsided, Mr. Neville showed how desirous he was to make acquaintance with each member of the little group. Juliet was quite in the background, and her little brothers and sisters crowded round her, and completely shut her out from view. Her father put them aside, and called her to him. She well knew the tide of painful associations which must fill the stranger's breast on hearing her name, and on beholding her for the first time. She advanced with head and eyes inclined downwards; her raven hair was drawn back from her classic brow; the colour mounted visibly on her cheek, then rushed back, leaving her colourless as marble. She breathed quickly with agitation. Her father glanced at his friend as she approached. He saw him start, and briefly, but tenderly, he said:—

"This is my eldest child, my Juliet."

Taking her hand, he placed it in that of Neville, and by a kind pressure spoke his acquaintance and sym-

pathy with all that was passing in his breast. Neville was as in a dream;—one of those heart-sickening dreams in which we act over again the happy scenes of youth.

"Oh, miserable power to dreams allowed!"

None of the supernatural horrors, the terrific perils, which we often encounter in sleep, cause half the pain which we experience in retracing reality step by step!

Juliet felt Neville's hand tremble; the moment that she could withdraw hers, she fell back, and a few hot tears rolled down her cheek unperceived.

Neville grew absent in his replies, and declined all refreshment, though he had travelled far. His friend interpreted these signs as weariness, and conducted him to the chamber prepared for him. When alone together, they could not abstain from retrospections of the past. At length Neville himself alluded to the perfect resemblance which Juliet bore to her whom he had left as fresh a flower, blooming in the same soil. As he spoke his countenance changed, his manly voice faltered. Emotion banished self-possession. He resolved that this comment should be made for the first and last time. He would never again venture to approach this subject.

When Neville was left to himself, he found it impossible to obtain rest. Old recollections haunted and agonized him. Visions of an hour's birth flitted before him. In vain did he attempt to separate the Juliet who was not, and the Juliet who was. He trembled on the brink of a discovery, that to him they must henceforth be the same. He passed a night of restless pain, shamed and harassed by this strange intermixture of the past with the present. He rose with the dawn, and threw open the window of his chamber to breathe the morning air, which seldom fails to refresh the sickest head or heart. He gazed forth on a scene once so familiar to him, and retraced with little difficulty every feature of it. While thus employed, he forgot the lapse of time. Suddenly the sound of the church-bell struck his ear. What village ceremony is about to take place? He felt a superstitious desire that no funeral train should meet his eye, as the omen attending his first return to the Grange. He was diverted from his fears by beholding his host issue from the house with his family, and, quitting the garden, take the winding path over the rising common, which he so well knew led immediately to the church porch. He quickly descried among the group the slight form of Juliet. He saw, too, how the younger children hung about her with fondness, and her father drew her tenderly to his side. Neville's eyes were fixed upon her till she disappeared among the trees which bounded the common. Then he covered his face with his hands, and in his loneliness he wept. It was as if he had returned to find Juliet in unimpaired youth and beauty, while, in himself, all freshness of feeling, all liveliness of hope, all elasticity of spirit, had been numbed by the touch of time. The contrast was bitter.

CHAP. IV.

NEVILLE was roused from his deep reverie by the merry shouts of the children as they came bounding over the common on their return. The merchant prepared to join his friend, and, after their first greeting, asked an explanation of the proceeding he had witnessed. "Was it not uncommon?"

"No, not uncommon," replied Mr. Markham; "for it is of daily occurrence. At this hour Mr. Villiers, the excellent clergyman whom we have now possessed more than six months, performs the Morning Service, and many, with little detriment to their necessary avocations,—though few, I believe, without some slight self-sacrifice,—are able to attend. We find it the most beneficial, the most pleasurable mode of commencing the day that we can follow."

"To-morrow I will so commence it with you," replied Neville, readily; and Juliet, who had just reached the spot where they stood, was pleased with the cheerful alacrity of his voice. Neville's eye rested attentively on

her as soon as she appeared. Her cheek was glowing, and her eyes were sparkling, with the exercise she had taken; but he watched all this brilliancy fade away, and an expression of mournful resignation overspread her countenance. "She does not look happy," he thought; and throughout the day he could not banish from his mind this distressing supposition.

The time past chiefly in familiar conversation between the two friends; by which, in a few hours, they realised the existing circumstances of each other more than they had done in the correspondence of years. Neville found that Markham enjoyed few of the superfluities of life. His children were frugally reared, and simply attired, which added vigour to their health, and charms to their beauty. His sons were carefully educated, and were already fitted for introduction into the world; to advance their fortunes Neville resolved should be his earliest care. Juliet owed chiefly to her aunt and god-mother a cultivation of mind and taste which might be a solid basis for further acquirements. Nature had gifted her with talents for the arts which she had formerly exercised with great delight, though with little knowledge; but that delight did not now exist. Her most pleasing occupation now was the instruction of her little sister in such rudiments as she could impart; and she was no unskilful teacher, as the progress of the lively, intelligent little Marion evinced. Neville saw, with vexation, that while Juliet welcomed him with all the cordiality due to her father's friend, yet, as much as possible, she withdrew from the conversation generally held, and her silence was less that of timidity than of abstraction. Clearly to ascertain whether the grief which he suspected did or did not exist,—if it did, to proceed to the discovery of its cause, and finally to relieve it,—became, ere evening, Neville's prevailing wish and design. But he was resolved that the impression made on him should receive corroboration solely from his own observation, and, actuated by delicacy, he abstained from communicating his doubts, by the slightest hint, to the parents of Juliet.

The following morning found him walking at her side towards the village church. She conversed with intelligence and animation until her father overtook them. Then she immediately fell back, and walked and talked with Marion, evidently with more real satisfaction. But in the church they were again side by side, and Neville could not but be sensible, that while they joined in the most impressive prayers which man ever framed wherewith to address his Maker, Julia wept—silently,—as secretly as might be,—but, calm as she ordinarily was, she could not here wholly restrain the emotion which betrayed a heart full to overflowing. Neville's first inquiry was answered.

(To be continued.)

HISTORY OF THE COTTON MANUFACTURE.

It has long been acknowledged, that from the simplest matters the most important results may flow. Nor is this true in one province of human affairs only, but continually exemplified in the great departments of morals, politics, arts, and science. Some remark uttered carelessly, some thought lighting upon the mind in a moment of reverie, may produce changes in the laws and constitutions of empires, affecting the condition for good or evil of myriads of men through a long course of ages. Thus in human society we see great things rise from little. And this is clearly the law in the material world; the Nile springs from a brooklet, over which the Abyssinian boy can leap, and Egypt herself has risen from the muddy deposits of a stream; whilst an insect, silently working in the deep sea, creates a whole polynesia, and covers the ocean with a thousand coral isles. A similar exemplification of the law of growth

appears in the history of all human works; the first untutored man who launched a hollow tree on the waters for a canoe, was a naval architect certainly, and stands in the same class with Sir Robert Seppings; but how numerous were the steps between this rude vessel and our modern war-ships! Nowhere, however, is the progress from the first rude step to the magnificent development more remarkable than in the cotton manufacture. Startling is the contrast between the old woman working at her distaff, and the mighty machine turning its 2,000 spindles, and forming, with magical celerity, more than 160 miles of thread from a single pound of cotton. The concentration of power upon one object, the many applications of a single machine to numerous purposes, and the perfect command exercised over the thousand movements, combine to excite the admiration of all who walk through a cotton factory.

All classes have an interest in this branch of British manufacture, from the peasant boy, or servant girl, whose comforts are advanced by its soft, white production, to the statesman who recognises a powerful element of national prosperity in the imports and exports dependent upon the cotton loom. Nor will the patriot and the Christian be inattentive to the great social changes resulting from a manufacture which has caused populous towns to rise in the midst of once silent valleys, and thereby drawn into vast masses the once scattered population of a district,—disorganizing old modes of life,—creating a necessity for new means of education, and supplying fresh powers for good or evil to the nation. Let us then trace the history of the cotton manufacture through its more remarkable stages of transition, to the fully developed condition now presented by this branch of human industry.

What is the first state of cotton, and what does it resemble before making its appearance in our country? The soft substance which we call cotton, is taken from the pods of a tall shrub, classed by botanists in the genus *Gossypium*; in which are found nine or ten species of this plant. Those who have studied the botanical system of Linnaeus, would place it in the class Monadelphia, and the order Polyandria. The seeds are taken from the pods, and dropped into holes, where the plants soon appear, and in about eight months produce their first crop of that soft material, for the safe transport of which many a ship is employed, and on its arrival so many hundreds of thousands depend for subsistence. The cotton is, in reality, nothing more than the seed wrapper; its soft substance surrounding the ripe grains, from which it is separated by an instrument after removal from the pods. These pods are about the size of a filbert, and burst when ripe, disclosing the cotton, which is gathered and prepared for packing. A further notice of the plant itself would seem superfluous: let us therefore leave the whole process of packing and shipping to those whom it may concern, waiting the arrival of the cargo at Liverpool, and the removal of the bales to the factories of Lancashire and Yorkshire.

It is evident, that the newly arrived vegetable down needs considerable preparation before it can be delivered to the care of the spinner, for, having been closely packed in tight bales a long time, the whole is matted together in one dense mass. It is therefore subjected to the operation of a machine fitted to tear open the tangled cotton, and free it from the dirt which may have become mingled with it. Having undergone this preliminary loosening and shaking, the cotton is prepared for the "scutching machine," by which it is still more disentangled and cleansed, being beaten by flat pieces of metal, which move with the rapidity of 1,200 revolutions in a minute. When the cotton is thus thoroughly opened and expanded by the "spreading machine," it becomes ready for the important operations upon which its utility and beauty depend. One of these, and a necessary preliminary to spinning, is *carding*, which consists in spreading out all the cotton fibres in one direction, that the woolly mass may be smooth and

ready for the first stages of the spinning process. This was originally performed by *cards*, in which were inserted wire teeth, when, the cotton being laid upon the lower card, and the teeth of the upper drawn like a comb across the entangled mass, the different fibres are drawn in the direction towards which the card is moved.

Carding was formerly performed by the hand; but a machine was subsequently invented, in which the loose cotton, being laid upon a revolving toothed cylinder, and pressed against a card fitted with wire teeth, is gradually placed all one way. A small roller covered with teeth snatches off the carded cotton from the large revolving cylinder, and conducts the soft fleecy band between two rollers which compress it into a closer substance. In this state the cotton, called a *roving*, or *sliver*, falls into a vessel placed beneath the roller, ready for the application of the spinning machines. The *slivers* taken from the old hand cards were only a few inches long; but those produced by the modern carding machine extend hundreds of yards in length, and a constant supply of cotton is furnished by means of a revolving cloth called the *feeder*. This brings the beaten cotton from the scutching machine to the toothed cylinder. The next operation is called *drawing*, and consists in combining several slivers, and then *drawing out* these conjoined threads, so that the whole sliver shall not exceed the thickness of the original separate pieces. Thus, several slivers being drawn through rollers, and so reduced to a greater fineness, are united by passing through a funnel, by which the line is increased in thickness and strength. The cotton next undergoes the operation called *roving*, in which several slivers are joined together as by the drawing process, but the roving machine gives a *slight twist*, this being the first step in the spinning. To describe all the peculiar details of *roving*, without reference to working models, is impossible. But the principle combines the three acts of uniting several slivers, drawing out the thread thus formed, and giving a slight twist to the loose material. Suppose four slivers are joined in one, and then drawn out to four times the length of this one, it is evident that the single resulting sliver will equal the lengths of the four from which it is formed. Again, let four of such compound slivers be combined, and stretched to four times the length, it is clear that the combined thread has no less than sixteen distinct slivers in it. These successive combinations and drawings are important, as they secure an equable thickness throughout the whole length of the thread. So numerous are the operations necessary, even before commencing the work of spinning. These scutchings, cardings, drawings and rovings involve an amount of labour and skill, of which few who use daily the cotton thread have any conception.

Before proceeding to the various machines employed in cotton spinning, we must pause to notice the early state of the cotton manufacture, and contrast this with the present amount of its production in England; we shall then be able to appreciate the powers and the value of the inventions which have effected the change. It is scarcely necessary to remind our readers that the cotton manufacture is of modern date; for, though forming a branch of trade many centuries ago, it is only in later days that it has developed its powers, and created for itself a kingdom in the world of art.

The former state of this manufacture may be most forcibly contrasted with the present by a simple line of figures; for though these strict unbending little signs may not have much poetry in them, they deal in the most convincing of all logic, and utter the most powerful of all statements; nor is deep poetry, even the most solemn and significant, far from those figures which so often hint with sublime brevity a nation's history. Sixty or seventy years ago, a period within the recollection of some now living, the cotton manufacture consumed annually 3,000,000 lbs. of raw cotton; and this, no doubt, seemed a vast amount to many at that time.

The child sitting on the violet bank beneath the hedge-row, and watching his elder sister turning merrily her spinning wheel, would be amazed when told by his father that such a weight, so overwhelming in its vastness to their simple minds, was manufactured into cloth.

Men, too, grave seniors, looked suspiciously toward the cotton lands, and loved them not;—enough was already done in this matter, more was unsafe. Too much of such work seemed ominous; certain coming events were looming through the mists of the future; and somehow the whirling wheels of the mechanic seemed connected with those changos. Enough, therefore: 3,000,000 lbs. wrought up, is a mighty yearly work—England is very busy—she will get thin and care-worn if thus she works. So thought some, gazing at those 3,000,000 lbs.; but the numbers would, strange to say, keep growing; the roar of wheels increased not only in the old places, but on the right hand and on the left; from the once quiet streams in gentle valleys the strange perplexing sound perseveringly arose. The traveller who had long left his home in some lonely glen, returned, and saw the river—where he, a boy, had wandered the long day, catching many a stout fish, and scarcely meeting with man—awarming with busy mechanics, and many lights from tall factories flashing upon the stream, where once nought but the lights of heaven played. Truly the 3,000,000 lbs. had grown to 10,000,000; nor did the numbers yet stand still, no rest was seen; and where, indeed, could rest be? for the 3,000,000 rose to 20,000,000, whilst men were gazing and listening with no small wonderment. We need not trace the gradual rise of the numbers. It may be sufficient to state that the 3,000,000 lbs. rose to 280,000,000 lbs. of raw cotton used yearly in the factories of Britain. Such has been the rapid growth of the cotton manufacture, affecting not only England, its central place of growth, but the New and Old World; the former as the field of its first production, the latter as the recipient of the treasured material. The down of a pod has now become of such importance, that jealous and suspicious nations are kept from war by the wants it has created, and by the readiness with which it supplies those wants. A fact full of deep meaning is this, for all who are engaged in studying the great problem of human civilisation.

But the reader may now inquire, whether this manufacture is *wholly* modern; whether the earlier ages of the world remained ignorant of the great uses to which the down of the cotton plant might be applied. To this we answer, that the manufacture existed in the East, especially in Persia and Egypt, at the commencement of the Christian era, but probably on a small scale, for native use only. Neither of those countries appears to have exported the manufactured cotton, otherwise it would certainly have been found amongst the almost numberless luxuries brought to Rome, from the remotest regions of the earth. No mention is made of such a commodity in the Roman lists of articles paying custom dues.

The manufacture has also existed in India from a remote period, as Herodotus, who flourished 450 years before the Christian era, and travelled into Assyria and Babylonia, speaks of garments worn by the Indians, which were made from the *substance of a plant*, much finer than sheep's wool. What could this have been but cotton? No known plant supplies a material answering to such a description except the Gossypium.

Similar testimony is given by another ancient writer, Nearchus, the favourite admiral of Alexander the Great, who is supposed to have surveyed the regions of India lying along the Indus. He mentions garments made from a *white substance growing on trees*. Was not this cotton? He who should answer "yes," would not be accused of rashness.

Cotton was certainly brought from various parts of India into the eastern provinces of the Roman empire,

in the sixth century, all of which circumstances indicated the existence of this manufacture in India. Nor was it unknown to Europe in the middle ages, the Moors of Spain being celebrated for their cotton products about the year 1000, and, 300 years later, Barcelona was distinguished for similar commodities.

A singular illustration of the rising of an art in two distinct and unconnected regions, was given upon the discovery of America, when the cotton manufacture was found amongst the Mexicans and Peruvians, whose priests were clothed in robes made from that substance, which now supplies a healthy and elegant clothing to the millions of Britain. This clearly proves the independent origin of the cotton manufacture in the two most remote regions of the world—India and America.

In England, also, the manufacture was known at least 200 years ago; for we hear Lewis Roberts, in his "Treasury of Traffic," thus speak of the present seat of the iron trade: "In Birmingham cotton wool from the East was worked into fustians and dimitics." There are notices 200 years before this, of *cottons* in England; and it has been supposed that the manufacture existed here in the fifteenth century, for we read that Bolton-le-Moor then excelled in the making of cotton goods. But here a singular circumstance must be noted: the word *cotton* was applied to *woollen* stuffs in the fifteenth and following centuries. When, therefore, we read of the Manchester *cottons* of the sixteenth century, it appears that we must understand *woollens*, the manufacture of which is of ancient date in England. That woollen goods should be described as *cottons*, may seem strange to many readers; but the wonder will vanish if we admit, with some, that the term cotton is but a corruption of the word *coating*, which would, of course, apply to any material suited for clothing.

Such a use of the word was not confined to the ignorant, but sanctioned by the style of acts of Parliament, one of which, in the time of Edward VI., treating of "Manchester, Lancashire, and Cheshire *cottons*," is entitled, an Act "for the true making of *woollen* cloth;" and the material intended was certainly woollen, as appears from various clauses of the statute.

Camden uses similar language when treating of the trade of Manchester, and speaks of "*woollen* cloths, which they call Manchester *cottons*." One remnant of this custom still exists in the term "Kendal cottons," which are coarse *woollen* cloths, chiefly manufactured for the negroes of America and the West Indies.

It must be admitted that the cotton manufacture did not take deep root in England till of late years; the rapid growth has, however, made ample amends for previous slowness. The peculiar advantages possessed by the localities in which the cotton manufacture originated, contributed to its astonishing growth, for in South Lancashire, and the south-western parts of Yorkshire, are the three great elements,—water-power, fuel, and iron,—all of which form the combination requisite for vast manufacturing operations. Thus the river Irwell was so crowded with mills, that nearly 300 were found along the banks of that stream and its branches.

In these busy hives, plain men, of strong sense and persevering character, have created fortunes from which many a principedom might have been formed, whilst from the ever-working factories of the North, the beautiful production of almost countless spindles and one hundred thousand looms have gone to the remotest regions of India, the central districts of Africa, and the western wilds of America. But how has this result been accomplished? Has it been effected by vast combinations of *human labour*?—Did mere hands, bones, and muscles, raise the structure of the cotton-trade? Mere physical application will do much, doubtless,—it raised the Pyramids, founded the glories of Thebes, and spread out over the ancient world the Cyclopean cities in ages too distant to be clearly scanned through the mists of many centuries. But mere labour would never have worked out the results of the system we have been

contemplating; *machinery* has produced the marvel; this has taken up the load which the physical powers of man would have reeled under.

CHAP. V.

THE ROMAN FATHER.

DREAMS, ye strange mysterious visions of the soul! Ye wild and freakish gambolings of the spirit, freed from the incubus of matter, and unfettered by the control of reason, of what fantastic caprices are ye the originators—what caricatures of the various features of our waking life do ye not exhibit to us, ludicrous and distorted indeed, but still preserving through their most extravagant exaggerations, a wayward and grotesque likeness to the realities they shadow forth! And stranger even than your most strange vagaries, is the cool matter-of-fact way in which our sleeping senses calmly accept, and acquiesce in, the medley of impossible absurdities you offer to their notice. We conceive ourselves proceeding along a green lane on horseback; the animal upon which we are mounted becomes suddenly, we know not how, a copper tea-kettle; we ride quietly on without testifying, or even feeling, the least symptom of surprise (as though the identity of hackneys and tea-kettles was a fact generally recognised in natural history); the kettle addresses us, it converses with us on all the subjects which interest us most deeply; and we discuss our various hopes and fears, joys and sorrows, loves and hates, with no other sentiment, save a degree of pleasure at the very sensible and enlightened views which the utensil takes of the matter. I might multiply examples, *ad infinitum*, to illustrate my meaning; but to those who are familiar with the phenomena described, one instance will suffice; while those who have never experienced them, will probably, at all events, take refuge in disbelief, and lament themselves with a self-satisfying sorrow over the fresh proof it affords of the truth of the Israelitish Monarch's aphorism, that "all men are liars."

Be this as it may, my sleep (when, at length, after the excitement I had undergone, sleep condescended to visit me, which was not until, contrary to all the rules of good breeding, the god had allowed me to call upon him repeatedly in vain) was disturbed by all sorts and kinds of visions. Lawlesses innumerable, attended by shoals of top-booted shrimps, the visionary shrimp being a sort of compromise between the boy so called, and the real article,—drove impossible dog-carts drawn by quadrupeds whose heads and necks bore a striking resemblance to the waltz-loving Diana Clapperton, up and down ball-rooms, to the unspeakable terror of squadrons of turbaned old ladies. Deafening peals of bells, rung by troops of Freddy Coleman (which I take to be the correct plural of Coleman) were rousing night-capped nations from their slumbers in alarm, to whom flocks of frightened mayors were bleating forth bewildered orders, which resulted in provoking everybody; and through it all, mixed up and combined with everything, the pale interesting face of Clara Saville, characterised by an expression of sadness, gazed at me reproachfully out of its large trustful eyes, and rendered me intensely miserable. From dreams such as these I was not sorry to be aroused by the sun shining brightly in through my window-shutter; and, on consulting my watch, I found, somewhat to my surprise, that I had slept till nearly mid-day.

On reaching the breakfast-room my first inquiry was for Lawless, in reply to which I was informed, that he had returned (on the fire-engine) about half an hour after I came in; that immediately upon his arrival he had called for unlimited supplies of rum, lemons, and other suitable ingredients, wherewith he manufactured a monster brewing of punch in a washing-tub, for the benefit of the firemen, with whom he had somehow contrived to establish the most amicable relations; he then assisted in discussing the beverage he had prepared, which appeared to produce no particular effects, until, wishing to rise to return thanks when they drank his health, he lost his balance, and being carried to bed by the waiter and boots, had not yet re-appeared. Not liking to disturb him, I breakfasted alone, and then strolled out to look after Freddy. I found him sitting in the study, busily engaged in drawing the lease he had mentioned to us the night before. On seeing me, however, he sprang up, and shaking me by the hand, inquired how I was after all our adventures.

"That's all right, so far," was his reply to my assurance that my injured arm was going on favourably, and that, barring that, I felt no ill effects of any kind. "I tell you what," he continued, "my governor's in no end of a rage about the bell ringing affair: that old fool of a mayor recognised me it seems, and vows vengeance, threatening to do all sorts of things to me, and the governor swears he'll aid and abet him in anything he chooses to do. They had better take care what they are at, or they may find I'm not to be bullied with impunity; but come along into the drawing-room; I don't mind facing the elders now I've got you to support me; and really, what between my father's accusations, and my mother's excuses, it's as good as a play."

"You're abominably ungrateful, master Fred," replied I, as I turned to follow him.

On reaching the drawing-room we found Mr. Coleman standing with his arms folded, and with an air of dignified severity, so exactly in the centre of the hearth-rug, that he seemed to belong to the pattern. Seated in a low arm-chair on his right hand was Mrs. Coleman, apparently absorbed in the manufacture of some mysterious article of knitting, which constantly required propitiating by the repetition of a short arithmetical puzzle, without which it would by no means allow itself to be created. At her feet, engaged in the Sisyphean labour of remedying the effects of "a great fall" in worsteds, scissors, and other "articles for the work-table," knelt Lucy Markham, looking so piquante and pretty, that I could not help wondering how my friend Freddy contrived to keep himself heart-whole, if, as I imagined, he was thrown constantly into her society. The party was completed by a large, sleek, scrupulously white cat, clearly a privileged individual, who sat bolt upright in the chair opposite Mrs. Coleman, regarding the company with an air of intense self-satisfaction, and evidently considering the whole thing got up for her express delectation. Mr. Coleman received me with an air of pompous civility, hoping I felt no ill effects from my exertions in the earlier part of the evening—taking care to lay a marked emphasis on the word earlier. Lucy acknowledged my presence by a smile, and a slight inclination of the head, but without altering her position. Worthy Mrs. Coleman, however, jumped up, and shook hands warmly with me, thereby providing Lucy with full employment for the next ten minutes in picking up the whole machinery of the knitting.

"Very glad indeed to see you, Mr. Lawless," commenced Mrs. Coleman.

"It's Fairleigh, mother," interposed Freddy.

"Yes, my dear, yes, I knew it was Mr. Fairleigh, only I'm always making a mistake about names; but I never forget a face I've once seen; and I'm sure I'm not likely to forget Mr. Fairleigh's after the noble way in which he behaved last night" (here Mr. Coleman turned away with a kind of ironical growl, and began caressing the cat). "I declare when I saw him sitting

Miss Saville's dress on fire, so nicely made as it was too—

"My dear aunt," remonstrated Lucy, "it was Mr. Lawless who threw down the candelabrum, and set Clara's frock alight."

"Yes, my love, I know, I saw it all, my dear; and very kind it was of him, I mean afterwards, in speaking to me of it; he said he was so very sorry about it,—and he called it something funny, poor young man,—'no end of a something or other'—"

"Sell," suggested Freddy.

"Oh yes, that was it, no end of a sell. What did he mean by that, my dear?"

"I strongly disapprove," observed Mr. Coleman (who still continued stroking the cat as he spoke, which process he performed by passing his hand deliberately from her head, along her back, to the very tip of her tail, which he retained each time in his grasp for a moment, ere he recommenced operations), "I highly disapprove of the absurd practice, so common with young men of the present day, of expressing their ideas in that low and incomprehensible dialect, termed 'slang,' which, in my opinion, has neither wit nor refinement to recommend it, and which effectually prevents their acquiring that easy yet dignified mode of expression, which should characterize the conversation of the true gentleman. In my younger days we took Burke for our model; the eloquence of Pitt and Fox gave the tone to society; and during our hours of relaxation, we emulated the polished wit of Sheridan: but it is a symptom of that fearful levelling system which is one of the most alarming features of the present age, instead of striving to raise and exalt—"

"Really, my dear Mr. Coleman, I beg your pardon for interrupting you," cried Mrs. Coleman, "but this is the second time you've lifted my poor little cat off her hind legs by her tail; and though she's as good as gold, and lets you do just what you like to her, it can't be pleasant for her, I'm sure."

"The only reply to this, if reply it can be called, was an angry "Psha!" and, turning on his heel, Mr. Coleman strode with great dignity towards the window, though the effect was considerably marred by his stumbling against an ottoman which stood in the way, and hurting his shin to an extent which entailed rubbing, albeit a sublimary and un-Spartan operation, as a necessary consequence. A pause ensued, which at length became so awkward, that I was about to hazard some wretched commonplace or other, for the sake of breaking the silence, when Mrs. Coleman addressed me with—

"You'll take some luncheon, Mr. Lawless, I'm sure. Freddy, ring the bell!"

"He'll be ready enough to do that," growled Mr. Coleman; "you could not have asked a fitter person."

"Of course he will, a dear fellow," replied Mrs. Coleman; "he's always ready to oblige anybody."

"I disapprove greatly of such extreme facility of disposition," observed Mr. Coleman; "it lays a young man open to every temptation that comes in his way; for want of a proper degree of firmness and self-respect, he gets led into all kinds of follies and excesses."

"Now, my dear Mr. Coleman," returned his wife, "I cannot bear to hear you talk in that way; you are too hard upon poor Freddy and his young friends; I'm certain they meant no harm by it all; if they did ring the bells by way of a joke, I dare say they had drunk rather more champagne than was prudent, and they scarcely knew what they were about; and really all they seem to have done was to make people get up a little sooner than usual, and that is rather a good thing than otherwise, for I'm sure if you did but know the trouble I have sometimes in getting the maids out of bed in a morning,—and that fine lady gentleman of a footman too, he's just as bad.—Why, what's the matter now?"

"I really am astonished at you, Mrs. Coleman,"

exclaimed her husband, walking hurriedly across the room,—although this time he took care to avoid the ottoman, "encouraging that boy of yours in such scandalous and ungentlemanly proceedings as those he was engaged in last night! No harm, indeed! I only hope (that is, I don't hope it at all, for he deserves to be punished, and I wish he may) that the laws of his country may think there's no harm in it. Mr. Dullmug, the mayor, intends, very properly in my opinion, to appeal to those laws; and that is a thing, I am proud to say, no Englishman ever does in vain. You may smile, sir," he continued, detecting Freddy in the act of telegraphing to me his dissent from the last doctrine propounded. "You may ridicule your old father's opinion, but you'll find it no laughing matter to clear yourself, and justify your conduct, in a court of justice. They may bring it in conspiracy, for I dare say you plotted it all beforehand; they may bring it in riot, for there were three of you engaged in it; they may bring it in treason, for you incited his majesty's subjects to commit a breach of the peace, and interfered with the proper officers in the discharge of their duty: 'pon my word I believe they might bring it in murder, for the poor child that had the measles in the town died between six and seven o'clock this morning, and no doubt the confusion had something to do with accelerating its death. So, sir, if you're not hanged, you're certain of transportation; and don't ask me to assist you; I've lived by supporting the law for fifty years, and I'm not going in my old age to lend my countenance to those who break it, and set it at naught, though my own son be one of them. I have spoken my mind plainly, Mr. Fairleigh, more so perhaps than I should have done before a guest in my own house, but it is a matter upon which I feel deeply. I wish you good morning, sir." So saying, he turned away, and stalked majestically out of the room, closely followed, not to say imitated, by the cat, who held her tail erect, so as to form a right angle with the line of her back, and walked with an air of meek dignity and chastened self-approval.

"That's what I call pleasant and satisfactory," exclaimed Freddy, after a pause, during which each member of the party exchanged glances of consternation with somebody else. "Who would ever have imagined the possibility of the governor's turning cantankerous—assuming the character of the Roman father upon the shortest possible notice, and thirsting to sacrifice his son on the altar of the outraged laws of his country! What an interesting victim I shall make to be sure! Lucy must lend me that wreath of flowers she looked so pretty in last night, to wear at the fatal ceremony. And my dear mother shall stand near, tearing out those revered locks of hers by handfuls." (The reader should perhaps be informed that Mrs. Coleman rejoiced in a false front of so open and ingenuous a nature, that from its youth upwards it never could have been guilty of deceiving any one.) "May I ring and tell John to have all the carving-knives sharpened? it would be more satisfactory to my feelings not to be slaughtered with a blunt weapon."

"Don't talk in that horrid way, Frederic," cried Mrs. Coleman, "I'm sure your father would never think of doing such dreadful things; but I believe you're only making fun of him, which isn't at all right of you. I'm not a bit surprised at his being angry with you, when you know how steady he always says he was as a young man (not that I ever quite believed it though); he never went ringing bells, however late he might stay out at night, that I heard of (though I should never have known it if he had, very likely). I don't myself see any great harm in it, you know, Mr. Fairleigh, particularly after your saving poor Clara Saville, and Freddy from drowning,—indeed I shall always have the highest opinion of you for it, only I wish you had never done it at all, either of you, because of making your father so angry, you I mean, Frederic."

"Have you received any account of Miss Saville this morning?" inquired I, anxious to change the conversation; for I could see that Freddy, despite his assumed indifference, was a good deal annoyed at the serious light in which the old gentleman seemed to look upon our escapade. "I should be glad to know that she was none the worse for all the alarm she must have suffered."

"No, we have not heard anything of her," replied Lucy. "Should we not send to inquire after her, aunt?"

"Certainly, my dear Lucy; I am glad you have reminded me; I always meant to send, only all this has put it out of my head."

"Now, Frank, there's a splendid chance for you," exclaimed Freddy; "nothing can be more correct than for you to call and make the proper inquiries in person; and then if old Stiff-back should happen not to be at home, and you can contrive to get let in, and the young lady be not actually a stone—"

"Indeed, Frederic, she is nothing of the kind," interrupted Lucy, warmly; "if you only knew her, you would be astonished to find what deep and lively feelings are concealed beneath that calm manner of hers; but she has wonderful self-control. I could see last night how much she was grieved at being obliged to go away without having thanked Mr. Fairleigh for saving her."

"Give her a chance to repair the error to-day, by all means, then," said Freddy; "and if you should succeed in gaining an interview, and she really is anxious to do a little bit of the grateful, and old Vernon does not kick you down stairs, I shall begin to regret that I didn't extinguish her myself."

"I really have a great mind to follow your advice," returned I; "it is only proper to inquire after the young lady, and they need not let me in unless they like."

"If you should see her, Mr. Lawtegh," said Mrs. Coleman, "tell her from me, how very much vexed I was about the candelabrum being thrown down and setting fire to her dress; it was made of the very best Dresden China, and must have cost (only it was a present, which made it all the more valuable you know) fifteen or sixteen guineas; and I'm sure I wonder, now I come to think of it, why it did not blaze up and burn her to death; but you were so quick and clever, and entirely spoilt that beautiful whittle of old Mrs. Trotties, with the greatest presence of mind; and I'm sure we ought all to be thankful to you for it; and we shall be delighted to see her when she has quite recovered it, tell her, particularly Lucy, who is nearest her own age, you know."

"Let me see," said Freddy, musing; "Mrs. Trotties must be seventy-two if she is a day; 'pon my word, Lucy, you're the youngest-looking woman of your age I ever met with; if I had not heard my mother say it myself, I'd never have believed it."

"Believed what, Freddy? What have I said?" asked Mrs. Coleman.

"That Lucy was Mrs. Trotties' most intimate friend, because she was nearest her own age," returned Freddy.

"No such thing, sir; I said, or I meant to say,—only you are so tiresome with your jokes, that you puzzle one,—that [Lucy being her own age, I mean Clara's, Mr. Fairleigh was to tell her how very glad she would be (and very natural it is for young people to like young people) to see her; and I hope you'll remember to tell her all I have said, Mr. Fairless, for I'm always anxious to try to please and amuse her, she's so very dull and stupid, poor thing!"

To perform this utter impossibility I faithfully pledged myself; and taking a hasty farewell of the ladies, hurried out of the room to conceal a fit of laughter, which had been gradually becoming irrepressible.

"Laugh away, old boy," cried Freddy, who had

accompanied me into the hall; "no wonder I'm an odd fellow, for, as Pat would say, my mother was one before me, and no mistake. I wish you luck with the fair Clara,—not that you'll see her,—old Vernon will take care of that somehow or other; even if he's not at home, he'll have locked her up safely before he went out, depend upon it."

"You do not mean that in sober earnest?" said I.

"Perhaps not actually in fact," replied Freddy, "but in effect I believe he does. Clara tells Lucy she never sees any one."

"She shall see me to-day, if I can possibly contrive it," said I. "Oh, for the good old days of chivalry, when knocking the guardian on the head, and running away with the imprisoned damsel afterwards, would have been accounted a very moral and gentlemanlike way of spending the morning!"

"Certainly, they had a pleasant knack of simplifying matters, those 'knights of old,'" replied Freddy; "but it's not a line of business that would have suited me at all; in balancing their accounts, the kicks always appear to have obtained a very uncomfortable preponderance over the halfpence; besides, when one kills a man, it's as well to have some slight notion *why* one does it; and the case comes home to one still more closely, if it's somebody else who's going to kill you."

"You're about right there, master Freddy," said I, smiling as I shook hands with him, and quitted the house.

A CHRISTMAS PARTY IN THE COUNTRY.

CHAP. VII.

MISS CAMPBELL had not much difficulty in unravelling the mystery of Agnes's charade; and Justine then asked why the *Helleborus niger* is called a rose, since it has little resemblance to that flower.

"It certainly does not resemble the various double roses of our gardens," replied Sophia; "yet it is not unlike in shape to the common hedge-roses, which botanists regard as the original stock whence all those delightful varieties have sprung; and old Gerarde describes it as bearing 'rose-fashioned flowers,' which is more correct than what he says of its slender stalk, for that is, as you see, like the leaves, thick and succulent, and very unlike the 'twisted Eglantine.'"

"There have been learned disputes," said Mr. Barlow, "as to whether Milton meant the wild-rose or the honeysuckle by that expression; I see, Sophia, you incline to the opinion which assigns it to the rose. I always consider the slight, delicate, rambling hedge-rose as the Eglantine, seeing I have my friend Gerarde's authority for doing so, and that the Honeysuckle or Woodbine has names sufficiently poetical without usurping this; and, though I know some say our great poet would not be guilty of the tautology of putting another rose into his picture after the sweet-briar, yet I beg to state that they are distinct varieties, and differ in their habit of growing; and, if he had meant the honeysuckle, he might have been more correct, and found an equally good rhyme, in the more generally applied name of Woodbine."

"I should be inclined to agree with Sophia," said Miss Campbell, "if the hedge-rose were 'twisted,' but, alas! it is not, and the honeysuckle is. However, I beg to retract what I said of the heather, dear as it is, being our only floral beauty in Scotland, since we have wild-roses, and none is more beautiful than the white Ayrshire, whose delicate flowers contrast so gracefully with its rich brown stems and dark leaves."

"As you advance so rapidly under my tuition in German, Lucy," said Frederic, "you ought to know that this flower is called in that language *Christwurz*, or Heilich Christkrant, for the same reason that it is

called Christmas-rose here, I suppose, if that is from its season of flowering."

"I am induced," said Mr. Forster, "to think, that the word 'rose,' when applied to other flowers, is used more as an honorary title than as a descriptive appellation; and that this mode of applying it is derived from the eastern idiom, whence so many more of our daily phrases and ideas are derived, than those who are not in the habit of studying the subject would imagine. The word 'rose' occurs but twice in the Bible; and in one of those places, the seventy learned men who translated the Septuagint have rendered it 'Flower of the field,' instead of 'Rose of Sharon,' which is the more generally received version. The same word, in Persian, 'gul,' signifies both rose and flower; and I believe Cyril will tell us that one word has both meanings in Arabic; so that Christmas-rose may not so much indicate a rose-like flower, as the Christmas-flower *par excellence*—the flower which stands unrivalled at Christmas—as the rose does in that season when so many vainly strive with her for the pre-eminence."

"I remember, my dear father," said Alice Forster, "that you tried hard to trace to the same eastern source the monkish legend carved in the magnificent Chapter-house of York Minster, which you pointed out to me when we were there."

"Oh!" cried Charles, "I recollect that boast—

'Ut Rosa flos florum, sic est dominus ista donorum;'

which I suppose I may be allowed to translate, for the benefit of little Laura: 'As the rose is the chief of flowers, so is this house the chief of houses.'

"More than Laura are obliged you, Mr Charles," said Miss Campbell; "but pray, Alice, will not these observations apply to your favourite primrose, whose name you heard censured so much to your amusement by somebody, who said they could not see why it was called a *prime* rose, since for their parts they did not think it was a rose at all, and if it was, it was a very shabby one?"

"Poor old lady, she was quite right: for it has not the slightest resemblance or relationship to a rose, but takes its name from the Latin word 'primus,' first—the first flower of the spring; the word 'rose' here again meaning flower, and agreeing with my father's theory. Is it not so, Sophia?"

"Yes; and its botanical name, *Primula*, has the same derivation."

"And is it not called *Primvère*, in French, Justine?" asked Agnes; "and that has very much the same sound."

"It is so," replied her cousin; "and I dare say it has the same meaning."

"Yes," continued Sophia; "the French *Primvère*, the Italian *Primavera*, and the Spanish *Prima veris*, all signify the first of the spring: indeed, in Italian, *Primavera* stands for spring itself; and the primrose, with its name at full length, is *Fior di primavera*—so, you see, the general voice of Europe pronounces Alice's pet the first flower of the year."

"O Primavera," quoted Cyril—

'O Primavera, gioventù dell' anno,
Bella madre di fiori,
D'erbe novelle e di novelli amori;
Tu torni ben, ma teo
Non tornano i sereni
E fortunati di delle mie gioie.'

"In spite of Cyril's sentimental Italian quotation," said Rosaline, "I will venture to give you one in plain English, from the peasant poet, John Clare, who has described the primrose very beautifully in one of his sonnets:—

'Welcome, pale Primrose! starting up between
Dead matted leaves of ash and oak, that strew
The every lawn, the wood, and spinny through,
Mid creeping moss and ivy's darker green:

How much thy presence beautifies the ground!—

How sweet thy modest unaffected pride
Glow on the sunny bank and wood's warm side!
And, where thy fairy flowers in groups are found,
The schoolboy roams delightedly along,

Plucking the fairest with a rude delight:
While the meek shepherd stops his simple song,
'To gaze a moment on the pleasing sight;
O'erjoyed to see the flowers that truly bring
The welcome news of sweet returning Spring.'

"Does it not describe what we have all seen very, very often?"

"I must put in my word again," said Frederic, "for a little more attention to Lucy and myself: Sophia is very affronting to us; for, when talking of the general voice of Europe, she did not choose to notice Germany, where the primrose is not only called by the learned, *der Primel*, from the Latin, *Primula*; but by the peasantry, *Schlupelblume*."

"And pray, cousin Frederic, what is the meaning of that very ugly word?"

"Why, Agnes, it means Key-flower, and I think it very appropriate."

"Well done, Frederic," cried Charles; "even Neville the Grave looks up from his book in wonder, as to how you will prove your assertion."

"Neville the Grave must allow that you are all very ignorant of the deeply mystical and poetical spirit of the German language, or you would see at once that the primrose, as a key, unlocks the gates of spring, and opens the way to the blooming train of Flora. I am sure Rosaline will be able to find, in some corner of her memory, a quotation to suit with this idea."

Rosaline murmured over Milton's "Now the bright morning star, day's harbinger," and Gray's "Lo! where the rosy-bosomed hours, fair Venus' train appear,"—but soon shook her head in despair, and her father complimented Frederic on having got pretty well over his difficulty. "Though I think," added he, "there is not a little mist, as well as mystical poetry, in your explanation: I had thought the cowslip was the flower meant by '*schlupelblume*.'"

"The cowslip is one of the primrose tribe," said Lucy; "and the varieties of this tribe—the cowslip, oxlip, polyanthus, auricula, &c.—are all so very nearly alike, that they are often confounded one with the other by old writers. I half fancy the cowslip still more rural than the primrose, and I think aunt Martha will agree with me, since she is always delighted to receive the very first which is found in the meadows."

"Indeed I am, Lucy; and I quite agree with you, that the cowslip is more rural than the rest of the tribe. Is it not the chosen of all the village children? One of the first pleasures of the spring is to see the little creatures wandering into the fields, rushing upon the flowers as upon a newly discovered treasure,—loitering homewards laden with them,—their hands, their hats, and their pinafores full; and then sitting down in a circle under the sunny hedgerows, and making up their spoils into huge round cowslip-balls, as round, though not so rosy, as their own merry faces. What can be so rural as a cowslip-ball?—Nothing but a May garland, and that is often half-composed of cowslips."

"I dare hardly combat with Mrs. Martha's enthusiasm," said Alice; "yet I would still venture a word for my poor primrose, which is very, very lovely, nestling under some bank as if listening to the murmur of the running stream below, or looking up with its quiet eyes from the shady woodside, as if each flower were a banished star, and pale with pining for its native skies. Do they not spring up sometimes in the mild May mornings, as if the bright silvery orbs we had looked on the night before had grown tired of shining, and dropped down into the green sward to rest, and the sweet blue hyacinths bend over them as if they were singing and soothing the weary strangers to sleep?"

"Alice, Alice," said her sister Charlotte, "you let your fancy run away with you strangely. I must give my vote with Mrs. Martha and Lucy, not on their grounds but on that of usefulness, for all the primroses in the woods would never cure the coughs and colds of the village as cowslip-wine does."

"There speaks the good housewife, Charlotte," said Mr. Loraine, "and I am quite willing to give my testimony in favour of your bright and beautiful cowslip-wine, though my good lady fancies it has a rival in her rich elder-syrup. You certainly doctor the village between you. Even Miss Campbell must let her national heather hang its diminished head when brought into competition with so much usefulness."

"Wae's me for the poor heather!" said Margaret, "it has indeed lost the fame it formerly possessed: but I would have you to know that it is recorded by our historian, Boethius, as very nutritive to birds, beasts, and specially to bees; and that of this flower the Picts made a delicious and wholesome liquor: but the manner of making it perished with their extermination, as they never showed the craft except to their own blood."

"Well, well, you have said more for it than I expected."

"Yet not all that may be said," continued Miss Campbell, "or at least not so well as it has been said by our Scottish poet Leyden -

'Sweet, modest flower, in lonely deserts dun,
Retiring still for converse with the sun,
Whose sweets invite the soaring lark to stoop,
And from thy cells the homed dew-bells scoop!
Though unobtrusive all thy beauties shine,
Yet boast thou rival of the purpling vine!
For once thy mantling juice was seen to laugh
In pearly cups, which monarchs loved to quaff;
And frequent awoke the wild inspired lay,
On Teviot's hills, beneath the Pictish sway.'

"Here," said Sophia, "is a drawing of a pretty little flower, which, though not common in general, is so in this neighbourhood, and shows the close affinity of the primrose and the auricula. It is the Bird's-eye-primrose, or *Primula farinosa*, and, though I have not succeeded very well, you may see by this drawing that both flower and leaf are covered with a sort of white farina or powder, from whence it derives its name."

"Pray, is the Evening primrose of our gardens a native British plant?" asked Margaret, "and what right has it to the name of primrose, for it is a summer flower, and does not appear before June?"

"The *Oenothera biennis* or evening primrose is a native of North America; yet it is to be found wild on the sea-shore in Lancashire, where it is supposed the seeds have been wafted by the waves of the Atlantic," said Sophia. "It has its name from some resemblance which it bears both in shape and colour to the common primrose, but the resemblance goes no farther, for it belongs to a very different tribe of plants. The botanical name comes from the Greek, and signifies 'seeking or hunting wine,' the roots of this plant being formerly eaten like olives, as a provocative to drinking—a fashion which we may hope the progress of temperance will soon number amongst those by gone customs 'more honoured in the breach than the observance.'"

"The plant, however," said Lucy, "has better claim on our notice than this bad quality. It is remarkable for not unfolding its blossoms until the sun is declining, and is compared by Professor Lindley to the owl, though he acknowledges the comparison does it injustice. Its mode of opening, too, is very curious. The petals are held together at the top by hooks which grow from the end of the calyx or outward covering, and it first begins to expand at the bottom of the cup, and is a long time before it acquires force enough to disengage itself at the top, when it bursts open almost instantaneously, and the corolla spreads out nearly flat, becoming flaccid, and closing again the following morning."

"There are no wild plants of this species in any other part of England but Lancashire," continued Sophia: "but we have one which greatly resembles it, and is of the same tribe; that is the *Epilobium*, which name is descriptive of the flower seated on a pod. In English it is called willow-herb, and, I dare say, Agnes and Laura will know it by a still more rustic name, if they look at this drawing of its gay pink flowers."

"Oh, yes!" cried Laura Barlow, "we always call it codlings and cream at Woodthorpe, and, I think, Alice calls it apple-pie, it smells so nice, just like baked apples."

"Thank you, Laura, both for the names and derivation, since those names are decidedly derived from the peculiar smell of which you speak."

"Cyril," asked Mrs. Loraine, "can you confirm the report which Professor Lindley gives of the beauty of the primrose tribe in India, where, he says, it glows in the richest shades of purple or crimson, and spreads in profusion around the Himalayan mountains?"

"I am not botanist enough to speak of them as a tribe when dressed so very differently from our English flower; but your discourse of roses reminds me of our beautiful Oleanders, which we also call bay-rose, or laurel rose. They do greatly resemble roses, and are as lovely and graceful in hue, and as sweet in perfume. We have also another rose, which is, however, rather less rose-like—the *Rosa Sinensis* or Japan rose as you call it here; though its Indian name is always *Hibiscus*. I think I must place it in competition with Charlotte Forster's cowslip, and Miss Campbell's heather, since it is equally useful and ornamental."

"The *hibiscus* useful!" exclaimed Justine, "I know it well, having seen it both in the splendid conservatories near London, and on the magnificent Chinese paper with which the salon of *Hôtel du Vénus* is hung. O that room is so beautiful! the flowers and birds of every strange form and variety reflected in all the mirrors and contrasted with the rich and heavy drapery of silk damask! One might almost fancy it one of the scenes of the thousand and one tales! But I never before heard that the *hibiscus* was useful."

"My good cousin, it would be useful if only as a pattern for such a beautiful design as the paper you speak of; but we find it useful in India to make a sort of jelly, which greatly resembles currant jelly in flavour and colour, and is used instead of that home article, since we have no currants there. The pleasant acid petals are what are employed, and their bright colour is not lost in the process, so that I have no doubt, Miss Campbell, but our *hibiscus* jelly is equal to your lost heather wine."

"You are all in the wrong, Cyril," interrupted Alleyne, "if you think *hibiscus* is a native Indian word, for it is Greek—Greek for some sort of mallow."

"Yes," said Sophia, "it certainly is, and is applied by modern botanists to this flower, as one of the mallow-tribe. Brilliant as it is, if you examine the structure of the flower you will find it resemble that of our native mallows, which are, however, low-growing herbaceous plants, whilst the *hibiscus* is a shrub. I never heard before of the Japan rose being made into jelly; but I know that the Chinese make use of it to black their shoes, and that one of the species is sometimes put into soups and curries for the sake of the pleasant acid flavour it gives to them. Some of our English mallows are very pretty, particularly the *Malva moschata*, or musk mallow, whose pale pink flowers, and the musk-like scent from which it derives its name, might well entitle it to a place in our gardens, if it were not to be found in profusion by the way side. Can any thing be more fragile than its texture, or more delicate than its odour as the wind gently waves its blossoms, surrounded as they are by bright leaves, divided into innumerable small lobes? Nor is the tribe here without its useful members. The *Althea officinalis*, or marsh mallow, has its botanical name from the Greek word, 'to cure,' and

is well known as an emollient medicine; and under the French name of Guimauve, I doubt not, Justine may have seen it used as a poultice."

"Mamma," interrupted Agnes, "amongst all our roses we have not yet thought of the Rose of Jericho, that very curious flower which you said, one day, was very unlike a rose, though the writer of those lines in your extract book had certainly thought it was a real rose."

"The writer of those lines, Agnes," replied her mother, "was certainly no botanist, and had not the advantage of Mr. Forster's explanation of the manner in which the word 'rose' may be applied. The *Anastatica Hierochuntia*, or Rose of Jericho, is a small cruciferous plant, that is, it has four petals placed cross-wise, in the same manner as those of the wallflower; and it is the subject of a curious superstition on which the lines in question are grounded. Indeed, I know few plants which are more likely to give rise to superstition than this; and, as a native of the East, whence all wonderful things were looked for,—a plant of the desert, and of the Holy Land,—it is not surprising that its marvellous properties should have been thus magnified by the early travellers and pilgrims into the power of predicting future events."

"Superstition apart, my dear mother," said Sophia, "it is truly a most wonderful and curious plant. Growing in the waste and sandy deserts, the flower becomes shrivelled and dried up on attaining maturity, the petals shrinking and closing around the seeds, which require moisture to enable them to germinate. In this state they are blown about by the winds, and, when the rainy season has refreshed the deserts, some of these wanderers are lodged in the temporary pools which are formed, and there expand again under the invigorating influence of the water, and live a second life until the seeds are sown. In their dried state they may be kept many years, and still will revive if placed in water, from which strange property it has derived its botanical name, of Greek origin, the word *Anastatica* signifying 'resurrection.' It is celebrated amongst Europeans as the Rose of Jericho, and is supposed, by expanding on the birth of a child, to predict its future fortunes. In Egypt, and its native countries, its name is *Kaf Maryam*, or Mary's hand, which seems also a name of superstitious origin."

"What are the lines to which Agnes alludes?" asked Mrs. Barlow. "If not too long, I fancy we should like to hear them."

"If they would not preclude Mr. Hamilton's promised charade, I will join in Mrs. Barlow's petition," said Miss Campbell.

"And I shall put in a few words in favour of a little music, also," said Cyril. "My sisters have promised me a treat from you, Miss Campbell; and I know Charlotte and Alice have been practising 'As it fell upon a day,' ever since the snow began to fall. I am longing to hear all my old favourites; and they pretended they had forgotten that, as if Shakspeare could ever go out of fashion. I hope to-night to hear both that and 'I know a bank whereon the wild thyme blows,' which, by the by, Miss Sophia, you might have brought as a witness against Milton, in your defence of the right of the hedge rose to the name of *Eglantine*.—

'I know a bank whereon the wild thyme blows,
Where ox-lip and the nodding violet grows,
Overcanopied with hush-woodbine,
With sweet musk-roses, and with eglantine.'

"There, I think, it is placed in marked distinction to the woodbine, and linked with the musk-rose, which is distinguished by its proper name."

"We will try to sing it for you, as a reward for coming to Sophia's aid," said Alice. "Was there ever a poet like Shakspeare in his love of flowers, which are strewn about his works in a sweet profusion, which imitates nature's own bounty. But are we not to have your extract-book, Mrs. Lorraine?"

"I believe there will be time to satisfy the claims of all the party," said Mrs. Lorraine; "so run, Agnes, for the book, and Alleyn shall once more be our reader." On Agnes' return, Alleyn read the following lines:—

"Say, dear Serena, for thou now can'st feel
The varied charms which to such scenes belong,
Why nature, doubly bounteous, where she piles
Her highest rocks, her wildest cataract flings,
And winds, 'mid deepest solitudes, her streams,
Then throws o'er all another witching charm,
And bids her children in these regions glow
With deep poetic feeling, till they bind
Pale superstition's brow with flowery wreaths,
And, awe-struck, listen to her deep-toned voice,
Making wild music to their raptured ear?
Feelings like these have surely filled thy mind
As gazing late on Mona's druid isle,
Or climbing cloud-capt Snowdon's steep ascent;
Whilst we, the dwellers of the humbler plains,
Catch but the distant echo of such strains,
And treasure up their memory like dreams
Of some bright world we never may behold.

"And dream-like came of late such tale to me—
And such I now repeat. 'Tis of that land
Whose rocks have cradled liberty; whose hills
Guard her like fortress walls; and whose deep streams
Ran at their foot like the deep trench that guards
Such walls from every hostile foe's attack.
'Tis of Helvetia, where, in a deep vale,
Once dwelt a peasant, lord but of a hut
Which sheltered his declining years: no lore
Was his, but such as age bestows, and such
As long communing with great nature's works
Bring hallowed on the venerable seer
From every misty wreath that wraps the head
Of great St. Gothard, where he loved to trace
Each sign of coming storm, or threatened ill.
Oft to his cot the neighbouring peasant hies
To seek his sage advice; but on one eve,
One solemn eve, each dweller of the vale
Came, anxious each to learn his coming fate.
All round the rustic board in silence sate,
And scarcely breathed, as the grey-headed man
Unlocked his sacred treasure, and produced
A rose—a withered rose—not such as bloom
In the bright valleys of their fatherland,
Shaming the blushes of the maids they love,
Or twining in their smoothly braided hair.
No! this was brought from the far land of morn;
From that blest spot which once the Saviour trod,
And plucked by pilgrim-hands from off His tomb.

"In purest limpid water from the spring
Was placed, with many a rite, the mystic flower;
And, as the awe-struck group with wonder gazed,
They saw each shrivelled petal slowly spread,
Bloom, and expand in renovated youth,
And shed unwonted fragrance all around.
Then burst the shout of joy! Awhile suspense
Had hung on each delay: and threatened ill
Seemed presaged to o'ercloud the coming year:
But when the wished-for omen fully bloomed,
And peace and love foretold for future hours,
Back to the caverns shrunk each anxious care,
And the poor hut 'neath hope's bright radiance smiled!

"I know not if 'mid Cambria's vales there dwell
Tradition of such rite; but sure, my friend,
If such a flower were mine, 'twere offering meet
For this thy natal day. Oh! it should bloom
Amid thy happy circle, and should shed
A fragrance powerful as the love which now
Implores a blessing on the coming year.

"And is there no such flower? There is! there is!
And it is surely thine! since last this day
Called for my wonted tribute, I beheld
It hallowed at the shrine, the holy shrine,
Where, as thou knelt and pledged thy whole pure heart
To him who pledged again his heart to thee,
I knelt beside, and poured a fervent prayer
For blessing on that hour.

"Domestic love is sure a hallowed rose,
And long, Serena, may it bloom for thee,—
For thee, and for the partner of thy heart,
The soother of thy sorrows, which, so shared,
Form but an item in the sum of bliss.
Long may each natal day behold it spread,
Bloom, and expand in renovated youth;
And, influencing each moment of thy life,
Shed over thee a fragrant divine."

"The lines are much indebted to Alleyn's excellent reading," said Mrs. Barlow. "There are few accomplishments which I covet more for my little girl than that of reading well. It is the accomplishment of a gentleman or gentlewoman; and not only a sign of a good education, but of a clear and comprehensive mind, since no one can render an author perfectly intelligible to others, who does not himself understand the meaning of what he reads. Alleyn, I wish you would give Laura a few lessons."

"There, Mrs. Barlow," cried Charles, interrupting his brother's reply; "there, you hear he will be proud and happy, and so forth; but I will begin the instruction by giving her a rule, which I have in vain endeavoured to instil into that giddy girl, Aggy—

'Learn to read slow, all other graces
Will follow in their proper places.'

"Charles, Charles," pleaded Agnes, "let me ask mamma if those lines were not sent to a friend of hers on her birth-day? Cousin Frederic, do you ever write verses?"

"I have never tried to do so since I was at school," replied Frederic; "but why do you ask?"

"Because—because—I should so much like you to write some for me on my birth-day, which will be next week. Mamma, may I not ask all to come again on my birth-day? Mr. Forster, will you not promise to come?"

"But we must not put off the promised music till your birth-day, Agnes," said Cyril.

"Nor the promised charade either," said Margaret.

"Well, precedence must be given to the ladies. One charade, and then—so let me choose a short one. My mother gives me this—

'My First steals on us with a sober pace,
Enriching nature's beauties ere they fade
With brighter glory and with lengthening shade,
Till night's dark pencil doth the scene deface;
Then shrinks my Second with a timid grace
And pallid hue, like to some love-sick maid,
'Neath her broad leaves, nor baleful dews invade
Th' umbrageous covert of her hiding place;
Then, when the robin chaunts his vesper hymn,
And one by one the stars peep through the sky,
My Whole unfolds her golden chalice brim,
Which shunned the lustre of day's garish eye,
As spirits, whom affliction's tears bedim,
Turn from the world to place their hopes on high.'

When the charade had been guessed, Cyril's wishes were at length gratified; and much delightful music followed until the party separated, with the hope of enjoying a similar treat on Agnes' birth-day.

HOCHELAGA.

This is the rather affected name of a very agreeable book of travels in Canada and the United States. Hochelaga was the Indian name of the spot on which Montreal is now built, and is applied by the author, with somewhat questionable propriety, to the whole country of Canada.—

These travels indicate much power of observation, a refined and cultivated mind, liberal and moderate views of subjects of social and political interest, with a cheerful and enlightened tone of religious feeling; and they

constitute altogether one of the most readable works on America which has lately appeared.

We select a few specimens of the author's manner. The following is a reflection at sea:

"That night was unusually mild and clear; and the young clergyman and I remained on deck long after the others had gone below; our talk was grave, but cheerful. There is something in the view of the material heavens at such a time, which always elevates the tone of feeling, and speaks to the heart of its highest hopes, sending you to rest with holy, happy thoughts; so it was with us. A few minutes before we parted, the bright full moon passed from behind a cloud, and straightway, from us to the far-off horizon, spread a track of pure and tremulous light over the calm sea. 'This is not for us alone,' said my companion; 'every waking wanderer over the great deep sees this path of glory too. So, for each earnest heart upraised to heaven, a light from God himself beams upon the narrow way across the waste of life.'"

The following account of the death of Wolfe will be read with much interest:—

"For a few years, and for a great purpose, England was given one of those men whose names light up the page of history. He was humble and gentle as a child, graceful in person and manners, and, raised by transcendent merit in early manhood, he did high service at Mindon and Louisbourg. The purpose was accomplished, and the gift resumed at Quebec, when he was thirty-five years old. This was Wolfe; to him the expedition was entrusted. He took possession of the Island of Orleans, and occupied Point Levy with a detachment. His prospects were not encouraging: the great stronghold frowned down on him from an almost inaccessible position, bristling with guns, defended by a superior force from a gallant army, and inhabited by a hostile population. Above the city, steep banks rendered landing almost impossible; below, the country, for eight miles, was embarrassed by two rivers, many redoubts, and the watchful Indians. A part of the fleet lay above the town, the remainder in the North Channel, between the Island of Orleans and Montmorenci; each ebb-tide floated down fire-ships, but the sailors towed them ashore, and they were harmless.

"The plan which first suggested itself was, to attack by the side of Montmorenci, but the brave Montcalm was prepared to meet it. On the 31st of July, a division of grenadiers landed below the falls; some of the boats grounded on a shoal, and caused great confusion, so that arrangements, excellent in themselves, were in their result disastrous. These men, with an indiscreet ardour, advanced, unformed and unsupported, against the intrenchments. A steady and valiant defence drove them back; a storm threatened, and the loss was heavy, so the general re-embarked the troops with quiet regularity. The soldiers drooped under their reverse, but there was always one cheerful face, that of their leader. Inward care and labour wasted his weak frame; he wrote to England sadly and despondingly, for the future was very dark; but he acted on an inspiration. Though his generals were brave men, they started at his plans; he stood alone in his own bold counsel, risked the great venture, and won.

"On the night of the 12th of September, the fleet approached the shore below the town, as if to force a landing. The troops embarked at one in the morning, and ascended the river for three leagues, when they got into boats, and floated noiselessly down the stream, passing the sentries unobserved. Where they landed, a steep, narrow path wound up the side of the cliff forming the river's bank; it was defended bravely against them, but in vain. When the sun rose, the army stood upon the plains of Abraham.

"Montcalm found he was worsted as a general, but it was still left to him to fight as a soldier; his order of

battle was promptly and skilfully made. The regular troops were his left, resting on the bank over the river; the gallant Canadian seignours, with their provincials, and supported by two regiments, his right. Beyond them, crowding the English left, were clouds of French and Indian skirmishers.

"General Townshend met these with six regiments; the Louisbourg grenadiers formed the front of battle, to the right, resting on the cliff; and there was Wolfe, exhorting them to be steady, and to reserve their discharge. The French attacked at forty paces; they staggered under the fire, but repaid it well: at length they slowly gave ground. As they fell back, the bayonet and the claymore of the Highlanders broke their ranks, and drove them with great carnage into the town.

"At the first, Wolfe had been wounded in the wrist, another shot struck him in the body; but he dissembled his suffering, for his duty was not yet done. Again a ball passed through his breast, and he sank. When they raised him from the ground, he tried with his faint hand to clear the death-mist from his eyes; he could not see how the battle went, but the voice which fell upon his dying ear told him he was immortal. There is a small monument on the place of his death, with the date, and this inscription:—'Here died Wolfe, victorious. He was too precious to be left, even on the field of his glory. England, jealous of his ashes, laid them with his fathers' in the town where he was born. The chivalrous Montcalm was also slain in a lofty situation on Cape Diamond. A pillar is erected to the memory of two illustrious men, Wolfe and Montcalm.'

"Five days after the battle, Quebec surrendered, on such terms as generous victors give to gallant foes. The news of these events reached home but forty-eight hours later than the first discouraging despatch, and spread universal joy for the great gain, and sorrow for its price. Throughout all broad England were illuminations and songs of triumph, except in one country village, for there Wolfe's widowed mother mourned her only child."

A singular illustration of the superstition of the Canadians is here given:—

"The people are wonderfully simple and credulous. A few years ago, at a country town, an exhibition of the identical serpent which tempted Eve, raised no small contribution towards building a church, thus rather turning the tables on the mischievous reptile."

Winter markets at Quebec:—

"The winter markets at Quebec are very curious; everything is frozen. Large pigs, with the peculiarly bare appearance which that animal presents when singed, stand in their natural position on their rigid limbs, or upright in corners, killed, perhaps, months before. Frozen masses of beef, sheep, deer, fowls, cod, haddock, and eels, long and stiff, like walking sticks, abound in the stalls. The farmers have a great advantage in this country, in being able to fatten their stock during the abundance of the summer; and, by killing them at the first cold weather, keeping them frozen, to be disposed of at their pleasure during the winter. Milk is kept in the same manner, and sold by the pound, looking like lumps of white ice."

We conclude with a very striking description of the ceremony of taking the veil:—

"The second now comes forward; she is on her knees, her face uncovered. How white it is! white as the new-fallen snow outside. She is young, has seen, perhaps, some one-and-twenty years, but they have treated her very roughly: where the seeds of woe were sown, the harvest of despair is plentiful—stamped on every feature. And the voice—I never can forget that voice—there was no faltering; it was high and clear as the sound of a silver bell; but oh, how desolate—as it spoke the farewell to the world! It is over—the symbol of

her sacrifice covers her; she sinks down; there seems but a heap of dark drapery on the ground, but it quivers convulsively. The peeling organ, and the chorus of cold, sad voices, drown the sobs, but under the black shroud there throbs the human heart, as if, that heart would break. After the Te Deum has been sung, the Bishop delivers an address, in an earnest and eloquent manner, summing up the duties the veil imposes, and praying for Heaven's holiest blessing upon this day's offering. The two devoted ones rise, walk slowly to the first nun, make a lowly obeisance, then kiss her forehead, and so on with all in succession; each, as she receives the new-comer's greeting, saying:—'Welcome, sister.' Then, by the same door by which they had entered, they go out two and two, the youngest last, and we see them no more.

"Farewell, sister!"

"I have since been told the supposed cause of the last of these two novices taking the veil: though it is but a common-place story, it is not without interest to me, who saw her face that day. Her father was a merchant of English descent. Her mother, a French Canadian, had died many years previously, leaving her and two younger daughters, who were brought up in the Roman Catholic religion. She devoted all her time and interest to give her little sisters whatever of accomplishments and education she had herself been able to attain. Her face was very pleasing, though not beautiful; her figure light and graceful; and she possessed that winning charm of manner with which her mother's race is so richly gifted.

"Her father was occupied all day long with his business; when he returned home of an evening, it was only to sleep in an old arm chair by the fireside. She had no companions, and was too much busied with her teaching and household affairs to mix much in the gaieties of the adjoining town; but she was always sought for: besides her good, kind heart, winning ways, and cheerful spirit, an aunt of her father's had left her a little fortune, and she was looked on quite as an heiress in the neighbourhood. The young gentlemen always tried to appear to their greatest advantage in her presence, and to make themselves as agreeable as possible. She was, perhaps, the least degree spoilt by this, and sometimes tossed her little head, and shook her long black ringlets quite haughtily, but every one that knew her, high and low, liked her in spite of that, and she deserved it. About four years ago, at a small party given by one of her friends, she met, among other guests, the officers of the infantry regiment quartered in the neighbourhood. All were acquaintances except one, who had only a few days before arrived from England. He did not seem inclined to enter into the gaieties of the evening, and did not dance till near the close, when he got introduced to her. As soon as the set was over, he sat talking with her for a little time, and then took his leave of the party. She was flattered at being the only person whose acquaintance the new-comer had sought, and struck by the peculiarity of his manner and conversation. A day or two afterwards he called at her house; she was at home, and alone. A couple of hours passed quickly away, and, when they bid good evening, she was surprised to find it was so late. After that day the acquaintance progressed rapidly.

He was about six or seven and twenty years of age, the only son of a northern squire of considerable estate, but utterly ruined fortunes. His father had, however, always managed to conceal the state of affairs from him till a few months previously, when an accidental circumstance caused it to reach his ears. Without his father's knowledge he at once exchanged from the regiment of Hussars in which he then was, to an infantry corps, met the most pressing claims with the few thousand pounds this sacrifice placed at his disposal, and went home for a few days to take leave of his parents before joining his new regiment in Canada. At first they were inconsolable at the idea of parting

with him, even for this short time; for all their love, and pride, and hope, were centered in their son, and he, in return, was devotedly attached to them. Soon, however, they were persuaded of the wisdom of what he had done; and, deeply gratified by this proof of his affection, with many an earnest blessing they bade him farewell. Of an ancient and honoured family, he bore the stamp of gentle birth on every limb and feature. His mind was strong, clear, and highly cultivated; his polished manner only sufficiently cold and reserved to make its relaxation the more pleasing. In early life he had joined in the wild pursuits, and even faults, which indulgent custom tolerates in the favoured classes; but still, through all, retained an almost feminine refinement and sensibility, and a generous unselfishness, sad to say, so seldom united with the hard, but useful knowledge of the world. Though rather of a silent habit, whenever he spoke his conversation was always interesting, often brilliant. Such was her new acquaintance. Poor child, in her short life she had never seen any one like him before; she was proud and happy that he noticed her; he, so much older than she was, so stately and thoughtful, and he spoke so beautifully. She was rather afraid of him at first, but that soon wore away; she fancied that she was growing wiser and more like him; she knew she was growing nearer, nearer; fear brightened into admiration, admiration warmed into love. Without a mother, or grown-up sister, or intimate friend to tell this to, she kept it all to herself, and it grew a stronger and greater tyrant every day, and she a more submissive slave. He now called at the house very often, and whenever there was a country driving party, he was her companion; in the ball-room, or riding, or walking, they were constantly together: it was the custom of the country. No one thought it strange. So passed away the winter: in summer the regiment was to return to England, but he had become much attached to the simple Canadian girl. Her confidence in him, her undisguised preference, joined with a purity that could not be mistaken, won upon him irresistibly. He saw that her mind was being strengthened and developed under his influence; that she did her utmost to improve herself, and enrich the gift of a heart already freely, wholly given; he felt that he was essential to her happiness; he fancied she was so to him. They had no secrets from each other: he told her his prospects were ruined; that his father's very affection for him, he feared, would make him more inexorable in withholding sanction from a step that might impede his worldly advancement; that the difference of their religion would add greatly to the difficulty. His father's will had ever been his law: before it came to the old man's time to 'go hence and be no more seen,' it was his fondest wish to be blessed with a father's blessing, and to hear that he had never caused him a moment's anxiety or regret. Then they sat down and consulted together, and he wrote to his parents, earnestly praying them to consent to his wishes for this union, appealing to their love for him, and using every argument and persuasion to place it in the most favourable light. He doubted and trembled for the reply. She doubted not. Poor child! She knew that in the narrow circle about her, she and her little fortune would be welcomed into any household; beyond that she knew nothing of the world, its pride, its luxuries, its necessities; it was almost a pleasure to her to hear that he was poor, for she fancied her pittance would set him at ease. In short, she would not doubt, and waited for the answer to the letter, merely as the confirmation of her happiness. Weeks have passed away; the time of the departure of the regiment is close at hand, but the English post will be in to-morrow. The delay has been a time of eager anxiety to him, joyful anticipation for her. They agree to open the answer together. The post arrives. A heap of letters are laid on his table. He snatches up one, for he knows the handwriting well; it is a little imperfect, for the writer is an old man, but hard, firm, determined.

He hastens to her house: they do not speak, but go out into the garden, and stop at the end of the walk on the little terrace. The view over the broad rich valley is beautiful to-day; the young summer has painted earth in all her choicest colouring, but they do not observe it, they are looking on the letter; he pale, almost trembling, she flushed with happy hope—her tiny fingers break the seal. The summer evening of her land has but little twilight; the sun, like a globe of fire, seems to drop from out the sky behind the earth, and leaves a sudden darkness. So, as she read, set the sun of hope, but the night that fell upon her soul had never a morning."

ALI ABEN FAHAR.

BY ANNABEL C—

[The subject of the following ballad is taken from Washington Irving's, "Chronicle of Granada." After the reduction of Baza, by Ferdinand and Isabella, numbers of the Alcajdes of the neighbouring cities came to deliver the keys to the victorious sovereigns, thereby hoping to retain their lives and property; though at the expense of their faith to their king and country; nor were they disappointed; Ferdinand not only gave them these, but heaped upon them riches and honour, and with these, as if they were the only things worth living for, they went away content, and forgot how many childless widows, how many weeping orphans, and how many brave hearts now surrendered to the enemy, poured down curses upon their heads. For the honour of fair Granada, not such were all her sons;—Ali Aben Fahar was one instance, among many others, of a noble knightly soul.]

Woe, woe, for fair Granada!
Woe for her glories fled!
For her ruined halls, and her roofless walls!
For her heart within her dead!

O realm of peerless beauty!
Fair, but, oh, fallen queen!
Where are thy towers, thy orange bowers,
Queer in the sunlight seen?

Where is thy pride, Alhambra?
Where is thy regal roof?
But where are they who were true alway?
Where are thy hearts of proof?

All dead! all dead! departed,
But they died in gallant fight,
While the battle cry filled the echoing sky;
They died for their country's right.

Oh weep not for them! in glory
Like stars do their names shine out,
And their voices come from their dreamless home
Like a warrior's battle shout.

But wail for the false, false hearted,
For the traitor hearts who gave
To the foe's hand their glorious land;
Surrendered her up for a slave.

Oh shame, it should live in story
Granada's sons should ere
Their country have sold for the love of gold,
The fairest, 'mong all that is fair!

But, no! let us speak not of traitors;
Shame on their memory rest;
Let us speak of one who stood forth alone,
Whose spirit could stand the test.

High on his throne exalted
Sate the king of broad Castile,
While a circle fair formed his nobles there,
In arms from head to heel.

And on her throne beside him,
Sate his well-beloved queen,
With her gentle eye, and her spirit high,
And her bearing all serene.

And round her stood her ladies,
Stars to a warrior's sight,
Whose pure souls gave strength to the brave,
A watchword in the fight.

And the tent it shone with purple,
Like to a royal hall,
And gems and gold, of worth untold,
Hung on the canvass wall;

And o'er it proudly waving
Spread the banner of fair Spain,
And round about stood the warriors stout,
Who had fought for her again.

High joy and exultation
Sate in the king's dark eye;
And the warriors boid their triumph told,
In their bearing proud and high.
But the joy that shone, in the queen alone
Was tempered by a sigh.

For she saw before her standing
Granada's sons, who came
Their homes to sell, they loved not well,
And she sighed for their shame.

That gentle queen felt sorrow,
For she knew the bitter grief
That some must feel through plate of steel;
A woe that mocked relief.

Oh land renowned in story!
How could they fall so low?
How could they e'er, thou land most fair,
Have thee forgotten so?

Fair gold and jewels glittered
Each traitor hand within,
And soft words hung on the royal tongue,
As guerdon for their sin.

And the keys of each fair city
Before the king they laid;
Oh, may each name, for that deed of shame,
Rest in oblivion's shade.

Within the tent was standing,
Ali Aben Fahir,
Good knight, and true, as ever drew
His iron sword in war.

He stood apart, and mourning,
And the warrior's face was stern,
And his writhing heart, in its deepest part,
Did for his country yearn.

With treasure deeply laden,
Each traitor chief past by,
And he stood alone by the monarch's throne,
With sad, but stedfast eye.

In a voice where anguish mingled
With the warrior's haughty tone,
He spake aloud, and scarce he bowed
Before the monarch's throne.

"A Moor am I, descended
From a noble Moorish race,
On whose fair name no cloud of shame,
Hath ever found a place.

"Parahana and Paterna,
When rose this morning's sun,
Owned me their lord, with one accord,
O'er tower and town each one.

"His setting now beholds me
A wanderer on the earth,
A homeless one, whose course must run,
From the land that gave him birth.

"Here are the keys, oh monarchs,
For yours they now must be,
For those who should have by me stood,
Have turned their backs to flee."

Then Ferdinand commanded
To bring forth store of gold,
And give it thee as guerdon fair,
For the cities he had sold.

But with haughty stern demeanour
The Moor he put it by,
And the kindling fire of noble ire,
Flashed in his eagle eye.

"I come not here before ye
To sell what is not mine,
But by Fate's decree, they thine must be,
And, therefore, they are thine.

"But of this be ye certain
Did others stand me by,
With only life would I end the strife,
And not with treachery."

Then the princess marvelled greatly
At such a lofty soul,
And much they sought he should be brought
Beneath their own control.

But the proud and noble Moslem
He scorned in warlike weed
To couch his lance in the fierce advance
Of foes to his land and creed.

Then with voice of silver sweetness,
Queen Isabel she spake,
"Is there nothing we can do for thee?
Do nothing for thy sake?"

"Yes," answered then the Moslem,
"Behind me have I left,
Full many a one in grief, alone,
Of every hope bereft.

"They could not tear themselves away
From the bright land of their love,
The land that wound their hearts around—
The land for which they strove.

"Then give your royal promise,
That they shall rest secure,
And, as of old, that they shall hold
The holy faith and pure."

"We promise it," saith Isabel,
But surely there must be
Some little thing, that we can bring,
To show our love for thee?"

"No, lady kind," he answered,
"I ask for nothing more,
Than leave to go to bear my woe,
Unto the Afric shore."

Fain would the noble princes
Have given him gems and gold,
And gallant steeds, in warlike weeds,
For the love they towards him hold.

But the Moor thought shame and sorrow,
Himself in wealth to be,
While deep in woe lay his country low,
No more among the free.

His servants, steeds, and armour,
He gathered all to him,
And bade adieu to a faithful few
Whose eyes with tears were dim.

And with brow stamped with anguish,
But without a single tear,
He rode away, and left for aye
The land he held so dear.

He left her lovely valleys,
For Afric's burning sand,
For the warrior's death, and the warrior's wreath,
For the fame of his native land.

Bianca.

BIANCA.—A BALLAD.¹

BY JAMES BANDING, C.L.E.

It was a summer evening, by the deep deep azure sea
Which gently laves, with tideless waves, the shores of Tuscany;
The glorious sun was sinking to the chambers of the west;
The gentle breeze, the rippling seas, were lulling him to rest;
And the heaven was deepest blue above, yet warm with rose below,
Like a holy maiden's deep pure love, heighten'd by passion's glow;
And the clouds that had been white that morn were rold in crimson state,
Like they whose youth was sinless, and whose age is good and great.

And a maiden stands upon the strand, and gazes on the sea,
And then she turns towards the land, and looks right wistfully;
She looks towards the mountain, with its stern and stately pride;
She looks towards the fountain, that is sparkling from its side;
She looks upon the shadows, that are coming on apace,
And tell her that the hour is come to seek the trysting place.

"Four weeks have pass'd since last we met—why make this long delay?
And yet my bosom tells me he will surely come to-day;
Yes, though he tarries he will come, come to redeem his plight,
And place the ring upon the hand already his by right;
Yes, though I be a peasant girl of joyous Tuscany,
And he an English gentleman of wealth and high degree!"

Oh! she was brilliant as the light, and lovely as the dream,
That glads the youthful poet's sight, who sleeps by haunted stream;
Her dark rich ringlets softly flowed around a dazzling brow;
Her cheek like northern sunset glowed, that melts away in snow.
But how can northern pen portray the glory of that eye,
Which shone without a rival even in sunny Tuscany?
Her form surpass'd whate'er the art of sculptor yet hath given,—
Their's is but loveliness of earth, her's too was that of heaven;
For, breathing through its living shrine, her spirit, lustre pure,
Beam'd like some light which brightest gems seem almost to obscure;
It was the soul, the living soul, that matchless form within,
Which shone in its baptismal garb, unsoil'd, undimm'd by sin.

And now another form appears, his face is thin and pale,
His reverend head is white with years, and yet his step is hale,
For he is one of those whose feet have always kept the way
Where none with sin and luxury meet, to steal our strength away;
In truth he was a holy priest, (and zealous for his God,)
Who show'd his flock the way to heaven, by walking on the road;
He stands before the maiden as she seeks the inland way,
And thus in stern, yet gentle tones, he seeks her path to stay:—

"The shadows of the mountain peaks are stealing o'er the bay,
Why hie you to the fountain thus at every closing day?"

"Nay, father, do not stay me now, I will not go again;
But this a vow that I have made, and I must not refrain."

"Ah, daughter, vows which maidens make are seldom wise or good,
Except it be a vow to take the veil of maidenhood;
I know thy secret, and I seek to save thee from the fate,
Which waits on lowly maidens woo'd by youths of high estate;
A moment of delirium—an hour of doubt and care—
A life of desolation—and a death-bed of despair.
What though thy form be graceful as the lily in its pride?
What though thy cheek be lovely as the rose that blooms beside?
What though thy heart be fonder than the widow'd emmet dove?
What though thy soul be purer than the stars that shine above?
And thou lookest like a seraph that hath brought good news from high,
And charms us as it plumes its wings to seek its native sky?
What though thy lover kneel to thee, and pledge the solemn vow,
That he will love thee always, child, as well as he does now?
Let not his words, however strong, thy trusting heart decoy;
He loves thee as a plaything, he seeks thee as a toy.
When he has gain'd the all he seeks, he'll leave thee for another;
If conscience or compassion speak, their tones he'll quickly smother.
Beware, my daughter, oh, beware, beware while yet 'tis time,
And follow not the meteor's glare, which lures thee on to crime;

(1) See illustration on the preceding page.

No guiding lamp, no beacon light, it beckons thee, poor lass,
To stray through sorrow's dreary night, and sink in guilt's morass.
My daughter! oh, my daughter! beware while yet 'tis time;
Hark, how from yonder convent swells the holy vesper chime!
It calls thee with a warning voice to bid the world farewell,
And hide thy yet unsullied head within a prayerful cell."

"Nay, father! holy father! I cannot, cannot stay,
My word is given, my faith is pledged—I must, I must away;
And thou dost wrong both him and me—thou dost, indeed thou dost—
The stranger has—and he deserves—the fulness of my trust."

And she is gone—and he remains to breathe the fervent pray'r,
And call on Heaven to save her from the many tangled snare—
* * * * *

And she has reached the trysting place—but *he* is not yet there,
And she hath knelt, and offered up a deep, though silent prayer.
But hark! that sound!—she turns her round, with swift and sylphlike grace,
And lifts her hand to shade her eyes, and screen her gentle face;—
On yon hill-side appearing, she sees a cavalcade;—
The fountain they are nearing,—why does she feel afraid?
Their leader gives the word to halt, and now moves on alone;
'Tis *he*, she cannot err, 'tis *he*—her Edgar, still her own.
But no!—a lady young and fair remains by Edgar's side;
He speaks to her in tones of love,—“alas! It is *his* bride.”

One piercing shriek Bianca gave; and now her pangs are o'er;
Lifeless and cold, alas, she lies, the perjurd one before;
The chill of death comes o'er her,—that awful, still, still sleep,
Whose secrets none can pierce or guess—dark as th' unfathom'd deep.
And now she wakes, but wakes not as she woke in other years,
To gladness and to sorrow, to smiles, and sighs, and tears;
But still, and shadow-like she feels, whilst o'er her broods a gloom,
As we may well believe, enveils the tenants of the tomb. —
And it must be the Seraph, that watch'd over her on earth,
And now has come to smile upon her mystic Eden birth,
That form of angel loveliness, half human, half divine;
She draws across her bosom the blest Redeemer's sign;
She draws across her breast the sign which tells how Jesus died,
And bids his faithful people think upon the Crucified. —
But see that form approaches, it beckons her be still,
And prints a kiss upon her cheek, nor shadowy nor chill.
Those warm lips move.—What say they?

“Bianca! do not speak,
For should you now be lost to him, my brother's heart will break;
He would not seek your face, Love, till he sought you as his bride;
He would not lead you home, Love, till I could be your guide.”——
* * * * *

And the holy father joins them in the bonds of wedded love,
And gladly sheds upon their heads the blessing from above.
Bianca leaves her lowly cot, her deep blue Tuscan sky,
To dwell in ancient British halls, and mix with nobles high;
And noble as the noblest there, and fairest of the fair,
There were few in grace or beauty with Bianca could compare.
Yet though she grac'd both court and hall, and shone amongst the great,
She ne'er forgot the lessons learnt when in her peasant state.—
To the humble she was humble, like a mother to the young,
Or a gentle elder sister to the hearts which grief had wrung.
She was a crutch unto the lame, a staff unto the weak,
A comfort to the sorrowful, a shelter to the meek;
The refuge of the orphan, and the hope of the oppressed;
Defending the defenceless, and relieving the distressed.—
She ne'er forgot that though our God hath fixed by firm decree
To each his lot, his task, his post, his rank, and his degree,
And some are born with Right Divine to honour and to sway,
And others, each in various ranks, to labour and obey;
Still we are all the creatures of ONE ALMIGHTY God,
The *breathings* of ONE SPIRIT, the *crumbings* of one sod,
The children of ONE FATHER, and the sharers of one blood,
The heirs by full and true descent of Tophet's fiery flood,
Redeem'd by ONE OBLATION, and marshal'd by ONE GUIDE.
Where God and Nature say, “Unite,” oh, let not man divide.

THE MAIDEN AUNT.—No. III.

CHAP. I.

"PEGGY," said Owen to me, one morning, as he threw himself back in his easy chair after completing the perusal of the newspaper, "did you know that poor Kinnaird had left a daughter?"

What an inexplicable creature I am! I have passed my forty-fifth birthday, but I cannot yet hear that name uttered without emotion! However, Owen is the last person in the world to suspect such a thing, and the last person I should wish to suspect it; so, after a moment's pause, I answered, in my usual tone,

"Yes, I remember to have heard it. And is she your ward, as well as the son?"

"Even so," replied he; "and an immense heiress she is—a beauty too, they tell me. She is past eighteen, and cannot be kept any longer at school, so I have now the agreeable task of finding some one to take care of her till she is pleased to relieve me of the responsibility by her marriage, which I should think will not be a very distant event. I wish *you* would take her off my hands in the mean time."

"My dear Owen, you are not in earnest. I cannot fancy any one less fitted than myself for such a charge."

"Don't be modest, sister. You know, without compliment, you are the very best manager in the world, and you have that kind of knack at discovering and indulging the peculiarities of those with whom you live, which would make you an invaluable companion."

"Yes, yes," interrupted I, in a bantering tone, "you made that discovery when you and I tried the experiment of living together eight years ago. I suited you to a nicety."

"Oh, then indeed," returned Owen, making a long face and looking a little embarrassed, for the experiment alluded to had been a complete failure, and had been abandoned by mutual consent at the end of the first month; "but that, you know, was a peculiar case; and after all, when I think it over, I am convinced it was more my fault than yours—wholly my fault, I may say. I am not *now* exactly what I was *then*."

"Of course not," replied I gravely, "eight years have been allowed to you since then for the study and improvement of your character, and you are doubtless an altered man. Suppose we try the experiment again—I am perfectly ready, and I have no doubt it would come this time to a widely different issue."

Owen's candid and complimentary humour was a little at fault here; he had not expected to be so immediately taken at his word. "Why, to say the truth," began he, with some confusion, "my confirmed bachelor habits—"

"What are you saying about your confirmed bachelor habits?" cried our friend, Mrs. Alvanley, entering the room, and proving to Owen, at least, a very welcome interruption to the conversation. "I will not allow any such high treason to be talked in my house."

Mrs. Alvanley was a lively handsome widow about Owen's own age; that is to say, somewhere on the verge of five-and-thirty. She was not deficient in ability, though extremely fond of dress and amusements—tastes which her small means gave her very few opportunities of indulging. Before her marriage she had received considerable attention from Owen, who, it must be confessed, had always been a great flirt, though I do not think that he had ever fairly committed himself with any one; certainly not with Mrs. Alvanley. She was now suspected of a design of reconquering her former vassal, with how much reason I cannot pretend to say; but it is certain that she liked and sought Owen's society, while he, on his part, appeared, to a cool looker on, quite willing to resume the footing, half playful, half sentimental, on which he had formerly stood with her, and quite determined not to advance an inch beyond it. The usual residence of this lady was near Alford, a country town in Devonshire, in the neighbour-

hood of which the happy years of my youth had been passed, and where I had many friends. At present, however, a cousin who lived at Teignmouth had lent her a house for the month of October, and she had invited Owen and myself to become her guests.

Owen turned towards her with that air of ready deference which, sometimes mingled with a shade of sarcasm discoverable only by a quick observer, characterized his demeanour towards women, especially towards those in whose good graces he thought it worth while to secure a place. "It would indeed be a rash man who should venture to celebrate the praises of single blessedness in *your* presence," said he, with an equivocal smile. "But you are come in the very nick of time. I want your advocacy. We were talking about the Kinnairds."

"No such thing," cried I, "we were talking of the time when Owen and I tried to live together, and found that we couldn't bear each other. Do you remember it, Mrs. Alvanley?"

"To be sure I do," replied she, laughing. "All the world said there would be a permanent coolness in consequence, but I knew you both better. Let us call upon your brother to justify his share in the transaction, and afterwards we will hear your defence. Now, Mr. Forde, what have you to say for yourself?"

Mrs. Alvanley wanted the fine perception and quick feeling which constitute tact, or she would have seen that Owen found the subject irksome and wanted to get away from it. He, however, fell readily enough into her playful tone for the moment.

"I will be judged by you," cried he; "no man could begin with better intentions than I did—I might almost say that no man could have endured more. Patiently did I suffer myself to be initiated into the mysteries of housekeeping. I knew when we had lamb in the house, and when we had mutton hanging up, and when the cook had tried all over the market and there was not such a thing as a bit of fish to be heard of. I was acquainted familiarly with the statistics of disease in the poultry-yard, and learned gradually to distinguish between pip and croop.—Once I labelled a dozen jars of raspberry jam in a single morning, another time I voluntarily reprimanded the housemaid when Peggy was afraid to speak to her."

"Owen, how can you be so absurd?" interrupted I, laughing, though inwardly annoyed.

"Well," continued he, still addressing Mrs. Alvanley, "all this and more I encountered like a man; but at last one morning—I think we had been living together about three weeks—my sister suddenly and without preparation, without breaking it to me, but as if it were the pleasantest and most natural thing in the world, proposed to me to give a children's party!"

"Now, Owen, how can you exaggerate so dreadfully?" cried I. "You know very well I only wanted to have Emily Drew's two sweet children, to spend the day with me."

"Sweet children, I have no doubt they were," returned Owen, "breathing the very essence of lollipops. But you were to have the little Harrisons to meet them. I stand to that. I have a vivid recollection of having a distinct, separate horror of the little Harrisons, over and above those two sweet Drews."

"Well, I believe I did talk of it," said I.

"There now!" cried Owen, "you see how far she is to be depended on! And there are five of the little Harrisons! Now I leave you to imagine my feelings on such an announcement. At first, I thought it was impossible, and then I thought she was insane; or, said I to myself, have I been living all this time in a dream, and am I not a bachelor after all, but am I a married man, and is this my wife? For you know it was inconceivable that any woman, kindly exempted by nature from the trouble of children, should endeavour to procure an artificial offspring for herself. That was out of the question."

"Owen, you really anger me," said I; "Mrs. Alvan-

ley, how can you let him talk in that manner? There is no feeling in the world so natural and so pure as the love of children, and I never can bear to hear him pretend to despise it; dear little innocent creatures!"

"Dear little innocent creatures!" echoed Owen. "Yes, there they sit, in their clean pinafores and best frocks, looking like a row of complete innocents, unable to give you a rational answer to the simplest question. And when they warm a little, and begin to play, they are always hitting their own heads, or kicking your shins by accident; and, if they are well brought up, they roar equally at both. Your best-meant schemes for their amusement are generally humiliating failures, rendering you ridiculous in the eyes of the bystanders. You begin to tell them a story, and harangue for five minutes, and then find they are not listening to you, or something equally unpleasant. I have myself seen Peggy steadily going to sleep in a corner for an hour together, with three hard-hearted urchins at play round her, not one of whom had the charity to go up and startle her, though she had shut her eyes only to induce them to do so. I never gave a child a sugar-plum in my life, that it did not begin to choke immediately."

"All single men talk in that manner," said Mrs. Alvanley, when she had recovered from her laughter; "wait till you have children of your own."

"Yes, I will wait—very patiently too," answered Owen; "I would much rather have half-a-dozen kittens than those two sweet little Drevs that Peggy is so fond of. A kitten is at least pretty, and graceful, and amusing, which a child is not; and you can always take it by the nape of the neck, and drop it into the cellar when you are tired of it—a thing which I should like to do in a similar case with a child, if it were not for the tumult which mothers and nurses would be sure to make about it."

"I cannot understand how you can laugh at him, Mrs. Alvanley," said I. "To me it is perfectly shocking. I have heard him say before, that he likes animals better than children, and I never can bear it. It is degrading to think of those dear little immortal souls, and then—"

"Now, Peggy," interrupted Owen, "what can you know about the size of their immortal souls?"

"Come, don't tease her so," said Mrs. Alvanley; "and my dear Miss Forde, how can you take everything so entirely *au pied de la lettre*? You do not understand your brother, yet, after all, he is not so very enigmatical. But it certainly is necessary to comprehend a person's character thoroughly, in order to live happily with him, and so I think it was very well that you two gave up keeping house together."

"And left me at liberty till I should meet with some one who can and does understand me," said Owen, with a bow and smile, which rendered the compliment so broad, as effectually to destroy its point. "But don't be wrathful, Peggy, I am only plaguing you. Let us go back to the Kinnairds."

"I had forgotten them," said I.

"Who are those Kinnairds?" inquired Mrs. Alvanley.

"Frank Kinnaird was a great favourite of my father's," replied Owen. "He was ten years older than myself, or more; and many and many a tip has he given me when I was a schoolboy and he a young man. Poor fellow! He married a great heiress, to pay his debts I believe, for he was imprudent enough. She had a temper which made his house an absolute pandemonium; and he had not been married to her above a twelve-month, when some distant relation died and left him a hundred thousand pounds—so he need not have sacrificed himself after all. How many years is it since Kinnaird died, Peggy, do you recollect?"

"Six years this summer," returned I, without lifting my eyes from my work. Did I recollect!

"So it is, I declare," said Owen. "How time slides away! Well, he left me sole guardian to his children. Mrs. Kinnaird, I forgot to say, had died a year before.

The boy went to college of course, and had a commission in the guards afterwards. He is the very counterpart of his father, in character; but, luckily for him, he had money enough to waste, so I was not forced to interfere with his amusements, and he has now been several years off my hands. The girl was younger. She was taken, at first, by a Scotch aunt, Kinnaird's sister, who lived in the highlands; and, just as I was beginning to think that a young lady of her expectations must necessarily acquire a few more accomplishments than she was likely to get in the region of gray mountains and oat cakes, this aunt very obligingly died, and I ran down there for a month, got some capital grouse-shooting, and brought my fair ward up to a first-rate London establishment to finish her education."

"Was she an engaging girl?" asked I, with irrepressible interest.

"She was rather under fifteen at the time," replied Owen, "and I have Lord Byron's horror of budding misses. Besides, she cried without intermission during the whole month, so that I had really no opportunity of judging of her personal appearance, further than that she was tall of her age, and had a most splendid head of dark brown hair: I remember noticing that particularly."

"I dare say she is well-looking enough to pass for a beauty when seen through the flattering medium of—how many thousand pounds?" observed Mrs. Alvanley.

"Seventy," returned Owen: "a pretty little fortune, is it not? But now comes the difficulty: this young lady is eighteen years old: a woman grown, as you see."

"In her own estimation, doubtless," interposed Mrs. Alvanley; "but most girls are little more than children at eighteen. She must be classed for a few years more among those budding misses of whom you and Lord Byron have so great a horror."

I was inwardly amused as I thought of Mrs. Alvanley's five-and-thirty years. Owen, who was growing rather cross as he found himself so repeatedly interrupted in his approaches to the point he was resolved to carry, answered her by saying in his blandest tones—

"Nay, Mrs. Alvanley, would you have me believe that the mind does not attain to maturity till the person has begun to lose its first bloom? Forgive me for differing from you; but, I remember *you* at eighteen."

The lady was effectually silenced, and quite uncertain whether she had received a compliment or an affront. Owen, who had intended to produce this very effect upon her, went on triumphantly, and finished his history without further disturbance.

"Well, as I was observing, Miss Edith Kinnaird,—(it is exactly the name for a heroine of romance)—was eighteen three months ago, and can't be kept at school any longer. My friend, Lady Frances Moore, has undertaken to superintend her *début* in the spring, so that trouble is off my hands: but here is October, and what in the name of ingenuity is to be done with her in the interval? Now I appeal to you, Mrs. Alvanley, whether it would not be an extremely pleasant thing for Peggy to pass the next five months in an elegant mansion, surrounded with all the luxuries of life, with no other drawback than the society of a high-born and highly-educated girl, in whom she may be supposed to feel some interest for her father's sake?"

"Were I your sister," replied Mrs. Alvanley, with animation, "I should consider such a suggestion as a very great favour. It is exactly the position I should like; and I also think it is that for which I am best fitted. What say you, Miss Forde?"

A sudden horror here came over Owen, that Mrs. Alvanley was going to propose to take charge of Miss Kinnaird herself. With his characteristic caution, he felt in a moment that such an arrangement might

lead to numberless inconveniences, not the least among which he deemed the appearance which it would have in the eyes of the world. It was far from his intention to have it supposed by any one that he meant to marry Mrs. Alvanley: so he turned to me with an appealing eagerness of manner, very unlike his usual nonchalance, and very difficult for a sister to withstand, saying—

"My dear Peggy, I am thoroughly and anxiously in earnest, and it is not like you to persist in trifling when such is the case. It would be still less like you, to let any petty obstacles stand in the way of an arrangement so rational, so natural, so thoroughly unobjectionable. Your consent will confer the greatest possible favour upon me, and upon your old friend's child; while it would really be affectation to suppose that it will entail any sacrifice upon yourself. Were it likely, or even possible, that it should do so, I would be the last person in the world to ask it of you; but I do assure you, that in suggesting the plan, I was very considerably influenced by the idea of the pleasure that it would be the means of procuring for you."

I was touched—impressed—gratified; in short, I gave my consent. And when it was irrevocably pronounced, I was a little surprised by discovering the advanced state of Owen's arrangements, which seemed to prove that he had counted upon me as an auxiliary long before he named the subject to me. He would at least—so he said—spare me the trouble of discussing and deciding; an occupation which he knew to be peculiarly unsuited to my natural taste. So he named the house in which Miss Kinnaird and I were to take up our abode, and which he appeared so sure of obtaining, that I could not help suspecting that he had already opened negotiations for it; and he even fixed the day on which the young lady was to be summoned from the academic shades of her abode in the Regent's Park. He kindly left it to me to determine the precise number of weeks, days, or hours, by which my arrival at Enmore Hall was to precede that of Miss Kinnaird; only suggesting that it would be as well if, for the sake of my own comfort and convenience, I could manage to have about a fortnight quietly to myself, in order that I might get thoroughly settled in my new residence, acquainted with my new household, &c., &c.; so that I should be ready to receive the young lady in a manner satisfactory to myself;—and this modicum of liberty was pretty nearly all that was allotted to me in the matter. I did not, however, quarrel with this specimen of Owen's diplomacy; for I have a natural horror of responsibility at all times, and a special horror of it when Owen is the party to whom I have to answer; so I comforted myself for any little injury that my dignity might have sustained by reflecting, that since he had made every arrangement himself, he would have no one but himself to blame if the results should prove unsatisfactory. Thus I was able to delight my brother by the cheerfulness of my acquiescence in all his proposals; and in the plenitude of his triumph he deigned to delight Mrs. Alvanley by reminding her that Enmore Hall was only three miles from Alford; and assuring her, that he trusted much to her well-known kindness for rendering Miss Kinnaird's sojourn in that part of the country agreeable. It was settled that I should proceed to Enmore immediately after my departure from Teignmouth, and that my young charge should join me about a fortnight later, under the escort of her brother, who, Owen believed, had taken a shooting-box somewhere in the neighbourhood, and who was described as passionately fond of his sister, and impatiently anxious to enjoy every available moment of her society now that she was passing from childhood to womanhood. Owen hoped to come down himself after Christmas, but was too full of engagements, for the present, to determine the precise time at which he would join our party. And so the matter ended; and I was left alone to reflect, as calmly as I could, upon the singular series of trifling circumstances which had at last placed me in the posi-

tion of guardian to the daughter of the only man I had ever loved, and who—the *thought* is present to me, so why should I shrink from the *word*?—had alighted me. I was eighteen again, in imagination, so buoyant, so happy, so energetic—pursuing a thousand fancies, busied with a thousand studies; and he was at my side to guide all by his judgment, to give zest to all by his sympathy, and to make my heart beat quick, and my cheeks glow, by those admiring looks and approving words, so immeasurably different from *compliments*, because they are always involuntarily, and often unconsciously, offered,—so sweet, I must *now* write—so dangerously sweet, when they come from one whom we love as a friend, and look up to as a superior. Was it wonderful that I mistook all this for the indication of a feeling which I have now no right to believe that he ever entertained? Yet I am acting a part, even to myself, when I say that I do not believe it. I thought of our parting, of the warmth, the devotion of his manner, so far outstripping the mere *intimacy* which, in some sort, justified its expression. I never saw him afterwards. Tidings came, first of imprudence, then of extravagance,—repeated, reckless, unpardonable extravagance,—and three years after that parting, I heard of his marrying, as Owen said, "an heiress, to pay his debts!" What those three years were to me I do not wish to remember, and it would be useless to describe. The beauty of my life had departed from me. But, thank God, it went but for a season, and has returned, though in another and less radiant shape. In the expansiveness and activity of those affections which I once thought I would never again suffer to cling around aught upon earth, I have found health and happiness for my wounded spirit. Of the holier discipline, under which I trust that I am learning to chasten those exuberant affections, or rather to guide them into a channel where there can be no overflow, and fasten them upon an object where there can be no disappointment, I dare scarcely presume to speak; yet incomplete indeed would be the record of my thankfulness for what I have endured, and for the peace which has been vouchsafed to me, did I omit all allusion to my true remedy, my real strength, my only sure hope. But enough, and more than enough, of this; the more deeply I feel that the concerns of daily life ought to be pervaded and sanctified by a spirit of devotion, the more reverently do I desire to separate and to solemnize all distinct expression of that spirit—that so we lower not our religion to the level of our habitual thoughts and common words; but rather jealously guard its elevation, and seek, if we may, gradually to lift them to it.

* * * * *

HISTORY OF THE COTTON MANUFACTURE.

Let us now trace the progress of the inventions which, beginning with the spinning-wheel, have conducted the manufacturer to the almost self-acting machines, moving thousands of spindles by a mechanism the marvellous perfection of which is worthy of note, as evincing the ingenuity of man ruling the material world. Some may, perhaps, deem this perfection of mechanism no blessing to the land, and recall, with fond regrets, the old spinning-wheel, singing under the cottage-porch, through the long summer days. Bright is the vision, and cheering to all hearts the tranquil scene of England's rural life in times when the old spirit of romance rested on cot and hall. But what avails regret for those departed days? The England of that age had her brightness, and let us hope that the advance of

knowledge, in modern times, is not necessarily accompanied by the degradation of our land. Machinery is a result of human intelligence; and surely all that is fair and noble may exist within the sound of wheels and engines, with as much safety as when listening to the roar of cataracts in the wild regions where man lives in his state of rusticity. Some are egregiously silly upon this subject, and *rave*—surely thoughtless declamation is *raving*—about the picturesque, and the romance, of that state of society which owes its chief attraction to the facilities it affords to the landscape painter for sketching long heaths and wild moors, or adorning his portfolio with crumbling cottages covered with ivy; picturesque things enough in the distance, and sometimes beautiful when viewed with closer attention, but often concealing, beneath that external beauty of wild nature, homes where ignorance and fever deepen the sufferings of poverty. Let us now, however, whether hailing or regretting the advance of machinery, follow its progress from the first small beginning to the present far-extended system of manufacturing power.

The reader is requested to observe, that cotton spinning had passed through three stages before the beginning of the eighteenth century. The distaff and spindle were of course used by the ancient spinner, who produced a few yards by the exercise of much patience. The next step was the use of a wheel, which, being turned by one hand, gave motion to the spindle by means of a strap running over a groove, whilst the other hand managed the cotton. The treddle-wheel succeeded, in which the machine was turned by the foot, leaving both hands at liberty to work the thread. Here improvement seemed to stop, and at the beginning of the eighteenth century the spinning-wheel still held undisturbed its ancient rule, as yet not darkened by the advancing form of its future gigantic and all-conquering rival, the steam spinning machine. The simple wheel, in the hands of aged matron and "young spinster," went merrily on, but a call was rising for more twist than it could furnish, and at a cheaper rate than its comparatively slow-paced motion could supply. The quiet wheel would doubtless have quickened its energies, and infused a new life into its old spokes, could time be given to look about, and clearly see what its taskmaster, the great world, required. But that same world will not wait; it votes the spinning-wheel far too slow, and summons, with mighty voice, its keen-sighted, hard-headed children to the task of creating new means for the satisfaction of its wants. The cry was answered, and Arkwright, Wyatt, Hargreaves, Cartwright, and Crompton, came forward with elaborate inventions, and gigantic powers, before which the spinning-wheel was swept away, like a child's toy-ship by the rising tide. Let us trace these various stages by which the powers of the cotton manufacturer have been so rapidly advanced.

Mr. John Wyatt, of Birmingham, may be regarded as the first leader of the noble band of inventors, though his fame has been, in some degree, overshadowed by the splendid success of Sir Richard Arkwright. Wyatt, however, must be remembered as the maker of a machine by which the *first thread of cotton* ever made without the human hand was spun; this happened in the year 1733, and from that period the doom of the ancient spinning-wheel was sealed. But its downfall did not immediately follow the invention of Wyatt, whose machine failed to effect what may certainly be called a revolution in the cotton trade. Wyatt did, it is true, set his instrument to work, but his moving power was derived from two asses which thus rather humbly preceded the modern steam-engine. He failed in his attempts, and the spinning-wheel seemed triumphant over its daring assailant. Wyatt had taken out a patent for a *rolling machine*, but not in his own name, the ostensible patentee being a Lewis Paul,—the real inventor choosing to affix his name as a witness to the record, in company with Samuel Guy. Wyatt was

residing in a village near Lichfield when the idea of his machine occurred to him, and there, in solitude and anxiety, he constructed a model two feet long, with which miniature engine he commenced his experiments. He afterwards described the excitement of the hour when the machine began to work, and "the pleasing, but trembling suspense," which accompanied the production of this first thread-making machine. This happened about 1730, though the patent was not taken out till eight years after. This invention seems to have included the principle on which Arkwright's machine was afterwards constructed; viz. the double pair of rollers; one pair *moving faster* than the other, and so stretching the sliver. The engine is described in the specification of the patent as "a new invented machine or engine for the spinning of wool and cotton."

This patent has only been discovered of late, though sought for a long period by those who felt assured of its existence. An earlier discovery was prevented by the fact, that the patent was taken out in the name of Lewis Paul, whilst one in the name of Wyatt had been the object of the search. Neither Wyatt nor his friend Paul possessed many pecuniary resources, and the expenses attending the invention brought the former to a prison about 1741, only three years after the date of the patent. This unfortunate inventor seems to have had some notion that the world would, at a distant period, rightly appreciate his invention, as he carefully wrapped up some yarn, spun by his machine in the year 1741, in paper, on which he wrote the following:—"The inclosed yarn spun by the spinning-engine without hands about the year 1741. The movement was at that time turned by two or more asses, walking round an axis in a large warehouse, near the well, in the Upper Priory, Birmingham."

Wyatt's invention was the foundation of Arkwright's fame, for none can fail to perceive the principle of the former's patent in the water frame of the cotton knight. But Wyatt was prevented, by pecuniary difficulties, from developing the powers of his machine, and found himself unable to attract the support of those great capitalists who ultimately made colossal fortunes by the means he had indicated. Wyatt's time was occupied in travelling for orders through the cotton districts, a routine absorbing those days which might have been devoted to the development and improvement of his engine. The first ideas of the acute minds are often entangled with other trains of thought, or their greatness imperfectly seen. Time and work are therefore required to expand that, to modify this, and combine all in one harmonious whole. Newton's "System of the Universe," as given by him to the world after receiving his final touches, is probably very different from the fleeting thoughts which often displayed their images before his mind when first he read the starry oracles, and listened to the intimations from the depths of Heaven. Time enabled him to bring out as from a cavern the lurking truths, and long labour gave forcible combination and living power to his new ideas. Such opportunities Wyatt desired, but they ever kept aloof, and least of all did they visit him in the gloom of that prison from which, in 1741, he wrote to Sir Leicester Holt, praying the knight to vote for a bill tending to the relief of insolvent debtors. The inspiration which comes to genius may at times utter its voice within prison walls, but the sharp angry sounds of "debt," "creditors," "bankruptcy," have power to scare off many a bright image and deep speculation which might have produced harvests of honour under happier scenes.

Wyatt, therefore, found himself beaten by the mighty power of circumstances, and gave up his inventions to Lewis Paul, who took out fresh patents for various alterations, but failed in discovering the path to fame and riches.

Wyatt died in 1766, leaving a name long honoured by those able to appreciate his unrewarded efforts, and sympathize with the disappointments of his family. In

conclusion, let it be remembered, that the invention of the modern carding machine is due to Wyatt, its *improvement* to those who followed.

The next whose name must be mentioned amongst the improvers of the cotton spinning machine is Hargreaves. He was a poor weaver, living at Stanhill, near Blackburn, within a short distance of the great cotton works of Sir Robert Peel, who became one of Hargreaves' earliest supporters.

This humble man was directed, like many other discoverers, to his labours by an accident. A spinning-wheel was suddenly overturned in his room, and continued to turn round as it lay upon the ground, the spindle revolving in a perpendicular position. Hargreaves noticed the occurrence, and the thought instantly struck him, that a number of spindles might be made to revolve by the motion of a single wheel; he remained for some time gazing at the wheel as it whirled round, and saw at a glance the solution of a problem which had for some time puzzled him. Hargreaves had repeatedly tried to move several spindles by the common wheel, but the horizontal position of the spindles had always perplexed his operations. But he now saw how the object might be accomplished, and immediately commenced a series of experiments, which ended in the production of the *Spinning Jenny*; the first machine was exceedingly rude, being made with a pocket knife and such tools as his cottage could furnish. With this engine, which turned eight spindles, he began to work for himself, hoping thus to increase his income by the quiet exercise of the jenny. He might probably have made by this means a little fortune for his family, as he gradually increased the number of his spindles to twelve, and sixteen, but some member of his family could not refrain from boasting of the abundant work performed at home. The spinners heard of Hargreaves' operations, and, attacking his house, broke the machine to pieces. He was, however, resolved not to abandon his projects, to gratify the wild spirit of a tyrannical mob, and retired to Nottingham in 1768, for greater opportunities of advancing his discoveries. He procured a patent in 1770 for the spinning jenny, but as Arkwright's inventions were already in the field, and Hargreaves died in 1778, he failed to acquire a fortune; besides which, he had communicated so much of his various improvements to others, that little exclusive benefit could be derived from the exercise of his machine.

He, however, constructed secretly a number of jennies for a Mr. Shipley, at Nottingham, and also went into partnership with Mr. James, by whose aid he built a small mill at Hockley. It now seemed probable that the poor weaver of Stanhill would reap the reward of his efforts; but the very men who had laughed at his experiments were now ready to take every advantage of his toils, by infringing his patent, and adapting his machinery to their purposes. Hargreaves resolved to vindicate his rights by legal proceedings, and threatened his rivals with actions. They however, formed an association to resist the poor inventor, to whom they offered 3000*l.* as an indemnity for the losses he had sustained. Hargreaves felt that such a sum was utterly inadequate as a compensation for the expenses already incurred, and the labour undergone by himself and partners, and therefore demanded 7000*l.* This was refused, and the appeal to law resolved upon. But now appeared the cruel result of Hargreaves' poverty. He had been induced to *sell* some of his jennies, and, this being discovered by his lynx-eyed rivals, the success of his lawsuit became hopeless. Hargreaves was, therefore, left without protection, and to the patronage which the more liberal manufacturers might extend to one who had opened the road to opulence for thousands. Hargreaves might, nevertheless, have reasonably hoped to share in the general prosperity attending the cotton manufacture, as the jenny now turned eighty spindles; so rapidly had its powers increased since the day

when the first rude machine with its eight spindles began to work.

He was patronized by Mr. Peel, who adopted the jenny, on account of which his factory was attacked by a rabble,—the machinery broken, and flung into the river. Mob fury was, however, a feeble barrier when opposed to the great interests involved in the cotton trade, and the efforts of skilful mechanists; the progress of machinery was, therefore, rapid, and it might have been supposed that Hargreaves was in the road to fortune. This probability seemed strengthened when he joined in partnership with Arkwright, his great rival. But want of money compelled a dissolution in about a year, when the former was left to struggle with pecuniary difficulties, whilst Arkwright, being joined by capitalists, proceeded in his profitable speculations.

Hargreaves' expectations were therefore disappointed by the rising genius of Arkwright, who possessed a singular power of adapting to his own purposes every improvement, and combining the inventions of others with his own. Hargreaves did not grow rich; the rivalry of others, and his own want of education, prevented this; but neither was he visited by that extreme poverty which some have represented as embittering his latter days. He did not die in a workhouse, as some say, but in his own house beside his mill, in 1778. What was the exact value of Hargreaves' labours? The invention of the *Spinning Jenny* was his work, which enabled the spinner to produce a hundred-fold the quantity of yarn manufactured under the old system. This was a decided advance in the manufacture, the honour of which no subsequent improvement can take from Hargreaves. Before this, the weaver was often compelled to suspend his work until the spinning wheel could produce the warp or weft required by his labours, but when the jenny with its host of spindles took up the task, no loom, however active, could consume more than the spindles were ready to produce. Without such producers of cotton yarn, the steam looms of modern times had not existed; the jenny alone could not furnish materials for those weaving giants. Thus, the invention of Hargreaves holds a distinct place in the history of the cotton manufacture, to the progress of which his discoveries were essential. Two grand steps in cotton spinning have now been marked, the invention of the carding machine, by Wyatt, and of the spinning jenny, by Hargreaves; the former preparing the loose cotton for the operation of the latter.

Hargreave's jenny was best adapted for the spinning of the woof thread, viz. the cotton which is shot across the cloth, whilst the machine of Arkwright was better fitted for spinning the *warp* thread, viz., that which runs lengthwise in the material. Thus both inventions work in harmony.

(To be continued.)

FRANK FAIRLEIGH:

OR, OLD COMPANIONS IN NEW SCENES.

BY F. E. S.

CHAP. VI.

THE INVISIBLE GIRL.

On arriving at the inn, to which I was forced to go to order my horse, I perceived Lawless's tandem waiting at the door, surrounded by a crowd of admiring rustics, and Shrimp, his arms folded with an air of non-chalant defiance, which seemed to say, "Oh! run over me by all means if you choose," stationed directly in front of the leader's head. On entering the parlour, I found Lawless busily engaged in pulling on a pair of refractory boots, and looking very hot and red in the face from the exertion.

"How are you, Fairleigh? how are you? That horrid fellow's made 'em too tight for anybody but Tom Thumb, and he hanged to him. Ever read fairy tales, Fairleigh? I did when I was a little shaver, and wore bob-tailed petticoats—all bare legs and bustle—"a Highland lad my love was born;" that style of thing, rather, you know; never believed 'em, though: wasn't to be done even then; eh? Well, this is a puzzler; I shall never get 'em on. Where's the fellow they call Boots? Here, you sir, come and see if you can pull on these confounded nainessakes of yours, and I'll tip you half-a-crown if you succeed; cheaper than breaking one's back, eh?"

"Where are you off to, supposing you ever should get those boots on?" asked I.

"Eh? I'm going to call on the young woman I set alight at the hop last night, and tell her I'm quite down in the mouth about it; explain that I didn't go to do it; that it was quite a mistake, and all owing to the other young woman's being so fresh, in fact; and then offer to rig her out again, start her in new harness from bridle to crupper, all at my own expense, and that will be finishing off the affair handsomely, won't it?"

"I should advise your leaving out that last piece of munificence," replied I, "she might think it an insult."

"An insult, eh? Oh, if she's so proud as all that comes to, I'd better stay away altogether; I shall be safe to put my foot into it there, a good deal faster than I have into these villainous boots—that's it, Sampson, another pull such as that, and the deed's done," added Lawless, patting the human Boots on the back encouragingly.

"I was just going to ride over to inquire after Miss Saville myself," said I.

"That's the very thing then," was the reply. "I'll drive you there instead; it will be better for your scorched fin, (pointing to my injured arm,) than jolting about outside a horse, and you shall tell me what to say as we go along; you seem to understand the sex, as they call the petticoats, better than I do, and can put a fellow up to a few of the right dodges. I only wish they were all horses, and then I flatter myself I should not require any man's advice how to harness, drive, train, or physic them."

"The ladies are infinitely indebted to you," replied I, as I ran up stairs to prepare for our expedition.

A drive of rather less than an hour and a half, during which the thorough-breds performed in a way to delight every lover of horseflesh, brought us to the park gate of Barstone Priory, where Mr. Vernon resided. After winding in and out for some half-mile amongst groups of magnificent forest-trees, their trunks partially concealed by plantations of rare and beautiful shrubs, a sudden turn of the road brought us in front of the priory—an ancient, venerable-looking pile of building, which had evidently, as its name implied, once belonged to some religious community. The alterations it had undergone, in order to adapt it to its present purpose, had been carried out with more taste and skill than are usually met with in such cases. The garden, with its straight terrace-walks, and brilliant flower-beds, contrasted well with the grey stone of which the building was composed, while the smooth-shaven lawn, with an old quaintly carved sun-dial in the centre, and above all, the absence of any living creature whatsoever, imparted an air of severe formality to the scene, which, as the eye rested upon it, seemed to realize all one had read of monastic discipline and seclusion; and one half expected to see a train of dark-velled nuns, or sandalled friars, winding slowly forth from the hall-door. "What a singular old shop!" exclaimed my companion, regarding the structure with a look of displeased criticism; "wretched little windows, as ever I saw; they must be all in the dark inside on a dull day, and every day would be dull if one lived there, I should think. It would puzzle me to tell whether that building was clerical or lay, fish or flesh; a castle that had taken a serious turn, or a church out for the day in plain clothes; how people can like to live in such a mouldy, rusty, musty old barn, that looks as full of ghosts as a cheese is of mites, I can't conceive."

"There certainly is an appearance of gloom and loneliness about the place," replied I; "but I think it is chiefly owing to the absence of any living object—a herd of deer in the park, a group of children and dogs playing on the lawn—anything to give animation to the picture, would be the greatest improvement."

"I should just think it would," returned Lawless. "Fancy a pack of hounds under that jolly old oak yonder, the huntsman and whips in their bits of pink, and a field of about fifty of the right sort of fellows on thorough-breds, dawdling about, talking to one another, or taking a canter over the turf, just to settle themselves in the saddle; that would be a sight to make old Vernon look a little better pleased than he did last night, sing out for his boots and buckskins, and clap his leg over the first four-footed beast that came in his way, even if it should happen to be the old cow."

"I hope I may be there to see if he does," replied I, laughing.

On inquiring whether Mr. Vernon was at home, we were answered in the affirmative by a tall gaunt-looking man-servant, with a stern, not to say surly, countenance, the expression of which was in some degree contradicted by a pair of quick restless little grey eyes, which in any other face one should have said twinkled merrily beneath the large grizzled eyebrows which overshadowed them.

Having, at Lawless's request, procured a nondescript hobbledehoy, of indefinite character, to stand at the horses' heads (we had left Shrimp behind, by common consent, that he might be no restraint on our conversation), he conducted us across the hall into a kind of morning room, fitted up with oak panels, and with a very handsome old carved oak chimney-piece reaching half-way to the ceiling. He was leaving the room to inform his master of our arrival, when Lawless stopped him by saying, "Here, just wait a bit; tell the young woman—that is to say don't tell her anything; but I mean, let Miss Saville be made aware (I see you're awake, for all your long face), put her up to our being here; don't you know, eh?"

"Tip him," whispered I.

"Eh, stop a bit; you're a very honest fellow, and it's right to reward faithful servants; and—you understand all about it, eh?"

One portion of this somewhat incoherent address he did understand, evidently, for without altering a muscle of his face, he put out his hand, took the money, and left the room with the same unconscious air of imperturbability which he had maintained throughout the whole conference.

"Good move that, eh?" exclaimed Lawless, as soon as the door was closed; "that'll fetch her out of her hole, for a guinea. Mind, I shall do my best to cut you out, Master Frank. I don't see why I haven't a right to quite as large a share of her gratitude as you have, for if I hadn't set her on fire, you'd never have put her out; so, in fact, she owes it all to me—don't you see?"

"I'm afraid there's a little sophistry in that argument," replied I; "but we had better wait till we find whether we shall have the opportunity afforded us of trying our powers of fascination, before we quarrel about the effects to be produced by them. I cannot say I feel over sanguine as to the success of your somewhat original negotiation with that raw-boned giant in the blue plush *enée quid none*, as Coleman calls them."

"Time will show," rejoined Lawless, turning towards the door, which opened at this moment to admit Mr. Vernon; and, alas! him only.

His reception of us, though perfectly easy and well-bred, was anything but agreeable or encouraging. He answered our inquiries after Miss Saville's health, by

informing us, cursorily, that no ill effects had ensued from her alarm of the previous evening. He received Lawless's apologies with a calm half-ironical smile, and an assurance that they were not required; and he slightly thanked me for my obliging assistance in words perfectly unexceptionable in themselves, but which, from a peculiarity in the tone of voice more than anything else, impressed one with a sense of insult rather than of compliment. Still, in compliance with certain expressive looks from Lawless, who evidently was most unwilling to be convinced of the failure of his little bit of diplomacy, I used every means I could think of to prolong the visit. I first admired, and then criticised, the carving of the chimney-piece; I dived into a book of prints which lay upon the table, and prosed about mezzo-tint and line engraving, and bored myself, and of course my hearers also, till our powers of endurance were taxed almost beyond their strength; and, at last, having completely exhausted not only my small talk, but my entire stock of conversation of all sorts and sizes, I was regularly beaten to a stand-still, and obliged to take refuge in alternately teasing and caressing a beautiful black and tan setter, who seemed the only member of the party thoroughly sociable, and at his ease.

At length it became apparent even to Lawless himself, that the visit could not be protracted longer, and we accordingly rose and took our leave, our host (I will not call him entertainer, for it would be a complete misnomer) preserving the same tone of cool and imperturbable politeness to the very last. On reaching the hall, we encountered the surly old footman, whose features looked more than ever as if they had been carved out of some very hard species of wood.

"I say, old boy, where's the young lady, eh?" exclaimed Lawless, as soon as he caught sight of him; "she never showed so much as the tip of her nose in the room; how was that, eh?"

"If she com'd into the room when gentlemen was calling, master would eat her without salt," was the reply.

"Which fact you were perfectly aware of when you took my tip so quietly just now?"

"In course I was, why should not I be?"

"Done brown for once, by Jove!" muttered Lawless, as he left the hall—"a raw-boned old rogue, I'll be even with him some day, tho—, we shall see, eh!"

While Lawless was busily engaged in settling some of the harness which had become disarranged, the old footman came up to me and whispered, "Make use of your eyes as you drive through the park, and mayhap you'll spy some *game worth looking after*, young gentleman."

Surprised at this unexpected address, I turned to question him as to its meaning, but in vain; for no sooner had he finished speaking, than he re-entered the hall, and shut the door behind him.

What could he intend me to understand, thought I; he evidently wished to imply something beyond the simple meaning of the words "*game worth looking after*;" could he mean to—no! the thing is impossible—"absurd!" exclaimed I, as a wild idea shot through my brain, and I felt myself colour like a girl.

"What's absurd?" exclaimed Lawless, gathering up the reins as he spoke, "what are you talking about? why, you're ranting and staring about you like a play-actor; what's the matter with you, eh Frank?"

"Nothing," replied I, taking my seat; "don't drive too fast through the park, I want to look at the view as we go along." In obedience to the gaunt domestic's mysterious injunction, I made the best use of my eyes as we retraced our way through the park, and for my pains had the satisfaction of beholding a solitary rabbit, half-hidden under a dock leaf, and sundry carrion crows.

THE EMPERORS.

A SPECTACLE AT ERFURTH.

TOWARDS the close of the year 1808, the Emperors of France and Russia were preceeding from their respective dominions to the North of Germany for the purpose of a mutual interview at Erfurth. Napoleon had felt the difficulty of sustaining the vast plan of partition which he had traced the year before on the Niemen in concert with Alexander, and, apprehensive of the growing discontent and distrust of the other European powers, desired, by his personal influence, to confirm the conditions of Tilsit, or suggest others favourable to his policy. The emergency needed all the genius for which he was renowned to cope with it adequately. On all sides the political aspects of things were menacing. The possession of Spain and Portugal, effected with such a prompt violence, and so calmly concoded in the Articles of the Treaty of Tilsit, was slipping from his hold. England, his steady and omnipresent foe, had cooled his friends and heated his enemies, and cheered on loudly the fury of insurrection in the Peninsula. Aroused by the appeals of its chiefs, and the vehement exhortations of its priesthood, the people—a stirring and unexpected apparition!—suddenly flung itself into the arena of war, in all the simple energy of its cause, before the eyes of Europe, to wrestle for deliverance with the veteran strength of imperial France. The French were assaulted everywhere, and the disaster at Baylen seemed to quench the hopes of Napoleon. Great Britain, by the infraction of a certain article of that code which permits and regulates robbery, murder, and the desecration of human hearths, by honourable and understood acceptance, had seized on the Danish fleet under a storm of bombs; and though, by thus snatching unfairly the weapon about to be aimed against her, she earned much general execration, yet her palpable and dogged resolution to champion the French emperor to the utterance, must have ominously haunted his dreams of ambition. Prussia, bleeding from the late rending away of the goodliest portion of her body politic, was at the same time secretly fostering her *Tugendbund*, yet to be

"made famous by the pen,
And glorious by the sword."

and the muffled tramp of the *Landwehr* might be heard, by the apprehensive listener, within the marches of Austria. All these things were against him, and might well darken the current of his reveries. Nevertheless, while holding his splendid way to Germany, he met the large bodies of his troops proceeding from the Rhine to the Peninsula, with the usual calm courage of his look, and fired them into enthusiasm with one of his spirit-stirring bulletins. And still further, to guard his inscrutable thoughts under a show of unembarrassed state, he ordered a number of the ablest dramatic performers to repair from Paris to Erfurth, for the purpose of representing worthily, in the presence of his Northern ally, the masterpieces of the French stage. The Emperors met, and embraced, with all appearances of the greatest cordiality; and the festivities of that celebrated interview were prolonged for seventeen days. The political objects of both crowned heads were assented to in their many conferences. But the pomp and relaxation of courtly gaiety were alone distinguishable. Napoleon found time to converse with Talma, and rectify the dramatic perceptions of that great actor; to discourse with Goethe, and other literary men of Germany; to hold magnificent reviews, at which the Emperors, in the sight of their troops, would wear the decorations of each other's uniforms; to preside at nightly *reunions* of all that was most enlightened, and beautiful, and chivalrous, in continental Europe; and also to ride with Alexander, surrounded by a dazzling *cortège*, to view the field of Jena, and point out to him the most remarkable localities of

that terrible field, where so many of their subjects had perished in their quarrel, and the rankness of the turf yet witnessed to their eyes how recent and how great had been the carnage. Without any more written bonds of treaty, the arrangements of Tilait were easily ratified at Erfurth, and the fate of the civilized world seemed to hang upon the swords of these two despotic soldiers. They parted with an embrace, as they had met. But they parted on Jena; and the evil omen of that plain was not falsified in future times. The great design which these imperial Titans had striven to consummate was baffled, and brought to confusion. The misery and violence which they calmly determined to visit on the weaker portions of the human family around them recoiled in the end, and soon, upon themselves. The poisoned chalice was bitterly commended to their own lips. And, as it were to point the moral of the great retribution, their own hands were the bloody instruments of their mutual punishment. The campaign of Moscow may serve to show the insincerity of their amicable professions at Erfurth, and the apparent fatality which, as it were, in the order of sequences, pursued their unsanctified schemes. The man who, in 1808, affected to consider the friendship of Napoleon the peculiar gift of Heaven, launched against him in 1812 the bloodiest wapentake of the Russian people, and all the gravest anathemas of religion; while he, in turn, leading the conquerors of Southern Europe to the North, menaced the remotest fortress of the Czar's dominion with the sword. History thus teaches us "how the whirligig of time brings round its revenges."

"What an extraordinary movement," (says a female eyewitness of the scenes enacted in Erfurth, when writing several years later) "existed within the narrow limits of this German village in 1808. The epoch was, indeed, a striking one, in which the astonishing man who for so many years has slept on the rock of St. Helena from the fitful fever of his life, brought together in this place, as with the stroke of an enchanter's wand, emperors, and kings, and the most remarkable of living men. Townspeople and peasants, strangers from all countries, courtiers in costumes richly embroidered, and somewhat ridiculous from the antiquity of their fashion; Polish Jews, statesmen and officers covered with ribbons and crosses, citizen's wives, ladies elegantly dressed, peasant girls, with their baskets on their backs,—all hurried here and there, jostling and labouring to make way. From time to time, French troops, moving with the music of bands to the ground appointed for review, added to the confusion of the streets. The town of Erfurth was not large enough to hold the strangers who came crowding into it. The principal inhabitants were driven from their apartments to those of their servants to make room for the suite of the Emperor of the French. In the streets more removed from the centre, the owners of houses were delighted with the golden harvest afforded by those who tenanted them. The inns were filled to overflowing.

"Napoleon had ordered to Erfurth the principal actors of the Theatre-Francaise—Talma, Mademoiselle Duchenois, Mademoiselle Mars, the beautiful Georges, the charming Bourgoin, appeared several times a-week to play their best parts before an august audience. A little theatre, which had been found in an old college of the Jesuits, had been arranged with extreme promptitude and elegance.

"Box tickets were distributed to native and foreign ladies, for every representation; but it was not easy to obtain them. It was necessary to carry on a long correspondence with our friends in the suite of the Grand Duke of Weimar; and a great deal of intriguing and manoeuvring on their part was necessary, before my friends and myself had the happiness to obtain tickets for a representation of the tragedy of *Edipus*, in which Talma and Mademoiselle Raucourt were to appear.

"We set out from Weimar to Erfurth. On our arrival we deposited our tickets in the inn-chamber which we

had hired, and then tried to get into the streets; but the great throng in them obliged us to make our way back again. We were stupified with horror, on reckoning our tickets, to find that two of them were lost. We removed everything in the room, but in vain—the tickets were gone. The inn-keeper's boy had probably made something of them, for they gave rise to a considerable traffic. Strangers, who arrived at Erfurth without friends or recommendation, often purchased them at a Louis-d'or each.

"If we had but some officers with us!" said one of our youngest female companions; for a soldier with a decoration was as good as a ticket. It was an excellent idea. Among our acquaintances at Erfurth we soon discovered the very cavaliers we wanted; and it was under their protection that we walked to the theatre through the crowd which besieged all the avenues to it. On the top of the stairs we were received by a soldier of the guard, with a terrible face, who disposed us in several boxes in the hall, which as yet was nearly empty.

"I was happy enough to be placed with two of my friends in the front of a box near the stage, whence we could see all that passed in the pit. We congratulated each other on being so well placed; but our joy was of short duration. The boxes near us were filled to excess. The door of ours was opened hastily. The gendarme, or whoever he was, who stood sentinel over our box, came to say that three chairs were too much for three ladies, and immediately introduced to the seats two other ladies, who, fortunately, however, were known to us. All the boxes, as well as ours, were soon full. We were crowded unmercifully, so that we could hardly stir. The heat was enough to make one faint; but really we had not time for anything of the kind. The importance of the grand spectacle which was forming itself under our eyes in the pit, occupied our attention so much, that every inconvenience was forgotten.

"Immediately before the stage were placed arm-chairs for the two Emperors, Alexander and Napoleon; and, at their sides, ordinary chairs for the kings and reigning princes. The space behind these seats began to be filled up. We saw enter the statesmen and generals of the several powers of Europe, men whose names were then famous, and have become a portion of history. Uniforms covered with gold, and an air of vivacity and assurance, distinguished the French from the Germans, more serious and more modest. There were Berthier, Soult, Caulaincourt, Savary, Launes, Duroc, and many others equally celebrated; it seemed as if the greatness of their master was reflected in the aspect of each. Goethe was there, with his calm dignified look, and the venerable Wieland. They had accompanied the Grand Duke of Weimar to Erfurth. The Duke of Gotha, and several German princes, reigning or allied to those reigning, were grouped about the two veterans of German literature.

"A rolling of drums was heard outside. 'It is the Emperor!' ran through the hall in a murmur.

"'Fools! what are you about?' said the commanding officer to the drummers; 'it is but a king!'

"In effect, a German king it was who entered the hall. Three others appeared in a little time after. Without noise or splendour, the Kings of Bavaria, Saxony, and Wurtemberg, entered. The King of Westphalia (Jerome), who came later, eclipsed them by the *éclat* of his embroideries and pearls. The Emperor Alexander, with his majestic port, came next. The grand box, opposite the stage, dazzled all eyes by its brilliancy. The Queen of Westphalia, covered with diamonds, sat in the middle, and near her, the charming Stephanie, Grand Duchess of Baden, more remarkable for the graces of her person than the richness of her dress. Some German princesses were seated near the two reigning princesses. The ladies and gentlemen of their courts occupied the back of the box.

"At this moment Talleyrand made his appearance in

a little box arranged expressly for himself near the stage, on account of the weakness of his legs. The Emperor and the kings remained standing by this box in conversation with the minister, seated comfortably within it. Everybody had arrived; he alone who had summoned all these great people together was still looked for; and he made them wait for some time.

"At last, a fresh rolling of the drums was heard, louder than before, and all eyes were bent on the entrance with an uneasy curiosity. He appeared at last—this most incomprehensible man of an inconceivable era. Dressed very simply, as usual, he slightly saluted the sovereigns present, who had been obliged to wait for him so long, and took his arm-chair on the right of the Emperor of Russia. His short round person was strikingly contrasted with the superb figure of Alexander. The four kings took their places on chairs without arms, and the play began. But Talma displayed his excellent art in vain. Jocaste-Raucourt, whose beauty and talents had fascinated Baron Grimm, at Paris, during half a century, now found that she could charm no more. We had no eyes or attention for anything but the pit before us. In the meantime, the gendarmes at the door of our box did all they could to correct the deficiencies of our education, and to teach us, in the intervals between the acts, the etiquette to be observed towards the master of the world. 'Take down that opera-glass—the Emperor does not like it!' cried one of them, leaning over the ladies seated behind us. 'Sit up, and don't stretch out your neck—the Emperor does not like it!' cried another. The impertinence, to be sure, was very great; but we took pattern by the kings and princes before us, and bore patiently at the hands of Frenchmen what we could not remedy.

"Immediately after the opening of the tragedy, which he had already seen a hundred times, Napoleon sat himself at ease in his arm-chair, and was soon sound asleep. It is well known that he could sleep at any hour of the day or night he pleased. Eye-witnesses have declared that, even on days of battle, he would designedly set himself to sleep during an hour or two, for the purpose of recruiting his strength, and wake at a fixed time. On the day of this representation at Erfurth he had fatigued himself in reviewing the troops for several hours together. It was a singular spectacle for us to see, buried in such a quiet sleep, this terrible man, whose vast plans involved one half the globe, either for good or evil. We were never tired of contemplating, with an astonishment mingled with fear, that fine antique profile relieved against the sombre uniform of the Czar Alexander.

"Twenty years have passed away since then. This is hardly the third of human life, and yet how many changes have been wrought in that space of time! What a mighty impetus has the world received in this fifth of a century! No human heart could then guess half what has since come to pass. Time has reaped a plentiful harvest. The kings who filled the hall at Erfurth are gone; and he, who had called them together, sleeps in a lonely isle washed by the waters of the ocean! The short and brilliant life of Alexander is over; and the Kings of Saxony, Bavaria, and Wurtemberg, sleep in their marble tombs! King Jerome only survives; but his renown has vanished, with his fantastic royalty, like a vision of the morning. The Grand Duchess of Baden, the beautiful Stephanie, has long deplored her husband, lost in the flower of his age. The Duke of Gotha is dead, and his race is extinct with him. The Duke of Weimar lives only in the remembrance of his own family."

Since Madame Schopenhauer wrote the foregoing reminiscences, the change, on which she moralizes, has itself undergone change. Napoleon's resting-place, as well as himself, has been removed. A fate and a term have been given to the very sepulchres of men. The wishes of the Emperor, that his ashes should repose amidst the beloved people he had so affectionately de-

cimated, were not breathed in vain—thanks to the "three days and old muskets" of 1830, which swept away, like a withered fruit from a rotten branch, what the kings of Europe had wasted and distracted human nature for twenty-five years to establish. Napoleon lies under the dome of "The Invalids," with all his dynasty in his coffin. For Fate—the power to which he so fondly confided the fortunes of his house—

"Had placed a barren sceptre in his gripe,
Thence to be wrenched with an unlineal hand."

And in this transference of his bones from St. Helena to Paris, it would seem that the historic picturesque, that flung its shadows over the close of Napoleon's career, has been somewhat effaced. The moral of his life appears to be less emphatic, and the antithesis of his fortunes to lose half its eloquence and poetry. It would have better suited the rounding of the great drama, to leave him shrouded in his military cloak, under his willow, in the lonely isle.

However we may think on the matter, one thing is pretty certain, that the days are gone by, when such men as Napoleon could overawe Civilization

"With the majestic menace of their eyes,"

or establish Empire with the sword. The old royal roads to glory, let us hope, will soon be closed up, with the grass growing on them: and, surely, the human family will find itself infinitely better and happier for the change.

OLD RECORDS OF NEW ROADS.

No. IV.

THE line of railway from Wimbledon to Brighton passes over Coombe Lane, and crosses the road from Malden to Richmond Park; and there, at the extremity of an avenue, stands Coombe House, now the property of Lord Liverpool, though formerly (under the designation of Hiacomb Place) it was one of the many residences of Richard Beauchamp, aptly designated the great Earl of Warwick, and well delineated by Sir E. L. Bulwer as the last of the Barons.

From the moment of his birth, the history of that extraordinary man seems identified with that of the kings of England who were his contemporaries—for Richard the Second held him as his sponsor at the baptismal font (1381). He first entered on his brilliant career of arms at a tournament held in honour of the Coronation of Jane of Navarre, consort of Henry IV., when in his twenty-eighth year he held the jousts on the part of her Majesty against all comers, and "therein behaved himself nobly." His subsequent deeds of valour are blazoned on the page of English History, where he appears as the hero of the Lancastrian wars. But some of his less chivalrous enterprises, in his earlier years, are less generally known, and are highly characteristic of the age in which he lived.

Having greatly distinguished himself as the antagonist of Hotspur and Douglas, on the field of Shrewsbury, he was made a Knight of the Garter, as a reward for his services. Having obtained leave from King Henry IV. to pay his vows at the Holy Sepulchre, he first visited his kinsman the Duke de Barr, at Calais, where he was nobly entertained for the space of eight days, and being "full lovingly and worshipfully refreshed," he proceeded to Paris, accompanied by the Duke.

The King of France, it being Whit-Sunday, sat publicly at the Banquet, crowned, and otherwise regally attired, and, on the entrance of this far-famed English knight, he, in courtesy, invited him to sit at his own table, where the Earl "so famously behaved himself in language and manner, that the king and his lords, and all other people gave him great laud at his departure." Charles evinced his high esteem of the noble

qualities of his guest by appointing a herald to conduct him safely through the realm.

New honours awaited the earl in Lombardy. A second herald, despatched to meet him, presented a letter from Sir Randolph Mallacet, challenging him to perform certain feats of arms, for the Order of the Garter, before Sir Count Galeot, of Mantua.

Warwick gladly embraced this opportunity of upholding his country's glory, and that of the honourable Order which his Sovereign had conferred upon him, but restrained his martial ardour till after the performance of a pilgrimage to Rome, whence he repaired to Verona, where the rumour of the tilt had drawn together an immense multitude, anxious to behold this popular exercise. Warwick agreed to fight with axes after the joust, then with arming swords, and lastly with sharp daggers. Sir Randolph entered the field with nine spears borne before him. In the first encounter neither party sustained defeat, but in the attack with axes Warwick wounded his opponent severely in the shoulder, and the Italian would have been utterly slain had not Sir Galeot cried peace! The fame of this exploit travelled before the Earl to Venice, where the Doge and his nobles vied with each other in acts of courtesy towards the accomplished English Knight, whom they loaded with valuable presents. In Asia, at that period the emporium of arms and arts, the illustrious pilgrim was treated with the deference due to his rank and talents. The Patriarch's deputy met him with much respect, and Warwick having made his offerings at the Holy Shrine, he placed his armorial bearings upon the north side of the temple, where they were recognized many years afterwards by divers pilgrims who came from thence.

But the homage paid to Beauchamp at Jerusalem was not confined to Christians. The Lieutenant of the Soldan—designated as "Sir Baltredam," in the old Chronicle, having heard that the Earl was a descendant of the famous "Sir Guy of Warwick," whose history the natives possessed in their own language, invited to his palace the youthful knight who boasted of so renowned an ancestor. There, after having feasted the Earl royally, he presented him with three precious stones of great value, besides various silks and cloths of gold and guerdons to his servants. But the most undisputed incident in the historian's narrative of this visit, and the one related with equal gravity and simplicity is—that in the hour of social intercourse the supposed infidel confessed his belief in the Christian religion, in proof of which he rehearsed the creed, at the same time acknowledging his dread of the punishment which would attend the discovery of his real faith. A modern author has asserted that many of the Roman Catholic priesthood in Spain are at this day unconverted Jews. When will the hypocrisy and inconsistency of man come to an end?

The Earl of Warwick, in return for the civilities he received from "Sir Baltredam," gave a banquet to his servants, sending them away with rich gifts of scarlet and other English cloths, which so delighted the Paynim Knight, that he again visited the Earl, and declared he would wear his livery, and be Marshal of his Hall. Whereupon Warwick, who was never outdone in courtesy, presented him with "a Gown of *Blackejurke* (query?), furred; after which they had much discourse together, he, Sir Baltredam, being skilled in sundry languages."

From Jerusalem, Beauchamp returned to Venice, where he was again received with distinguished honours, and from that city he travelled into Russia, Lithuania, Poland, Prussia, Westphalia, and many parts of Germany, in most of which countries he achieved great feats of valour in "divers tournaments." Nor was his own sovereign slow in rewarding his acknowledged merit. On Warwick's return to his native land, Henry IV. appointed him by an esquirel indenture, "retainer to serve the Prince of Wales (then in his 22d year) as

well in peace as in war, both in the realms of England and upon and beyond the seas," for which service he was to receive the sum of two hundred and fifty marks annually; and it was likewise stipulated that when "he should be in the Court of the said prince, he should be allowed the attendance of four esquires and six grooms, and diet for them all; provided that the said prince should have a third of his spoils in war, and a third of the thirds obtained by those who fought under his banners. Also, if he should capture any great commander, fort, or castle, they were to be delivered up to the said prince, upon a reasonable satisfaction for the same."

In the service of the prince, the conditions of which appear strange to us moderns, it appears that Warwick obtained the confidence of his Highness so entirely that when he was called to the throne, Henry V. appointed the earl High-Steward of England, for the coronation of his coronation (1413); specifying in the patent of his appointment, that he had so selected Richard Beauchamp "for his wisdom and industry."

Two years afterwards (1415) the earl attended the congress held at Constance, where he was accompanied by the Bishops of Salisbury, Coventry and Lichfield, Bath and Wells, Norwich, Hereford, and St. David's, the Abbot of Westminster, the Prior of Worcester, and several other learned persons, not forgetting a train of eight hundred horsemen.

There the fame of the earl's bravery "rang throughout the Christian world;" and during the Congress he received a challenge from an Italian nobleman "to tilt for his lady's sake." Warwick slew his adversary, an exploit which, it appears, was highly gratifying to the empress, who witnessed the sanguinary deed, as "charmed with the earl's superior skill and bravery, she took his cognizance of the bear from the shoulder of one of his knights, with the intention of wearing it herself for great favour." Upon which Warwick ordered the badge so honoured to be made of "pearls and precious stones;" which he presented, on his knees, to his imperial patroness. In return the emperor gave him his own sword to bear, with the most flattering expressions of esteem. As a further mark of honour, Sigismund offered to send by his hands a most precious relic to the King of England, namely, the heart of Saint George: a commission Warwick gratefully undertook, but, on hearing afterwards that the emperor intended to visit England in person, he restored the gift to him, saying, "with his usual grace," that the delivery thereof, by his own hands, would be more acceptable.

Sigismund soon after offered the holy heart in the chapel at Windsor, as a Knight of the Garter, being then invested with that order. On his journey to and from England, the emperor passed through Calais, of which Warwick was then Governor, and there his Imperial Majesty was so splendidly entertained, that he told the English King "that no Christian prince had such another knight for wisdom, nurture, and manhood," and ever after, by the emperor's authority, Beauchamp was styled "the father of courtesie."

The account given by Rous, of a tournament held by the earl during his sojourn at Calais, is highly illustrative of the manners of that day. He had three pavices (or shields) painted; the first represented a lady "harping at the end of a bedstead, with a grette of gold on her left sleeve;" and her knight, called the Green Knight, published a letter sealed with his arms, (black quarter field argent,) offering to joust with any knight of France: twelve crowns and two shields should be provided.

The device on the second pavice was a lady sitting at a board working pearls, and on her sleeve was attached a glove of plate (silver). Her knight was called Chivalier Best, his letter was sealed with his arms, two harts gules on a field argent. He challenged fifteen courses; and two saddles of charges should be provided.

The third pavice represented a lady sitting in a garden making a chaplet, and on her sleeve was a "poleyn"

with a river. Her knight was called "Chevalier Atendant;" his challenge was to run one course with sharp spears, without spurs. His letter was sealed gold and gules quartered, and border verd.

These missions were sent to Charles VI. and his Court, and duly accepted by three French knights, who assembled on a lawn without the gates of Calais, called the "Park Hodge of Guynes." On the appointed day, Warwick, as the Green Knight, entered the lists on a superb courser, trapped with the armorial bearings of one of his ancestors. On his helmet he bore a large plume (or "bush") of ostrich feathers, and his vizor closed. At the third course he cast his antagonist (Chevalier Ronge) down to the ground at his spear's point, behind his horse's tail, and being proclaimed victor, he rode to his pavilion; still maintaining his incognito, and forthwith sent a fair courser to the discomfited knight.

The next day the gallant earl appeared again on the field, as "Chevalier Verd," his vizor still closed, and ostrich feathers on his basket, which was further graced with a chaplet, and his horse trapped with the two bars gules on a field argent. He encountered Sir Hugh de Lawney, as "Chevalier Blanc," and, having smote him on his vizor twice, and broke his harness, he was again declared victor, and again returned to his pavilion unknown, from whence, as before, he sent a charger to his foe.

On the third day Warwick rode to the course with his face uncovered, and his name and rank proclaimed. The chaplet he had worn on his basket the preceding day, was now enriched with pearls and precious stones, and his herald announced that, like as he had in his own person performed on the two previous days, so would he now, and the boast was fulfilled. His antagonist was Sir Coland Fynes, and at every stroke of Warwick's spear he bowed him to his horse's back. The Frenchman, being unable to bend the earl from his seat, exclaimed, "that he was bound to the saddle;" an accusation instantly refuted by the earl's springing from his horse, and remounting with equal ease. Again victor, he rode to his pavilion amidst the acclamations of the crowd; and having despatched a third horse to Sir Coland, and feasted the spectators still more sumptuously than on the two preceding days, he sent rich gifts to the three vanquished knights, and "rode, with great worship," back to Calais.

Such were the chivalrous feats of Richard Beauchamp, Earl of Warwick. His subsequent deeds in the Lancastrian wars, need no mention here; whilst of his private character Hume remarks, "that his personal qualities enhanced the splendour of his nobility. He was not more distinguished by his gallantry in the field than by the hospitality of his table, the magnificence, and still more the generosity of his expenses, and the spirited and bold manner which characterized all his actions. His undesigning frankness and openness rendered his conquest over men's affections the more certain and infallible. His presents were regarded as sure testimonies of esteem and friendship; and his professions as the overflowings of his genuine sentiments." No less than thirty thousand persons are said to have daily lived at his board in the different manors and castles which he possessed in England; and How asserts that, at the Earl of Warwick's house, in London, there were often six oxen eaten at a breakfast; "and every tavern was full of his meate, for he that had any acquaintance in that house might have there, so much of sodden and roaste meate as he could pricke and carry upon a long dagger."

In comparison of this profusion the entertainments of Burleigh appear insignificant, and yet Holinshed, who wrote in the reign of Elizabeth, gives a different notion of the boasted magnificence of earlier times. "There are old men," says he, "yet dwelling in the village where I remain, which have noted three things to be marvellously altered in England within their memory.

One is the multitudes of chimneys lately erected; whereas in their young days there were not above two or three, if so many, in most uplandish towns of the realme; the religious houses and manor places of their lords always exysted, and, peradventure, some great personage. But each made his fire against a veredosse in the hall, where he dined and dressed his meat. The second is the great amendment of lodging; for, (said they) our fathers, and we ourselves, have lain full oft upon straw pallettes, covered only with a sheet under coverlets made of dayswaine or hop harlots, and a good round log under their head instead of a bolster. If it were so that the father, or the good man of the house, had a mattress or flock-bed, and thereto a sack of chaff to rest his head upon, he thought himself to be as well lodged as the lord of the town. As for servants, if they had a sheet above them it was well; for seldom had they any under their bodies to keep them from the pricking straws that ran oft through the canvas and rased their hardened hides. The third thing they tell of is, the exchange of treene (wooden) platters into pewter, and wooden spoons into silver or tin."

Even in the days when Holinshed wrote this tirade against the progress of luxury, the floors of the best apartments were generally strewn with rushes; then carpets, couches, fauteuils, and footstools were alike unknown, though many instances occur of bedsteads with their hangings being (in times even previous to Holinshed) made heir looms, or given in special dowry, and even made subjects of litigation amongst the aristocracy of England. About a century after Holinshed wrote, household furniture became, under the auspices of "Louis le Grand," a matter of such importance, that a certain style of decoration used in "Le Siècle de Louis XIV." is still known by the name of that monarch; and in the infancy of George IV., his bed, as Prince of Wales, was hung with "very rich rose-coloured satin, and the furniture of the room was of the same colour, beautifully trimmed. His highness sleeps upon four mattresses, the upper of which is covered with white satin; the bolster and pillows are of the same quality."

In Henry VIII.'s time an edict was published, minutely describing the order for making the king's bed nightly by certain yeomen of the guard, who might be aptly termed yeomen prickers, as their chief charge appears to have been to certify that no offensive or dangerous weapon was concealed in his majesty's mattress or bed-clothes, for which they were to be repaid nightly by a manchet and cup of ale. Still, with this precedent before his eyes, the worthy chronicler of Elizabeth's days would scarcely have credited the rapid growth of domestic luxuries, even had the vision of a modern drawing-room been vouchsafed to him. What might his reflections in that case have been when even in his own times he says, "When our houses were builded of willow, then had we oaken men. But now that our houses are made of oak our men are not become willow, but a great many altogether of straw, which is a sore alteration. In those days the courage of the owner was a sufficient defence to keep the house in safety. But now the assurance of the timber must defend the men from robbing."

Holinshed is not the only splenetic writer who condemns his contemporaries, and upholds their ancestors. It is problematical whether even the valour of that "man of oak," Richard Beauchamp, would have satisfied him had he lived in his day, though it made him, as an ancient writer calls him, "the setter up and puller down of kings;" and as such the Earl of Warwick could not have chosen a more appropriate residence than Kingston, which owes its name to the circumstance of its market-place having been selected for the coronation of many of the first Saxon Kings, as also for that of Egbert, son of Alfred the Great.

There are but few historical reminiscences attached to Kingston. A few years before the death of Henry III., (1264) during the wars with his barons, he marched

out of London, and took the castle of Kingston, then belonging to Gilbert Clare, Earl of Gloster, which he entirely demolished; and in the civil wars of Charles I. Kingston was distinguished for its loyalty, as the first armed force that declared for the king was said to have been there assembled; and there the last struggle in behalf of the royal cause was made. When Catherine of Arragon came to England, to espouse Charles II., she lodged at Kingston the night before she arrived at "Kennington Palace." But it does not seem to be further noticed in history.

Nevertheless, by a strange coincidence, Kingston, or as Camden calls it, "the King's Towne," was one of the few places noted for the celebration of the Kyngham, an annual game or sport, conducted by the parish officers, who paid the expenses, and accounted for the profits of it. It was something similar to the May games, but held later in the summer, and the performers went from house to house levying contributions, and dressed in a sort of masque, of which the principal characters were Robin Hood, Maid Marian, Little John, a friar, a lady, and several "Moors" or morrice dancers.

In the reign of Henry VIII. this game was so much the fashion at Court, that the king and his nobles would sometimes appear in disguise as Robin Hood and his men, "drest in Kendal, with hoods and hosen." In these days, when the schoolmaster is so much abroad, it is almost superfluous to observe that Marian was the name assumed by the beloved mistress of Robert, Earl of Huntingdon; who followed him while he was in a state of outlawry, during which time he was the original Robin Hood, the favourite hero of the earliest English ballads. The real story of Lord Huntingdon and his fair Marian is chronicled in the old poem of the "Nut-browne Mayde," supposed to be written (1400) in the reign of Henry IV., and subsequently paraphrased by Prior in that of Queen Anne.

Kingston is also celebrated for having been the first place of which Nicholas West was vicar, in the reign of Henry VIII. This celebrated man was the son of a baker at Putney, where he was born, and having distinguished himself at the grammar school there (1483) he was chosen a Scholar of King's College, Cambridge, in the year of Edward IV.'s accession. There he gave little promise of future eminence, as, in the words of Fuller, "he was a rakehell in grain." One of his vicious pranks was setting fire to the provost's lodgings, for which he was expelled the university; but having seasonably become reformed in his conduct, he was subsequently re-admitted, and betaking himself to hard study he became an eminent scholar, and, as his first preferment, obtained the vicarage of Kingston-upon-Thames.

How often do we see that the locality in which a man chances to enter upon public life mainly influences his future fortunes. It happened that the two favourite palaces of Henry VIII., namely, Richmond and Nonsuch, were in the immediate vicinity of Kingston, whilst, at the same time, Wolsey himself, the model of courtiers, at once the envy and the warning of the ambitious, resided at Hampton Court. Whether the precepts and example of Wolsey taught him the way to royal favour, or whether West's acknowledged talents first recommended him to Henry's notice, is uncertain; perhaps the accidental circumstance of neighbourhood may have contributed more than either to the rapid advancement of the baker's son; for conversational talent and wit have always been tickets of admission to the tables of the great, and as the college irregularities of the vicar were not uncongenial to the taste of the profligate monarch, his eminent learning and extraordinary abilities as a politician made him doubly acceptable as a companion, when majesty sought, in the retirement of the country, relaxation from the cares of royalty. Had West's first preferment been in Westmoreland, instead of Kingston-upon-Thames, he possibly would never have risen so rapidly in the favour of Henry; who, after bestowing on him several other benefices, made him

Bishop of Ely, employed him in various embassies, and lastly, Queen Catherine chose him as her advocate in conjunction with Bishop Fuller.

The style of living adopted by this favourite of fortune was magnificent, that he is said to have kept in his house a hundred servants, to fifty of whom he gave four marks wages, and to the others forty shillings a-year, allowing every one of them four yards of cloth for his winter livery, and three and a half yards for his summer livery. He died in the same year as Edward VI. (1553) and is buried in Ely Cathedral, having lived to see no less than six monarchs in succession occupy the British throne; whilst the changes in the political world, and still more, the reformation in the religion of the state, were equally remarkable events, occurring during the extraordinary career of this quondam vicar of Kingston-upon-Thames.

THE FEAST OF THE ROSE.

THE ancient custom of the Feast of the Rose has been attributed for many ages past to St. Medard, Bishop of Noyon, who lived in the 15th century, in the time of Clovis. This good bishop, who was at the time Grand Master of Salency, a village half a league from Noyon, in the south of France, after passing many of his years of early life in endeavouring to do all the good possible, so that he was beloved by all the neighbourhood—after many years' consideration, he at last made up his mind to present, on every New Year's Day, a sum of twenty livres and a chaplet of roses, to the lass of the village who was held in the highest estimation, and of the most virtuous reputation. It is said that, he presented this glorious prize to his youngest sister, who was proclaimed by the public voice as the Village Rose. He is seen on the steps of the porch of the chapel of St. Medard, situated at the extremity of the village of Salency, dressed in his pontifical robes, placing the chaplet of roses on the head of a villager, who is dressed in a plain white dress, with only a scull cap of black velvet on her head, and her hair reaching to her knees.

The villagers of Salency soon found it to their benefit to try and be the Village Rose for the year. The young men, it was soon seen, always chose those who had held that honour in preference to the others. St. Medard, struck with these advantages, founded his yearly gift by letting off to tenants twelve acres of ground attached to his estate, which paid the yearly rent of twenty pounds and all incidental expenses of the ceremony of the *fête*. The present Lord of Salency enjoys to this day the choice of the Rose of the Village.

The 8th of June is the day on which the *fête* of St. Medard is held. About two o'clock in the day, the village lass, clothed in white, her hair floating loosely on her shoulders, accompanied by her family and twelve young lasses, also dressed in white, with a broad blue ribbon or shoulder knot, arm in arm with twelve young men of the village, march to the chateau of Valency to the sound of tambourines, violins, bagpipes, &c. The lord and lady of the manor come out to meet them, and she then makes a neat speech, in which she returns her thanks for the honour and preference he has bestowed on her; then, following his lordship or his representative, giving each an arm, is preceded by the music, followed by a number of persons, who entering the chapel proceed to the choir, attend vespers, and sing hymns in chorus. The vespers being finished, the clergy and people form a procession, and adjourn to the chapel of St. Medard; the Curate then blesses the crown and wreath of roses, which is on the altar table. The chaplet is entwined with a light blue ribbon, edged on the under side with a silver band. After the Benediction, and a discourse analogous to the subject, the officiating priest places the crown on the head of the Rose of the Village, who is on her knees, and receives

twenty pounds in a small velvet purse, in the presence of the lord of the manor, and the officers of justice.

The Rose of the Village, now crowned, is led by the lord of the manor, or his bailiffs, and the whole of the assembly, to the parish church, where they chaunt an ancient *Te Deum* of St. Medard to the sound of musquetry by the troops and young men of the village. On leaving the church, the lord of the manor, or his representative, leads the Rose of the Village to the middle of the great street of Valency, where the house steward of the lord had spread a large table furnished with six plates, six knives and forks, two bottles of claret, two metal pinks, two glasses, two water bottles, two white loaves, one brown one, and a small cheese. The assembly then cheer the Rose, and do her homage by presenting her a small silver arrow, two balls, a small silver whistle, which she is to blow three times at the house of the lord of the manor before she will accept any offer of marriage from the villagers. The house-steward then pays the attendants for their assistance that day, thirty sous, or 2s. 6d. each.

After this the assembly of villagers adjourn to the court of the chateau, under a large tree, where the lord of the manor leads off the dance with the Rose of the Village; after that the dancing becomes general among the villagers, to the sound of rustic music. The *bal champêtre* is always stopped at the setting of the sun. The Rose of the Village, on the day after, at midday, invites all the lasses of her acquaintance to a collation, followed by dancing, or other games, as may be.

This is the origin of the Feast of the Rose; it is no less interesting when it is affirmed that throughout the numerous villages in France where the *fête* is held, riotous meetings, drunkenness, debauchery of any kind is never known, and that the honour of receiving a chaplet of roses at Salency had excited an emulation in all the surrounding villages in the various departments to be present at the meeting, to see the Rose of the Village presented with the order of Merit and Virtue.

Louis XIII. being on a visit at the chateau of Varennes, a small village near Salency, M. de Belloi, the lord of the manor, begged of that monarch to present a gift to the village lass who was considered the most virtuous. Louis XIII. consented, and requested M. le Marquis de Garde, his colonel of the guards, to be present at the next Rose Meeting, and to order the chaplet, the purse of gold, and the blue ribbon, which were presented with all due formality that year, and have been ever since through the government. It is authenticated in the royal records of France.

Miscellaneous.

THE Mahomedans are particularly proud of their acquirements, and suppose themselves possessed of great imaginative powers. They are surprising egotists, and, like the Spaniards, poor and proud to a proverb. A short time since, a Moonshee was domesticated with us, who afforded a curious example of this union of unfortunate qualities.

Abdool Kureem had neither lodging, nor wherewithal to satisfy the cravings of a Persian appetite: but, like all his class, his manners were pleasing and mild, which won for him our commiseration. He accompanied us from the Presidency, and although a professional Moonshee, he was soon discovered to be grossly ignorant of even the construction of his native language. His leisure was devoted to inditing verses, which, execrable as they were, he imagined equal to Ferdousi's: such was our poor poetaster's opinion of his own talents, that whenever any of his Mahomedan friends came to visit him, in lieu of conversation, he commenced by drawing out a long roll of closely written paper, and spouting his own verses, constantly pausing to ejaculate expressions eulogistic of his genius, which were courteously re-

echoed by the deep-drawn Bismillah of the listening coterie. The prose of Abdool was as highly inflated as his poetic style; he delighted in the most flowery and wordy pomp of the Persian school. The following note, written by him, and translated by a Hindoo, is an amusing specimen of the unavoidable bathos, inseparable from this style of composition. It may be prefaced, that Abdool had been requested, during his morning walk, to inquire what time would be desirable for our gardener to send for some shrubs, promised us by a native, as transplants from his parterre. Some circumstance preventing his return at the time proposed, we received this specimen of epistolary grace. "As long as the garden of the world is adorned with tender cypresses, statues of beautiful mistresses, and roses which are the cheeks of beloved ladies, so long may the garden of wishes, which belong to the great Captain, (may his prosperity be perpetual!) who is a bud of the tree of chiefship, and a sprout of that of greatness, be flourishing and green by the watering of Divine goodness. Your servant, (i. e. I,) after presenting the nosegay of his solicitous prayer to God for your advantage, which is gathered by the hand of well-wishing and sincerity, and united with the threads of those prayers which are performed at dawn and midnight, wishes, that your sacred mind may know, that when your servant (i. e. I) requested from Gopal Joesee, son of Radha Joesee, the plants of Neem, which he agreed to give yesterday; he answered, that to-morrow, at noon, when the gun fires, you may send your servant to his garden, and he will give the plants which are required.

"(Signed) ABDOL KUREEM,

"Moonshee of Shiraz."

The beauty of a Mahomedan letter consists in the length of the exordium, the number of similes, and the paucity of facts introduced. As Abdool Kureem was long with us, I endeavoured to teach him English, with the hope of increasing his capabilities as a tutor. His memory proved so defective, that I eventually abandoned my task in despair. The reading-book selected was a collection of easy fables, chosen with the hope of the style attracting him, from its resemblance to that of his own authors. The first tale concerned the sapient doings of a learned cat, which he read, and re-read, for a considerably longer period than could have been required for the composition of the volume, and, moreover, the whole was explained to him in the purest Persian. At length I ventured to ask, if my pupil comprehended the fable. "No." Did he at least understand the meaning of the word *Cat*, about which so much had been studied? The answer was appalling. "Kat!" replied the poet, with the puzzled look of one hopelessly plunged in a sea of doubt; "Kat? Allah Kureem! God is merciful, but by the beard of my father, your servant cannot tell the meaning of Kat." From this period I left Abdool to the manufacture of verses, to the enjoyment of a remarkable appetite, and to his favourite meditations on the probable locality of the "fountain of life," in which he as firmly believed, as in the philosopher's stone, and the hours of Paradise.—"*Western India in 1838*," by Mrs. Postans.

CURIOSITIES OF SCIENCE.

LE VERRIER'S NEW PLANET.

"In the whole history of Astronomy—I had almost said, in the whole history of Science," writes Professor Airy, "there is nothing comparable to the circumstances attending the discovery of the planet exterior to Uranus. The history of the discoveries of new planets in the latter part of the last century, and in the

present century, offers nothing analogous to it. Uranus, Ceres, and Pallas, were discovered in the course of researches which did not contemplate the discovery of planets. Juno and Vesta were discovered in following up a series of observations suggested by a theory which, fruitful as it has been, we may almost venture to call fanciful. Astræa was found, in the course of a well-conducted examination of the heavens, apparently con-

templating the discovery of a new planet, as only one of many possible results. But the motions of Uranus, examined by philosophers who were fully impressed with the universality of the law of gravitation, have long exhibited the effects of some disturbing body: mathematicians have at length ventured on the task of ascertaining where such a body could be; they have pointed out that the supposition of a disturbing body, moving in a certain orbit, precisely indicated by them, would entirely explain the observed disturbances of Uranus; they have expressed their conviction, with a firmness which I must characterise as wonderful, that the disturbing planet would be found exactly in a certain spot, and presenting exactly a certain appearance; and in that spot, and with that appearance, the planet has been found. Nothing in the whole history of Astronomy can be compared to this.—*Proceedings of the Royal Astronomical Society.*

WHAT WERE THE HABITS OF THE DODO?

ALL the records we have of the history of this remarkable extinct bird are to be found in the reduced highly-finished figure by Lavery, in his famous painting of "Orpheus Charming the Beasts," now in the collection at the Hague; in the recent discovery of the skull of the bird, in the Museum of Natural History at Copenhagen; and by a comparison of the cast of the head of the bird, in the Ashmolean Museum at Oxford, with those of other recent and extinct species of birds. Added to this, is some satisfactory evidence from a comparison of the bones of the foot, which have recently been very skillfully and judiciously illustrated by the able curator of the Ashmolean Museum. Upon the whole, Professor Owen considers the structure of the foot, and general form of the beak, to lead us to regard the Dodo as a modified bird of prey. Unable to fly, it could have had small chance of obtaining food by preying upon members of its own class; and, if it did not exclusively subsist on dead and decaying organized matter, it most probably restricted its attacks to reptiles, certain fishes, crustacea, &c. Possibly, a search for the bones in the superficial deposits, the beds of rivers, and the caves in the islands of Mauritius and Rodrigues, may enable naturalists further to illustrate the history of this curious bird.

TRAVELS OF VOLCANIC DUST.

On the 2d of September, 1845, a quantity of volcanic dust fell in the Orkney Islands, which was supposed to have originated in an eruption of Hecla, in Iceland: it has now been fully ascertained that an eruption of that volcano took place on the morning of September 2d, about nine o'clock, so as to leave no doubt of the justness of the conclusion. The dust had thus travelled about 600 miles!

ELECTRICITY OF GUN COTTON.

MR. BOWMAN, Demonstrator of Chemistry at King's College, has ascertained "gun cotton" to be capable of application to a purpose different from any hitherto described; viz. that of insulating an electrically charged body. Mr. Bowman, while unravelling some cotton which had matted together while in the acid, was struck with the tenacity with which it adhered to his fingers; and, on lightly holding a small flock of it, and approaching a finger of the other hand, or any foreign body, found that it was strongly attracted towards it; thus differing essentially from the unprepared cotton. By examining the two balls at short intervals of time, by means of a delicate gold-leaf electrometer, Mr. Bowman found that the one suspended by the cotton retained its charge considerably longer than the other; thus proving the cotton to be a more perfect insulator than the silk, which has hitherto been chosen as best adapted for the purpose of insulation. The acid employed was a mixture of equal parts of nitric acid, sp. gr. 1.46, and sulphuric acid, gr. 1.83, and the cotton was immersed

for about five minutes. It was not highly explosive, detonated only when partially struck with a hammer, and required to be heated considerably to cause it to explode. Mr. Richard Phillips, one of the editors of the *Philosophical Magazine*, in agreement with the above statement, mentions that Mr. Reeks, of the Museum of Economic Geology, when drying some gun cotton, and drawing it out, heard a crackling noise, which induced him to present it to the gold-leaf electrometer, when it instantly caused strong divergence of the leaves.

PURITY OF ANCIENT COINS.

SILVER coins, after having been long in the earth, are often found covered with a salt of copper. This may be explained by supposing that the alloy of copper, at the surface of the coin, enters into combination with the carbonic acid of the soil, and being thus removed, its place is supplied by a diffusion from within; and in this way, it is not improbable that a considerable portion of the alloy may be exhausted in process of time, and the purity of the coin be considerably increased.—*Professor Henry, U. S.*

THE GEOLOGY OF NORWAY, AS CONNECTED WITH THE ABSENCE OF A FEUDAL NOBILITY.

A PHYSICAL circumstance, almost peculiar to Norway, and apparently very little connected with the social state of a people, was of great influence, in concurrence with accidental circumstances, in preventing the rise of an aristocracy. The stone of Norway is gneiss, or other hard primary rock, which is worked with difficulty, and breaks up in rough, shapeless lumps, or in thin schistose plates; so that walls cannot be constructed of such building materials without great labour, time, and command of cement. Limestone is not found in abundance in Norway, and is rare in situations in which it can be easily transported; and even clay, which is used as a bedding or cement in some countries for rough lumps of stone in thick walls, is scarce in Norway. Wood has, of necessity, in all times and with all classes, been the only building material. This circumstance has been of great influence in the middle ages on the social condition of the Northmen. Castles of nobles or kings, commanding the country round, and secure from sudden assault by the strength of the building, could not be constructed, and never existed, in Norway. The huge fragments and ruins of baronial castles and strongholds, so characteristic of the state of society in the middle ages in the feudal countries of Europe, and so ornamental in the landscape, are now wanting in Norway. The noble had nothing to fall back upon but his warship; the king nothing but the support of the people.—*The Sea-Kings of Norway; by G. Laing.*

GOLD IN SIBERIA.

THE reign of the Emperor Nicholas has been distinguished by the important discovery, that portions of the great eastern regions of Siberia are highly auriferous, viz. in the government of Tomsk and Teniseik, where low ridges, similarly constructed to those on the eastern flank of the Ural, and, like them, trenching from north to south, appear as offsets from the great east and west chain of the Altai, which separates Siberia from China; and here it is curious to remark, that, a very few years ago, this distant region did not afford a third part of the gold which the Ural produced; but, by recent researches, an augmentation so rapid and extraordinary has taken place, that, in 1843, the eastern Siberian tract yielded considerably upwards of two millions and a quarter sterling, raising the total gold produce of the Russian empire to near three millions sterling!—*Sir R. S. Murchison, F.R.S.*

MILD TEMPERATURE OF WHITEHAVEN.

THE high mean annual temperature of this healthy part of Cumberland, and especially the very limited range of the thermometer in the winter season there,

as compared with inland towns, and many localities in the south of England, are very remarkable. During severe frosts, the thermometer at Wigton and Carlisle is frequently 15 or 20 degrees, and in the south as much as 30 or 35 degrees lower than at Whitehaven. Even at Paris, Lyons, and other places in France, the temperature in winter is often lower than at Whitehaven. Thus, on January 7, 1846, the thermometer at Lyons marked 9° centigrade, (below the freezing point,) equal to 17° of Fahrenheit; at Whitehaven, the thermometer throughout the winter was not lower than 28° F.; and on the night in question, the lowest point to which it fell was 36° or 19° higher than at Lyons. Carnations continued to bloom throughout the season, and numbers of wild strawberry plants in flower, were noticed in the immediate vicinity of the town. "On the whole," says Mr. J. F. Miller, in *Jameson's Journal*, "we believe there are very few localities in Great Britain, which are favoured with so mild and genial an atmosphere, or are less subject to those sudden vicissitudes of temperature which render the climate of England so trying to those subject to catarrhal diseases, bronchitis, or other more alarming affections of the lungs and air-passages."

SENSATION AT GREAT HEIGHTS.

D. LE RILEUR has submitted to the Paris Academy of Science, a paper on the sensation experienced at great heights; and which has been called by various medical writers, the *Mal de Montagne*. De Saussure, Humboldt, Boussingault, and many other travellers, generally felt acceleration of the pulse, prostration of strength, loss of appetite, nausea, vomiting, and other symptoms similar to those of sea sickness. D. Le Rileur and his companions, Messrs. Bravais and Martins, in ascending Mont Blanc, in August, 1844, suffered most during the first hour after their arrival at the summit of the mountain. In the second hour, they felt better, and after that they suffered very little; but they had no appetite during the whole of the time that they were at a height exceeding 4000 yards. The author distinguishes between the sensations created by the mere fatigue of ascension, and those which are caused by the atmosphere in elevated positions; the latter are the acceleration of the pulse, the loss of appetite, and sometimes somnolency.

WHITE RACE IN ALGERIA.

M. GUYRON confirms the statements of Reysnoul, Bruce, and Shaw, describing the Aurea in the province of Constantine, Algeria; they have white skin, blue eyes, and fair hair; they do not form distinct tribes, but predominate in some, and are very rare in others, and have inhabited the country for a very long time.

THE MAMMOTS OF THE BRITISH ISLES.

DR. BUCKLAND has happily and successfully shown that, for long ages, many species of carnivorous animals, now extinct, inhabited the caves of the British Islands. Again, in low tracts of Yorkshire, where tranquil lacustrine (lake like) deposits have occurred, there bones (even those of the lion) have been found so perfectly unbroken and unworn in the fine gravel in which they are heaped up, (as at Market Weighton,) that few persons would be disposed to deny, that such feline, and other animals, once roamed over the British isles, as well as other European countries. "Why, then, is it improbable, that large elephants, with a peculiarly thick integument, a close coating of wool, and much long shaggy hair, should have been the occupants of wide tracts of Northern Europe and Asia? This coating, Dr. Fleming has well remarked, was probably as impenetrable to rain and cold, as that of the monster ox of the Polar Circle. Such is the opinion of Sir R. J. Murchison, who thus accounts for the disappearance of the British Mammoths:

"When we turn from the great Tiberian continent,

which, anterior to its elevation, was the chief abode of the Mammoths, and look to the other parts of Europe, where their remains also occur; how remarkable is it that we find so many of these creatures to be justly proportioned to the magnitude of the ancient masses of land, which the labours of geologists have defined! Take the British isles, for example, and let all their low, recently elevated districts, be submerged; let, in short, England be viewed as the comparatively small island she was, when the ancient estuary of the Thames, including the plains of Hyde Park, Chelsea, Hounslow, and Uxbridge, were under the water;—when the Severn extended far into the heart of the kingdom, and large eastern tracts of the island were submerged; and then will then remain but moderately sized feeding grounds for the great quadrupeds, whose bones are found in the gravel of the adjacent rivers and estuaries. This limited area of subsistence could necessarily only keep up a small stock of such animals; and, just as we might expect, the remains of British Mammoths occur in very small numbers indeed, when compared with those of the great charnel-houses of Siberia, into which their bones had been carried down during countless ages, from the largest mass of surface which geological inquiries have yet shown to have been dry land during that epoch.—*Jameson's Journal*.

THE POTATO MALADY.

MR. A. SMEE, F.R.S. has just written an elaborate work in proof of the present potato malady being caused by the *Aphis vandator*, which comes upon the plant in the winged state, and there brings forth its young alive. After a short time, the insect brings forth other young, which young, of themselves, reproduce; thus, from a single specimen, a plant may become speedily covered with the insects. It has been proved by Reamur, that in five generations, one *Aphis* may be the progenitor of 5,904,900,000 descendants; and it is supposed that, in one year, there may be twenty generations; and Mr. Smece knows no reason why the *vandator* should be less prolific than its congeners. The *vandator*, likewise, attacks many other plants: upon one specimen of the beet, Mr. Smece states, that not less than 30,000, or 40,000 may sometimes be found.

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.

By F. E. S.

CHAP. VII.

THE GAME IN BARSTONE PARK.

WE had arrived within a quarter of a mile of the gate; and I had just settled, to my thorough dissatisfaction, that the old footman must be a humourist, and had diverted himself by making a kind of April-fool out of season of me, when through the trees, which at that spot stretched their huge branches across the road, so as to form a complete arch, I fancied I perceived the flutter of a woman's dress; and, in another moment, a turn in the drive disclosed to my view a female form, which I instantly recognised as that of Clara Saville.

Without a minute's hesitation, I sprang to the ground before Lawless had time to pull up, and, saying to him, "I shall be back again directly;—wait for me—there's a good fellow," I hastily entered a winding path, which led through the trees to the spot where I had seen the young lady, leaving my companion mute from astonishment. Up to this moment, acting solely from a sort of

instinctive impulse, which made me wish to see and speak to Miss Saville, I had never considered the light in which my proceedings might appear to her. What right, I now asked myself, have I to intrude upon her privacy, and, as it were, force my company upon her, whether she wishes it or not? May she not look upon it as an impertinent intrusion? As these thoughts flitted through my brain, I slackened my pace; and, had it not been for very shame, could have found in my heart to turn back again. This, however, I resolved not to do; having committed myself so far, I determined to give her an opportunity of seeing me, and, if she should show any intention of avoiding me, it would then be time enough to retrace my steps, and leave her unmolested. With this design I proceeded slowly up the path, stopping now and then as if to admire the view, until a turn of the walk brought me in sight of a rustic bench, on which was seated the young lady I had before observed. As soon as she perceived me, she rose and came towards me, disclosing, as she did so, the graceful form and beautiful features of my partner of the preceding evening. The morning costume, including a most irresistible little cottage-bonnet lined with pink, was even more becoming to her than the ball-dress; and when, instead of the cold air of constraint which had characterised her manner of the previous evening, she advanced to meet me with a slight blush and the most bewitching smile of welcome that ever set man's heart beating, I thought I had never seen anything so perfectly lovely before.

"I must ask your forgiveness for venturing thus to intrude upon you, Miss Saville," began I, after we had exchanged salutations; "but the temptation of learning from your own lips that you had sustained no injury, was too strong to be resisted, more particularly after the disappointment of finding you were from home, when I did myself the pleasure of calling on Mr. Vernon to inquire after you."

"Nay, there is nothing to forgive," replied Miss Saville; "on the contrary," she continued, blushing slightly, "I was most anxious to see you, in order to thank you for the eminent service you rendered me yesterday evening."

"Really, it is not worth mentioning," returned I; "it is only what any other gentleman in the room would have done had he been in my situation; it was good Mrs. Trotter's shawl saved you; I could have done nothing without that."

"You shall not cheat me out of my gratitude in that way," replied she, smiling; "the shawl would have been of little avail, had it not been so promptly and energetically applied; and, as for the other gentlemen, they certainly were very ready with their offers of assistance after the danger was over. I am afraid," she continued, looking down, "you must have repented the trouble you had taken, when you found, what a thankless person you had exerted yourself to save."

"Indeed, no such idea crossed my mind for an instant; the slight service I was able to render you was quite repaid by the pleasure of knowing that I had been fortunate enough to prevent you from sustaining injury," said I.

"You are very kind," was the reply; "but I can assure you I have been exceedingly distressed and annoyed by imagining how wholly destitute of gratitude you must have considered me!"

"Lucy Markham told me such would be the case," replied I, smiling.

"Did she—a dear warm-hearted girl,—she always does me justice!" exclaimed Miss Saville, as she raised her beautiful eyes, sparkling with animation, to my face. She then, for the first time, observed my injured arm, and added quickly, "but you wear your arm in a sling; I hope—that is—I am afraid—I trust it was not in saving me that it was hurt!"

"It is a mere trifle," replied I; "the wristband of my shirt sleeve caught fire, and burnt my arm, but it is

nothing of any consequence, I can assure you; pray do not let it alarm you," continued I anxiously, for my companion had turned suddenly very pale, and resumed her seat upon the bench.

"I am very foolish," said she, smiling faintly, "but the alarm of last night has made me sadly nervous. Oh! Mr. Fairleigh, what must you have thought of me? you exerted yourself, and successfully, to save my life, receiving a painful injury in so doing, whilst I left the house without offering you the thanks due even to the commonest service imaginable."

"You were not then aware that I had burnt my arm, remember; and forgive me for adding," returned I, (for I saw that she was really distressed at the idea of my considering her wanting in gratitude,) "that it did not require any unusual degree of penetration to perceive that you were not altogether a free agent."

"No, indeed," replied she, eagerly catching at the idea, "Mr. Vernon, my guardian,—he always means to be very kind I am sure; but," she added, sinking her voice, "he is so very particular about my manner to gentlemen, and he speaks so sternly sometimes, that—I know it is very silly,—but I cannot help feeling afraid of him. I mention this, sir, to prevent your judging me too harshly, and I trust to your generosity not to take any unfair advantage of my openness; and now," she added, fixing her large eyes upon me with an imploring look which would have melted the toughest old anchorite that ever chewed grey peas, "you will not think me so very ungrateful, will you?"

"My dear Miss Saville," replied I, (with difficulty repressing a sudden impulse which came across me to throw my arm round her waist, and, regardless of consequences, tell her she was an angel)—"my dear Miss Saville, let me beg you to believe I never dreamt of blaming you for a moment; on the contrary, I pay you no compliment, but only mention the simple truth, when I tell you that I admired your behaviour throughout the whole affair exceedingly; your presence of mind and self-control were greater than, under the circumstances, I could have supposed possible." As she made no reply to this, but sat looking steadfastly on the ground, with her head turned so as to conceal her face, I continued—"I hope it is unnecessary for me to add, that you need not entertain the slightest fear of my making any indiscreet use of the frankness with which you have done me the honour of speaking to me—but I am forgetting half my business," added I, wishing to set her at ease again, "I am charged with all sorts of kind messages to you from good Mrs. Coleman and Miss Markham; I presume you would wish me to tell them I have had the pleasure of seeing you?"

"Oh yes, by all means," replied Miss Saville, looking up with a pleased expression, "give my kind love to them both, and tell dear Lucy I shall come over to see her as soon as ever I can; and say that, thanks to Mr. Fairleigh," she added, colouring slightly, "I am none the worse for last night's alarm."

"I will not intrude upon you longer, then, having delivered my message," said I; "I have kept my companion, the gentleman who was so unfortunate as to overturn the candelabrum, waiting an unconscionable time already; he is very penitent for his offence; may I venture to relieve his mind by telling him that you forgive him?"

"Pray do so," was the reply; "I never bear malice; besides, it was entirely an accident, you know. How thoroughly wretched he seemed when he found what he had done; frightened as I was, I could scarcely help laughing when I caught a glimpse of his face, he looked so delightfully miserable," added she, with a little merry laugh. After a moment's pause, she continued—"I'm afraid Mr. Vernon will think I am lost; if he should happen to inquire after me, and I'm not forthcoming, there will be a fine fuss. I suppose I must tell him that I have met you, and that will make him cross for the rest of the day—heigho!"

"Surely," said I, "he can never be so unreasonable as to blame you for such a trifle as that. Does he expect you to be a nun because he lives in a priory?"

"Almost, I really think," was the reply; "and now, good bye, Mr. Fairleigh," she continued—"I shall feel so much happier since I have been able to explain to you that I am not quite a monster of ingratitude."

"If that is the case, I am bound to rejoice in it also," answered I, "though I would fain convince you that the explanation was not required."

Her only reply to this was an incredulous shake of the head; and, once more wishing me good morning, she tripped along the path; and, when I turned to look after her, her graceful figure had disappeared among the trees.

With a flushed brow and beating heart, (gentle reader, I was barely twenty,) I hastened to rejoin my companion, who, as might be expected, was not in the most amiable humour imaginable, having had to restrain the impatience of two fiery horses for a space of time nearly approaching half an hour.

"Really, Lawless," I began, "I am quite ashamed."

"Oh, you are, are you?" was the rejoinder. "I should rather think you ought to be, too. But it's always the way with you fellows who pretend to be steady and moral, and all that sort of thing—when you do find a chance of getting into mischief, you're worse a great deal than a man like myself, for instance, who, without being bothered with any particular principles of any kind, has what I call a general sense of fitness and propriety, and does his dissipation sensibly and correctly. But to go tearing off like a lunatic after the first petticoat you see fluttering among the bushes in a gentleman's park, and leaving your friend to hold in two thorough-bred peppery devils, that are enough to pull a man's arms off, for above half an hour, it's too bad a great deal. Why, just before you came, I fully expected when that mare was plunging about on her hind legs—"

"How lovely she looked!" interrupted I, thinking aloud.

"You thought so, did you?" rejoined Lawless; "I wish you'd just had to hold her; her mouth's as hard—"

"Her mouth is perfect," replied I, emphatically; "quite perfect."

"Well, that's cool," muttered Lawless; "he'll put me in a passion directly;—pray, Sir, may I ask how on earth you come to know anything about her mouth?"

"How do I know anything about her mouth?" exclaimed I. "Did I not watch with delight its ever-varying expression?—mark each movement of those beautiful lips, and drink in every syllable that fell from them?—not observe her mouth! Think you, when we have been conversing together for the last half-hour, that I could fail to do so?"

"Oh, he's gone stark staring mad!" exclaimed Lawless; "straight waistcoats, Bedlam, and all that sort of thing, you know:—conversing with my bay mare for the last half-hour, and drinking in every syllable that fell from her beautiful lips—oh, he's raving!"

"What do you mean?" said I; at length awaking to some consciousness of sublimity affairs—"Your mare!—who ever thought of your mare? it's Miss Saville I'm talking about."

"Miss Saville!" repeated Lawless; giving vent to a long whistle, expressive of incredulity; "why, you don't mean to say you've been talking to Miss Saville all this time, do you?"

"To be sure I have," replied I; "and a very interesting and agreeable conversation it was too."

"Well," exclaimed Lawless, after a short pause; "all the luck in this matter seems to fall to your share; so the sooner I get out of it the better. It won't break my heart, that's one comfort;—if the young woman has the bad taste to prefer you to me, why, it can't be helped, you know;—but what did she say for herself, eh?"

"She sent you her forgiveness, for one thing," replied

I; and I then proceeded to relate such particulars of the interview as I considered expedient; which recital, and our remarks thereupon, furnished conversation during the remainder of our drive.

HISTORY OF THE COTTON MANUFACTURE.¹

THE next step in the advance of the cotton machines was made by the celebrated Richard Arkwright, who, either by improving on the inventions of others, or maturely developing his own, became the first of cotton lords, gaining the honours of knighthood, and the more solid benefits of a princely fortune. Arkwright was born at Preston in 1732, where he became apprentice to a barber, but rather directed his attention to mechanical inventions than the forming of wigs, or the adornment of petted curls. His first attempts were directed to the construction of a machine which should move perpetually; and this dream of a constant motion occupied his mind until circumstances directed his genius in a more useful direction. He became intimate with Hay, a clock-maker, who one day advised Arkwright to cease from the child's play of constructing curious toys, at which the world might, indeed, look for a moment in surprise, but finding itself none the wiser, would be sure to pass on, smiling, with a sort of contemptuous pity, on the useless productions. Arkwright heard the warning from one who seemed to know the wants of the world around him, and in further conversation Hay directed his friend to aim at the formation of some machine which would facilitate the weaver's labour, providing him with a more abundant and cheaper material for his warp. The inventions of Wyatt and Hargreaves had but stimulated, not satisfied expectation, and Arkwright began to think he might be one of those fortunate men destined to advance the wealth and happiness of his country. Accordingly, he and Hay set to work; and, after many consultations, produced a machine which seemed likely to answer the end proposed. This was not, however, constructed without some aid from others. Mr. Atherton, of Warrington, lent Arkwright the services of a smith and watch-tool maker; and Mr. Smalley, a spirit-dealer at Preston, agreed to advance some money. This last item was especially serviceable to the poor inventor, who was unable at that time to go to the poll at the election of General Burgoyne until some friends provided him with decent clothing. Such, when on the very threshold of his successful career, was the condition of him, who became the honoured and rich Sir Richard Arkwright.

The Master of the Preston Grammar School was persuaded by Mr. Smalley to place a room at the disposal of his friend the mechanist, where the various experiments were performed—and there, at last, the machine was completed. It seemed to work well, but all was, as yet, tantalizing uncertainty and fear; the invention might yet disappoint the ardent expectations now forming in the mind of Arkwright, or the secret become prematurely known, when all the fruits of their studies might be reaped by others. The spinners, too, were not men to be trifled with, and, should they discover the nature of his invention, it would soon be destroyed by a riotous mob; for those who obtained their livelihood by hand-spinning were infuriated by the attempts to introduce the powers of machinery within their own peculiar province. He at length felt the crisis of his life had arrived,—that the tide had risen, which, "taken at the flood, rolls on to fortune,"—and a patent being procured in 1767, Arkwright took his stand before England, and entered the race for fame and wealth. In his application for the patent he is said to have described himself as "Richard Arkwright, clock-maker, of Nottingham;" and some have severely

censured him for this *untrue* description, which they regard as an attempt to support his claims to the various inventions patented in his name. Doubtless, persons would be less surprised at the production of an elaborate piece of mechanism by a clock-maker than if the same work were ascribed to a barber; but we omit all theorizing on a statement which is not supported by facts, as Arkwright did not so describe himself; for the term clock-maker does not appear in the patent. His machine was called the "Water-frame," being turned by water, like all the early spinning mills; for that was the great power of his age; and if Brindley deemed all rivers created but to form canals, some of the early cotton mill-owners may have regarded streams as chiefly destined to turn mills. Well, indeed, did water perform its task; but the steam-engine has, in most cases, superseded, with its iron arm and ceaseless energies, "the quiet old mill stream that long years ago" threw its sparkling waters on many a wheel. Arkwright, being joined by several wealthy persons, erected a cotton mill at Nottingham, and by incessant studies developed the powers of his machine. During five years no returns of capital were received, whilst an outlay of 20,000*l.* had been required to carry out the requisite improvements. But those efforts and risks were at length rewarded by the successful working of his invention, and Arkwright became a manufacturer on a vast scale. He was not, however, permitted to enjoy in peace the rewards of his severe application and numerous perplexities. The Lancashire manufacturers infringed his patent with a degree of audacity unprecedented, and Arkwright saw his inventions used by rivals who, strong in their combinations, defied all appeals to law. Arkwright's patrons determined to resist this opposition and spoliation. He therefore resolved upon opposing the numerous attempts to infringe his patent, and commenced nine actions against various manufacturers in the year 1781. Now came the moment of triumph for his mercenary rivals, who succeeded in procuring the nullification of Arkwright's patent, on the ground that his inventions had been described with a studied obscurity. Thus, after years of trouble and vast outlay, the improver of the water-frame saw his discoveries flung as a prey to every speculator; in addition to which, the manufacturers opposed him in every way, refusing even to purchase his yarns, and driving him to weave the productions of his own spinning frame.

About four years after, in 1785, another effort was made to recover what Arkwright deemed his rights; and on the 17th of February he obtained a verdict in his favour, by which the validity of the patent was established. Arkwright's success was short-lived; his rivals still persisted; and in a great trial, on June 25th, overturned his claims to the invention of the water-frame. He was now left to contend, on unprivileged ground, with his opponents, and soon became the greatest cotton manufacturer, even regulating the values of yarn throughout the kingdom, as all the spinners followed his prices. The loss of his patent had so irritated him against the Lancashire manufacturers, that he attempted to raise the Scotch spinners to a rivalry with those of England, observing, in the first ebullitions of his anger, that "he would find a razor in Scotland to shave Manchester." His opponents were witty on this term borrowed from his former trade, but he evinced a determination to carry out the threat by connecting himself with Mr. Dale of Lanark Mills. He did not, however, persist in such an exclusive spirit, and soon became noted for his vast works at Cromford in Derbyshire, where each year found his vast wealth increasing.

The barber of Preston now rose to honour, being chosen High Sheriff of Derbyshire in 1786; in which year he also received the honour of knighthood upon presenting an address to the king from the county, congratulating the monarch on his escape from the knife of Margaret Nicholson.

His great improvement was the *drawing machine*, by

which the cotton wool is drawn out so as to extend to more than twice the length of the original *roving*. Such a lengthening is requisite for the production of those delicately fine threads from which the elegant productions of the loom are formed. Without this drawing machine our weavers could only produce coarse and heavy materials instead of the gossamer-like substance of modern looms.

The principle of the drawing machine consists in the passing of the thread between one pair of rollers after it comes from between another pair, the motion of the former pair being more rapid than that of the latter. If the two pairs of rollers moved at the same rate, the thread would only be *flattened* in the passage; but if the second set revolve more rapidly than the first, the cotton must be *lengthened*. Thus, suppose the second pair to move with twice the rapidity of the preceding, the cotton will not supply the thread fast enough for the former, and it must either *break* or *stretch*. The elasticity of the material prevents it from snapping; and the extension of the thread is therefore the necessary result. Three advantages are thus obtained with the greatest certainty: first, the line of cotton can be extended to the particular length required by the manufacturer; in the next place, this lengthened thread can be brought to any degree of fineness; and lastly, this thread, of many miles in length, is kept, by the harmonized and uniform action of the rollers, to the same thickness throughout. The perfection and beauty of this machinery may be estimated by the fact, that, from a pound of raw cotton, a fine and even thread may be produced nearly two hundred miles long.

The principle of this drawing machine was certainly first developed by Wyatt, in his rolling engine; but being expanded in various details by Arkwright, and connected with the spinning jenny of Hargreaves, became the source of numerous fortunes, and the main spring of the cotton manufacture. Arkwright must therefore be regarded rather as an ingenious adapter and judicious improver, than an inventor. But let us not forget the fertility of resource, patient investigation, and mechanical skill, required by him who adapts to one end the various and scattered devices of others. Arkwright's improvement therefore demands our highest praise, and few will refuse to join in the commendation bestowed by parliament in 1774, when his labours were pronounced as laudable as they were legal.

Arkwright died near his works at Crompton, on the 3rd of August, 1792, at the age of sixty, having gained that which his predecessors, Wyatt and Hargreaves, failed to obtain—a vast fortune.

We have now traced the history of the cotton manufacture through the three stages indicated by the labours of three men—Wyatt, Hargreaves, and Arkwright; the first developing the principle of the carding machine, and the third still further improving the discovery of the first, besides adding to the efficiency of the spinning machine of the second. But improvements are not yet over in this wide field, and we now call the reader's attention to the discoveries of a fourth genius: the invention of the spinning mule, by Crompton.

The machinery of Arkwright, Hargreaves, and Wyatt, did not yet satisfy the wants of those who required a finer cotton thread for weaving than could be furnished by these contrivances.

A poor weaver, named Samuel Crompton, living at Hall-in-the-Wood, near Bolton, in Lancashire, first contrived a plan for effecting the desired object, by which the beauty and delicacy of cotton fabrics were advanced far beyond the most glowing anticipations. He saw that if the threads could be *stretched in the very process of spinning*, a piece of roving might be drawn out so as to furnish from a pound of cotton some thousands of yards more than could be obtained from the spinning jenny.

The reader must remember that the fineness of cotton thread is expressed by certain figures which denote the

number of hanks produced from a pound's weight of the roving. Thus, No. 40, implies that forty hanks of such thread are made from a pound; No. 60, that sixty hanks are so formed; and thus for all others up to the highest. As each hank measures eight hundred and forty yards, it is evident that the finer the cotton is stretched, the greater will be the number of hanks produced from a given weight of roving. It was at one time supposed that eighty hanks to the pound was the highest possible efforts of the spinning machines, but since the inventions of Crompton cotton yarn has been spun bearing the No. 350.

Between the years 1774 and 1779, Crompton was continually experimenting on the various plans which offered a prospect of producing finer cotton, and thus extending the manufacturing power of England. In 1771, his machine was finished, being however exceedingly rude, for the inventor possessed little operative skill; and was therefore unable to represent in the machine the fulness of his designs.

Crompton, nevertheless, set the engine to work, not with any hope of fame or honour; patents and speculations were far from the mind of this humble man, whose only wish was to use his invention privately for effecting some little improvement in his family comforts, and securing additional wages without the wear and tear of greater bodily exertion. At first his employers were surprised at the even beauty and fineness of his productions; nor could they refrain, whilst paying him the higher wages suited to his improved material, from wondering at the rapidity with which such perfect work was accomplished.

The whisper, that a new advance had been made in the machines of the cotton manufacture, soon spread amongst Crompton's neighbours at Hall-in-the-Wood, and thence ran to Bolton, startling the affrighted hand-spinners with the hated image of another rival to their craft. Persons now came from various parts to examine the details of the new machine, much to Crompton's annoyance, who complained bitterly of the interruption thus given to his quiet labours by the busy curiosity of the idle, and the feverish prying of the avaricious speculator. Many were eager to investigate the principle of the new inventions, in order to adapt it to their own engines, and Crompton clearly saw that his machine would soon come into use.

He named it the *Mule-Jenny*, thereby intimating that it was constructed partly from the water-frame of Arkwright, which was first moved by a horse-wheel, and partly from the jenny of Hargreaves; but it was known for some time in his neighbourhood as the "Hall-in-the-Wood wheel," a local appellation which has never been general.

The spindles of the mule are not set in a fixed frame, but on moveable supports, which run upon wheels fitted to grooves in the floor. Thus a long line of spindles may be seen, constantly moving backwards and forwards during the spinning process; so that at one moment a spectator sees the whirling and humming ranks of a thousand spindles approach within a few inches of his body, then slowly and calmly the mass stops and retreats to its former distance, after which the frame again advances as before; and thus through day and night the untired engine treads its ceaseless round. The object of these oscillating movements is to procure an *equable stretching* of the delicate threads during the spinning; thus when the frame is *wheeled on*, the cotton is wound up on the spindles; but when it has returned through a portion of its sweep, the rovings are suddenly tightened, and as the machine continues to retreat, it necessarily *stretches* the thread attached to the spindles, then coming forward winds up the distended lines, and again repeats the beautiful operation. Such nicety of movement requires the most delicate adjustment of the complicated machinery, and the most perfect control over the steam-power which moves the whole.

(To be concluded in next Number.)

THE MAIDEN AUNT,

No. III.—Чап. II.

I SAT alone in the pretty drawing-room of Enmore Hall, for I had not invited Mrs. Alvanley to assist me in receiving Miss Kinnaird, though she paid me a morning visit of two hours' duration, on the day which Owen had fixed for his ward's arrival. It was perhaps churlish of me, but my feelings were really and deeply interested, and I did not want either to make conversation, or to have it made for me. I don't think I am by nature sentimental, and I am quite sure that, in the present instance, I have neither sought nor permitted the peculiar state of mental self-indulgence, to which the world satirically affixes that epithet; but I was quite surprised at the degree of my own emotion when the sound of wheels on the frost-cripsed gravel—as quick, as light, and as traceless, as the passage of feelings across a world-hardened heart—announced that my visitor was actually come. I never can sit still on the sofa in the drawing-room, when I know that a person whom I wish to welcome is entering the hall-door. I have been repeatedly told that it is a weakness, and that it cannot hasten the meeting by more than half a minute, and I admit the truth of the objection; nevertheless, it is one of those cases in which I would not, if I could, be otherwise than weak. Heaven help poor human nature, if the *cui bono* question is to be asked in matters of affection! Those little exuberances, those delicious exaggerations, are just the very touches on which its beauty depends—the bloom on the butterfly's wing, needless to it, perhaps, as a mere flying-machine, but everything to it as a butterfly. I remember once stopping in a diligence, at night, to take up a Norman countrywoman; she was parting from her husband and child; and many were the long farewells which they exchanged ere she entered the vehicle. But when she was fairly in, and we were beginning to move, she nearly dislocated her own neck and my shoulder by stooping out of the window to give an extra and most inconvenient kiss to the little boy, who was held up by his papa to receive it. She had been hugging him to her heart's content the moment before—but all the *sweetness* of her affection was concentrated in that last unnecessary salute; I positively loved her for it; and though I travelled in her company during thirteen sultry hours, and she chewed garlic and shut the windows, such was the potency of that little indication of heart, that I had not arrived at hating her when we parted. But all this while Miss Kinnaird is on the carriage steps; I must hasten to assist her in descending. She returned my greetings with a warmth that was more than merely polite, and an ease which seemed to me scarcely natural at the shy and girlish age of eighteen. Her bonnet and veil nearly hid her face, but her unusual height, and singularly graceful figure, struck me at once; I had no time to analyze my impressions, for she passed quickly upstairs, attended by her own maid, and piloted by mine, to make a hasty toilette after her journey, while I was left to receive and entertain her brother.

Captain Frank Kinnaird, an elegant-looking young man, with very pleasing manners, and with no important resemblance to his father in look, *tone*, or air, first introduced himself to me, and then performed the same ceremony by his friend Captain Everard—a tall stiff-looking person, whose apparition surprised me not a little—and the two gentlemen then followed me into the drawing-room.

"We trespass on your hospitality rather unwarrantably," said Frank, as he established himself on the corner of the sofa; "but the lights in your windows, suggesting visions of fire and sofa, tea and muffins,

were really too tempting to be resisted by two travel-worn and frost-bitten mortals at this hour of a November night."

I said something civil about hoping to see him at Enmore Hall while his sister continued to be its inmate, as often as his leisure would permit; and I concluded with a half-dubious bow to his silent friend, who immediately acknowledged the compliment.

"You are very kind," said he, with grave politeness; "and the prospect is peculiarly agreeable when contrasted with our bachelor establishment at Acton Cottage. Neither of us can trust the other to make tea; and, as we have only one tea-pot, and the cook refuses to boil water for us more than twice a-day, we are obliged to take it by turns to go without 'the cup which cheers but not inebriates.'"

I was puzzled by the extreme quietness of manner with which this speech was delivered, and scarcely knew whether to laugh or not. My instinct, which is seldom at fault in detecting at once those who are likely to prove uncongenial on further acquaintance, had inspired me with an impulse of dislike to Captain Everard at the moment in which he was so unexpectedly introduced to my notice. I cannot deny that he looked like a gentleman, and some people might even have thought him good-looking; but he was pale, grave, and erect; and I made up my mind that he would prove to be sickly, stern, and formal; and I was not to be shaken in this determination by an ease of manner, and an expression of humour about the mouth, which seemed to indicate better things. Accordingly, I addressed myself principally to Frank Kinnaid, and expressed a charitable hope that his sister was not over-tired with her journey.

"She will be quite rested to-morrow," was his answer, "and you will then be able to make acquaintance with each other,—a process which I fancy that ladies can accomplish far more rapidly than gentlemen. I think I may venture to say, that Miss Forde will find no reason to regret the kindness which has induced her to take charge of Edith,—eh, Everard?"

"Miss Kinnaid is perfectly faultless in person, manners, mind, and heart," returned the gentleman thus appealed to. "I am qualified to pronounce this opinion, for it is full twenty-four hours since I was introduced to her."

"Ah, you laugh at me," cried Kinnaid, good-humouredly; "but I have the satisfaction of feeling sure, that if you had such a sister of your own, you would be just as proud of her as I am."

"There can be no doubt of that," answered Captain Everard. "Short as our acquaintance has been, I am beginning to feel proud of her already."

"We won't attend to him, Miss Forde," exclaimed Kinnaid, turning to me; "he is an incorrigible cynic—a fellow that doesn't believe in the existence of anything good upon the face of the earth."

"A comprehensive assertion that," coolly remarked Captain Everard, by way of comment.

"But," proceeded Frank, without minding him, "I am afraid of saying too much about Edith beforehand, you know, lest you should be disappointed; and I know I may generally be supposed to be partial. I dare say she is something wonderful—much like other young ladies; but she has had many advantages in education, and she has certainly made the most of them—not that she is a blue-stocking!—(I hate blue-stockings!)—nor one of those moving automata of accomplishments that one dares not come near, for fear one should touch the spring by accident, and they should go off into a bravura, or a German drama: no, she has no pedantry or affectation about her, of any kind; but," and here he lowered his voice, and assumed a confidential air, "I can't help speaking to you as an old friend, because I have heard so much of you and yours in days long gone by. She really is a very attractive sort of girl; and when she is presented next spring, we really do expect that she will make a sensation."

"Don't be afraid of speaking too warmly to me," cried I, delighted at his animation in his sister's behalf. "I am a very old-fashioned person in most of my opinions, and I always suspect the genuineness of an affection which is afraid to show its face."

Captain Everard gave me a peculiar look, which seemed to express, "How much I *could* say in answer to that sentiment; but I am not going to say anything." (I have often observed this kind of expression in the eyes of highly argumentative persons, when their acquaintance with you is as yet too recent to justify their attacking you for every word you utter, and when, consequently, they are just endurable—which, when the compassionate restraints of good-breeding drop away, they are *not*.) He then turned to his friend, and said,—

"Miss Kinnaid is highly accomplished, I know; yet I own I did fancy that her touch on the piano—"

"I don't know what fault you can find with her touch on the piano," replied Frank, shortly. "That fellow Thalberg said it was excellent, when he heard her, and I should think he knew rather more about it than either you or I. But how absurd I am!" added he, checking himself, "or rather, how absurd you are! Why you have never heard her play at all."

"Of course not," answered Everard; "for even you would hardly reckon among her perfections the power of introducing a pianoforte into her travelling-carriage. Neither did I find fault with her touch: I only just mentioned it—and lo! you hurl aside that poor inefficient mask of polite indifference directly, and show a scowling face, with defiance in every line. And I am sure Miss Forde will approve of me for having produced this effect, for I have just heard her say that she likes affection to shew its face boldly, and go flaunting and shouting about the streets and markets to the tune of 'I love her, *how* I love her!'"

His emphasis was so gravely comic as he pronounced these words, that I could not help laughing, though it was at myself. I had no time to undertake my defence, for, at this moment, Miss Kinnaid entered, and the attention of two of the party, at least, was immediately absorbed by her.

I was absolutely astonished at the splendour of her beauty. Descriptions of person are proverbially ineffective, yet I must try to give some idea of her peculiar characteristics. I have already said that she was more than usually tall; but the moulding of her figure was at once so round and so delicate, that whilst her worst foe could not have dared to call her lanky, her most injudicious admirer would never have thought of describing her as "a fine woman." Her head was small almost to a fault, covered with that abundance of dark hair which had made such an impression upon Owen, and which was drawn back from her brow, and braided together in one interminable length of glossy plait, arranged so as to form a natural coronet. Her forehead was low and wide; the eyebrows and eyelashes nearly black; the eyes deep-set, almond shaped, and of the darkest possible gray; the nose high and exquisitely chiselled; the mouth small, full, and with that peculiar curve of lip which is almost disdainful when in repose. She moved like a queen of nature's making, and it was impossible to look at her without mentally agreeing with her brother's opinion, that a creature so gifted, both by nature and fortune, would, indeed, "make a sensation" when she should appear in the gay world for which she was intended. I found that I was losing myself in melancholy wonder whether she would not be utterly spoiled by the dangerous admiration of the multitude, and what would be her final destiny: so I shook off my meditative humour at once, and set to work in good earnest to make myself and my tea as agreeable to my visitors as I could.

We naturally fell into conversation upon Alford and its neighbourhood, Miss Kinnaid inquiring into the nature and number of its picturesque attractions, with

the eagerness of a London-bred girl, whose conceptions of country enjoyments derive their beautiful colouring from the recollection of a happy childhood spent among woods and waters, flowers and birds. This was a point on which I could be eloquent, and I counted up, with animation almost equal to her own, the walks and views to which I hoped to introduce her, lamenting all the while that her first acquaintance with the soft and various loveliness of Devonshire should be made in the leafless month of November.

"Edith does not ask you about the men and women of the place, you perceive," cried Frank Kinnaird, mockingly, yet with an evident wish to call my attention to the simplicity of his sister's tastes. "She is a very romantic young lady; all her sympathies are for hills, meadows, and waterfalls. But I—who am a matter-of-fact person, who live by eating, drinking, and talking, and am resolved to obtain as many pleasant helps to those three grand occupations as I can for the next month or two—I may perhaps be permitted to inquire what kind of society is attainable at Alford?"

"Your sister is infinitely indebted to you, Kinnaird," said Captain Everard. "She was just coming to that question. She, however, would have been compelled to ask it in a circumlocutory manner, and with an air of nonchalance, as if it dropped out by accident, so as not to incur the reproach of feeling any interest in her fellow-creatures; while you are able to obtain the information she wants openly, without the trouble of manoeuvring, or the danger of disguise. You are an invaluable friend."

"That is a part of your system of having no faith in anybody," said Miss Kinnaird, quickly.

"My system of having no faith in anybody!" repeated he, with an air of astonishment; "I did not know I had such a system. Pray how did you find it out?"

"I dare say," exclaimed she, evading the question, "you do not believe in the reality of my love of beautiful country; you think I say it for effect, and that I am ashamed to express my true opinions, and think it very fine to assume indifference to everything except the beauties of nature, and, perhaps, books. But you are quite mistaken. I am not in the least ashamed of owning that I am very fond of society; that I delight in balls, and that I shall be excessively glad to hear that there is any chance of my going to one at Alford. Only you know," she added, turning to me, "that is no contradiction to my loving a fine view, and enjoying a country walk."

"Far from it," answered I; "the more keen one's perceptions of pleasure are, the more comprehensive they are likely to be,—at least, that is my idea."

"Your system, you mean, Miss Forde," said Captain Everard. "We have all got systems, only we don't know what they are till this lady is so good as to find them out for us. If I chose, I could dispute every assertion which Miss Kinnaird made in her last speech, especially the closing one; but I am so much interested to know how she discovered my system, that I cannot rest till she has told me. You won't refuse to explain, will you?" added he, addressing himself directly to her.

The young lady blushed, but did not seem at all disposed to retreat from what she had said. "Oh," she replied, "people who have the sort of views that you have, cannot conceal them if they would. One sees it all immediately. The manner in which you listened to Frank's account of his two friends, at dinner to-day, showed me at once what you thought."

"Indeed!" said he, apparently much amused. "Miss Forde, I am afraid you will find your companion very dangerous. You will stand committed to unknown and elaborate systems, not by the words you speak, but by the manner in which you listen; and at dinner too, when one is apt to fancy that observation is at rest, and the stricter restraints of society may be a little

relaxed. You will never be safe; and I really know not what advice to give you, for the last refuge of a cautious mind—silence—is converted into an ambush of the enemy."

"Listening is often a great deal more expressive than talking," said Miss Kinnaird, with playful determination; "besides, you were not wholly silent."

"I spoke, did I?" cried he. "I feel infinitely gratified to think that my words should have made so deep an impression."

I came to Edith's assistance here, for this last stroke evidently disconcerted her a little. "What is the story of Captain Kinnaird's two friends," asked I, "which has given rise to this war of words? I cannot decide which of you is wrong till I know the whole history."

"Oh! I'll enlighten you," cried Frank: "Everard, you know, is not in our regiment now; he exchanged more than two years since, and has been to the West Indies, and had the yellow fever, &c. &c., and that is why he is down here with me, on sick leave, recruiting a little. So he was asking me after some of our old friends to-day; and, among other histories, I told him of a fellow of the name of Harrison, whom we both knew very well, and who has just sold out, and bought land in Australia. A strange fancy it is, to be sure, and he has persuaded another fellow of ours—Milford (Everard, you didn't know Milford, he was after your time)—to join him, and they sunk the price of their commissions, and such private property as they had besides, in the purchase of I don't know how many acres, somewhere beyond Sydney, and they sailed last month, and are gone to set up farming together: the only wise part of the plan seems to me to be their going together, for they were always uncommonly great cronies; and it will certainly be better for them to have each other to talk to, instead of settlers and natives, and those sort of people."

"And I believe the head and front of my offending," said Captain Everard to Miss Kinnaird, "was, that I ventured to think it the only, or the most, unwise part of the plan! Did I do anything worse than that—except listen?"

She laughed, and replied,—"Oh yes, you did much worse. When Frank told you that there was a *real* friendship between them, you said you hoped it might last."

"Upon my word, Edith," cried her brother, joining Captain Everard and myself in the laugh which these words elicited, "it was a very charitable hope of Everard's, for I am sure if it does not last, the poor fellows will be in pretty nearly the most uncomfortable situation that I can imagine. Would you have had him hope that it might not last?"

"Yes, I think I may retort upon my assailant," added Everard. "I won't be so very general in my assertion; but it is pretty evidently Miss Kinnaird's system to have no faith in me."

"Oh, the tone in which you said it!" persisted she; "it implied such a disbelief in the possibility of its lasting. You may laugh, if you please, but I am sure it did. Now, can you say—truly and honestly—that you do not expect them to quarrel almost immediately?"

"I believe, on my honour and conscience," replied Captain Everard, with solemnity, "that by this day six months—I say six months, because I like to be on the safe side—they will not be upon speaking terms."

"There!" cried Edith, in triumph. "Was I not right? But how I pity you!"

"You pity me," rejoined he, "because I have a little more experience in human nature than it is possible or natural that you should have. Well, if such experience be profitable, I will allow that it is not very exhilarating. But I have this great advantage, that I am not undergoing perpetual disappointments. Knowing the truth of that wise old saying, that 'every man has his price,'

I am neither exuberantly confident nor jealously suspicious; but I pay for what I get, and never consider myself ill-used, unless, as sometimes happens, I don't get what I have paid for."

"Is it really possible?" exclaimed Edith, casting up her eyes, while her face glowed with generous and indignant astonishment. "Can I be hearing such words said in earnest? Oh, how glad, how thankful I am that there is not one spark of truth in them—that there are such things as friendship, and honour, and nobleness—that there are, have been, and will be, men who would die sooner than do what their conscience disapproved, though they might gain kingdoms by doing it! But it makes me uncomfortable to hear it said—though I know how false it is."

She stopped, seemingly quite abashed at her own warmth. "Everard is quizzing you, Edith," said her brother; "he is only trying to put you in a passion, and I must say he has succeeded."

"He is putting me in a passion also," said I, "and I dare say that is more than he intended. Captain Everard, we cannot allow these assertions to pass. Surely you are not in earnest."

He turned to me with a half-laugh, as though he had scarcely expected me to interpose with so much animation, and felt that a little more seriousness was necessary in replying to me than he had thought it incumbent on him to assume towards the younger lady, with whose undisguised warmth of feeling he seemed to be amusing himself a little unguardedly.

"Why, I am not going to maintain," he answered, "that the *literal* sense of the words is true.—I don't say, that every man has his price actually in pounds, shillings, and pence. But I think we can scarcely confute the assertion taken in a wider signification. I don't think we find many men who can resist temptation if only it assails them on their weak point, whatever that may happen to be. Most of the instances of heroic virtue concerning which society is eloquent seem to me to resolve themselves into this, that the man was tried where he happened to be strong, and so withstood the trial easily enough. A generous man is tempted to do a mean action—tempted, that is, by some arrangement of external circumstances which makes such an action easy and profitable. He does not do it, simply because he does not feel the slightest inclination to do it, and the world cries out in admiration. But let the same man be tempted to fly into a passion, and ten to one, he yields to the impulse without a struggle. The Tempter has only to pay his price, and he wins his prey immediately."

"This seems to me sophistical," said I; "but I am not logician enough to argue with you. According to this reasoning, I suppose that a man who had so schooled his mind as to make his impulses good instead of evil, would possess no merit at all."

"Pardon me," cried he, "I was speaking of real, modern, living men, such as we see around us. The character you describe is not to be met with among them—I was speaking of a man who is governed by his temperament—I should hardly venture to speak at all of one who had learned to govern it."

"You have a bad opinion of human nature."

"I have indeed," replied he, gravely, "a very high opinion of what it might be,—a very low opinion of what it is."

"And you do not believe in friendship?" exclaimed Miss Kinnaird; "that seems to me the strangest of all your opinions. I always thought there was so much real friendship among military men; there is such close and constant companionship, such unrestrained intimacy, such mutual dependence and forbearance. Why do you smile? I am sure it is the general rule—I am sure Frank thinks so."

"And so the tie which unites two red coats is in your eyes a holy and romantic thing! Forgive me if I say that seems to me the strangest of all your opinions. I should like to hear your notions of a military life."

"I ought to know something on the subject," answered she, colouring a good deal. "I am a soldier's sister."

"In the days of chivalry—in which you *ought* to have lived (you will at least agree with me in that)—such friendships as those which you are imagining to yourself, may have been common enough," observed Captain Everard. "Men to whom the profession of arms was a sacred thing, to be entered on with fast, prayer, and vigil, who had again and again faced death side by side, not with the bravado of physical indifference, but with the reverent fearlessness of Christian faith, whose vow of brotherhood was assumed before God, and blessed by the Church—don't you think such men as these must have been very nice!" added he, with a sudden change of tone and manner, as he encountered Edith's kindling eyes.

She made him no answer at all, and after a moment's pause he proceeded, "But what do you suppose is the progress of a friendship between two knights of modern times,—degenerate creatures that they are? It begins over the mess table, when the heart is warmed by a few additional glasses, and is in the most favourable state for the reception of a deep and lasting impression; it is cemented by sympathy and mutual assistance in practical jokes, and the noble contention of singletick; and, in the higher cases, though even these are by no means rare, the *friend*, emphatically so called, seals his devotion by becoming second in that rational and Christian recreation, a duel. A bond thus hallowed may naturally be expected to outlast time itself."

"Come, come, Everard, this won't do at all," cried Kinnaird, taking up the cudgels; "why, my dear fellow, your arguments are as flimsy as possible. I'll say nothing about your knights of old, though, if they began their friendships, as I dare say they did, over noble wine of Xeres, and cemented them at tilts and tournaments, I don't see why they need despise our mess tables and singletick. But if you mean to say, that there does not often exist between brother-officers a friendship as true, as refined, and as lasting, as can ever be met with in the world, I say you are mistaken. Why, you are yourself a proof to the contrary. Think what you have been to me!"

"My dear Frank," said Everard quickly, "I am arguing with the ladies; you are not to interest yourself in the matter at all. Besides, I am quite sure that I shall have Miss Kinnaird on my side here. I know, if she will only be so charitable to confess it, that she has a much higher opinion of the knights of old than of her Majesty's army at the present day. Now have you not, Miss Kinnaird?"

"If Edith would rather have a great murdering baron who could neither read nor write, than an accomplished, educated, rational man, I can only say she is very foolish," observed Kinnaird.

"You could not possibly say anything milder under the circumstances," returned his friend. "But I see I must take you home, where we can argue the question at our leisure. We are keeping the ladies up unconscionably late after your sister's fatigue."

Frank rose at this hint, and the gentlemen took their leave. "I am afraid I go away in disgrace," said Captain Everard, as he shook hands with me, "but you have a very charitable expression of countenance, and I shall trust to you, first to forgive me yourself and then to make my peace with that young lady, with whom I can scarcely venture to shake hands."

"If I thought you were really and thoroughly in earnest," rejoined she, doubtfully, "I should think a great deal worse of you than I do."

"Then I beg you will continue to suppose me in jest," cried he, as he quitted the room.

"That is a singular person," said I, when we were left alone. "Is he a very intimate friend of your brother's?"

"The dearest friend Frank has in the world," replied Edith; "I have been hearing Captain Everard's praises ever since he got his first commission; I believe he has a great many good qualities, and he has been invaluable

to Frank—and his conversation is interesting—one could not go to sleep over it as one so often feels inclined to do with commonplace people—but I cannot say that I like him."

"I should not like him for a friend," I observed cautiously.

"I dislike him excessively," cried she, with energy. And so we parted for the night.

What a number of little worlds revolve, unsuspected, under the uniform surface of that complex and mysterious thing, Society! The only words spoken that evening which had penetrated into my heart, and which remained there, were the careless expressions of Frank Kinnaird, "that he looked upon me as an old friend *because he had heard so much of me in his childhood.*" Amid the interminable musings which arose out of this little sentence, I fell asleep.

A CHRISTMAS PARTY IN THE COUNTRY.¹

CHAP. VIII.

A RAMBLE TO THE SYKE.

"PRAY, my dear mother, where did you and Justine ramble to this morning?" asked Charles Loraine, as the party at Kirkfield Hall drew near the blazing fire, and arranged the table and working-frames for the evening; "I came in, tired to death with hard study, to propose a walk, but found the girls all busy letter-writing, and you and my cousin vanished no one knew whither. Where did you go?"

"We went as far as the Syke," replied his mother, "because I wished to show Justine a specimen of our north-country farmhouses, and had not before been to partake of good Mrs. Fielding's yule-cake and cheese. You will all be in disgrace there if you do not go soon, for she says she has looked for you every day, and has made Justine promise to visit her again with you."

"Which I did promise most readily," said Justine. "Estrange," "for I was quite taken with the old lady's hospitality and homely good humour. Not that I am sure I understood all she said, for she certainly did speak more broadly than any one I have yet met with, when she 'wondered as hoo t' young ladies hed nivver been ower ta taste t' yule-cake, an' not even Mr. Charles hed been in wi' his gun ta hev a bit o' cheese an' a sup o' Christmas yall. She really thowt it war ower bad. They might as weel hev a barghest at Syke, ye all seemed as flayed ta cum till it."

"Well done, Justine!" cried Charles, "you will speak the real Doric in time."

"Is it not a shocking corruption of language?"

"I am not quite so sure of that, Mademoiselle. Modern English you know is said to be a corruption of the Saxon, and in our dales I doubt not you will find more words of pure Saxon origin than in any other district. We must introduce you to Dr. F., who will discourse most learnedly upon this topic, and doubtless tell you an anecdote of his younger days, when, meeting in a coffee-room at Rome with another daleman, they were both so rejoiced at the encounter that they sat down together, and talked long and loudly in their broadest mother-tongue, till interrupted by a very modest yet dignified-looking personage, who introduced himself as the celebrated Signor A., and said he had believed himself master of all European dialects, and many other languages, but was emboldened to intrude upon them to ask in what language they were conversing, as all his learning had not enabled him to guess at it. Dr. F. told him it was pure and uncorrupted English, which

was still preserved in some of the secluded districts of the north. The good doctor is half inclined to uphold his assertion even yet, nor am I sure if he be in jest or in earnest when he does so. But I am glad you like our friend Mrs. Fielding; she is a great favourite with my mother."

"She is one of an old-school class, now almost extinct," said Mrs. Loraine, "and I confess a favourite of mine. I like going to the Syke. There is always a hearty welcome, and no pretension, no aiming at refinement which would be out of place. We were indeed ushered into the best parlour, which Justine might think quite Frenchified, for there stands the best bed, exhibited with as much pride as a Parisian couch with its elegant drapery, though composed of rather more solid and substantial materials. There too is the corner-cupboard of black oak, standing open to display several pieces of fine old china, and a huge chest of highly polished and inlaid walnut-wood drawers, large enough to contain her fine stock of household linen, all spun by her own hands or those of her mother and grandmother. Mrs. Fielding herself, with her dark silk-handkerchief tied in this cold weather over her close widow's cap, her grave cotton gown, and checked apron, is quite in keeping with the homely but substantial look of all about her. From her I am sure to hear the best account of all the poorer neighbours, the truest and the kindest, nor do I think there is any one more ready to relieve their wants, in which she is always aided by her son, whose farm and dairy she helps to manage; and as constable, over-keeper, or churchwarden, William Fielding has long been the most useful man in the parish."

"She chiefly won my heart," said Justine, "by her remembrance of my mother, and by telling me I was like her, and that for her sake as well as for my own she was delighted to show me the treasures of her dairy, her poultry-yard, and her garden."

"It is a bad season for the garden," said Sophia; "but in the summer it is unrivalled not only in its profusion of roses, honeysuckles, and peonies, its tall willow herb and wide-spreading mignonette beds for her bees, but for its infinite variety of pot-herbs, on which she prides herself, and which you would doubtless remark hanging in bundles innumerable from the top of the room. It is a bad season for viewing the garden."

"Not so bad, Sophia," replied Justine, "but I met with a prize growing in a warm and sheltered corner near the wall, and brought away this sprig of rosemary in full bloom as a commencement for the herbal Agnes has been persuading me to attempt under her auspices. You will help me to-morrow, Agnes, will you not? and perhaps this flower will be a theme for what Charles calls our lecture to-night."

"Did Mrs. Fielding not tell you any of its virtues?" asked Lucy.

"Indeed she expatiated greatly on its valuable properties as a comforter to the heart, a strengthener of the memory, a cure for the headache, and a wash for the hair; and told me it is the chief ingredient in the far-famed Hungary water. Nay, she would hardly believe I did not pluck this sprig to make rosemary tea, and, blaming my excessive modesty, would fain have laden me with a huge bundle ready dried for the purpose."

"I thought she would not fail to recommend its good qualities."

"And pray, ladies," asked Frederic, "did not your memories want strengthening when you omitted to add rosemary to your rose-named flowers?"

"Our memories were not at fault, I can assure you, Frederic," answered Sophia, "for this plant does not derive its name from the rose. It is properly *rus*, and comes from the same root as *drosera*, which you may remember signifies dew. Rosemary is *Ros Marinus*, or the dew of the sea; and in its native country, the South of Europe, this plant grows so close to the sea-shore that it literally seems to receive its nourishment from its exhalations."

"It is altogether a poor dull-looking plant, and would hardly have claimed our notice at any other season of the year than this, when I suppose it is valued for the scarcity of other flowers."

"It has greater claims to our notice than this, Justine," said Mrs. Martha Lorraine; "and I think there are few plants which are invested with more pensive and poetic interest. You doubtless remember Ophelia's speech, 'There's rosemary, that's for remembrance'—and the quality so generally ascribed to it of serving to strengthen the memory makes it not only a favourite flower of rustic gallantry—a sort of forget-me-not—but seems to have hallowed it in a still more tender manner. It is peculiarly the flower of the dead in the estimation of many widely-differing parts of England. Amongst the fishermen of Yarmouth and other places on the coast of Norfolk, and also in Yorkshire, I have seen it strewn over the humble coffin, and laid in profusion around the church during a funeral; and in the churchyards of Wales, so celebrated for the beautiful custom which decorates them with flowers, the rosemary is a principal favourite, and sprigs of this plant are usually worn by mourners, and thrown into the grave as a last offering of affection."

"But, my dear aunt," said Charles, "pray remember that rosemary is, or was, also a country decoration for weddings, and as such is frequently named by our old English writers. Spenser, I think, calls it 'refreshing rosemary;' so do not let Justine look upon her first attempt to form an herbal as an ill-omened beginning. Agnes, when you were a little girl,—which I dare not call you now that you reach up to the shoulder of such a grenadier as I am,—you used to repeat a great part of Shenstone's 'Schoolmistress.' Can you remember the verse in which he celebrates the rosemary?"

"Oh dear!" said Agnes, "it is a very, very long time since I repeated that task, but I will try;" and with a little recollection she repeated—

"And here trim rosemarine, that whilom crown'd
The daintiest garden of the proudest peer,
Ere driven from its envied site, it found
A sacred shelter for its branches here;
Where edged with gold its glittering skirts appear.
Oh wassel days! oh customs meet and well!
Ere this was banished from its lofty sphere;
Simplicity then sought this humble cell,
Nor ever would she more with thune and lordling dwell."

"Shenstone's 'Schoolmistress' must have been an ancestress of Mrs. Fielding's," said Lucy; "since in her garden were to be found 'herbs for use and physic not a few;' but look at your flower, Justine, and see if it has not a bright edging to its dull petals, which the poet so prettily calls its glittering skirts."

"You see, Justine," said Charles, "your flower is not so despicable as you were inclined to suppose; and I dare say other quotations may be brought forward in its favour."

"I think," said Cyril, "I have read that in the Great Desert many stalks of rosemary and lavender are found, though it is not known whence they spring; and to this Moore is supposed to allude when he calls this plant—

'The humble rosemary,
Whose sweets so thoughtlessly are shed
To scent the desert and the dead.'

"I was going to tell you the rosemary is a most useful plant in some parts of India, where it is commonly burnt as fuel; but I remember, in time to save that blunder, that it is a species of artemisia or southernwood which is there used, and that the strong scent and smoke were among the minor distresses suffered by the heroic Lady Sale and other prisoners during their most disastrous captivity in the Afghan war."

"Mr. Cyril," said Charles, "I will quote a still more sentimental poet than yours. Though his name is Gay, his subject is most dismal, and he quite coincides with Aunt Martha's account of the plant in his most affecting description of the funeral of Blouzelinda:—

'To shew their love, the neighbours far and near
Followed, with wistful look, the damsel's bier.
Sprigged rosemary the lads and lasses bore,
While dimly the parson walk'd before:
Upon her grave the rosemary they threw,
'The daisy, butter-flower, and endive blue.'

"Do you not think," asked Mr. Barlow, "that this custom of strewing rosemary at funerals may have arisen from the aromatic properties of the plant, which might be supposed beneficial in preventing any infection or unpleasant effluvia from the corpse? The essential oil expressed from it is peculiarly fragrant."

"Such an idea has been before suggested, and is supported by the French name *encensier*, or incense-plant," replied Mrs. Martha; "but I am always inclined to adhere to a poetical explanation, and the more so in this instance, as there seems to be some superstitious interest attached to the plant in other countries. I was struck the other day, on reading the narrative of a modern traveller in Spain, to find him mention the rosemary being worn round the hat of a Spanish contrabandista as a charm against witches or mischances on the road."

"Might not that idea of protection be suggested by its name, Mary," rejoined Mr. Barlow, "which, as applied to many flowers, shows them to have been dedicated to the Blessed Virgin?"

"Rosemary is not one of those; for, though it is supposed to have been introduced into this country by the monks of the early ages, yet, as Sophia has told us, its name has a different origin; nor has its Spanish name any connexion with the Virgin Mary. Mr. Barrow mentions it as Romero, and I believe we must trace the feeling with which it is regarded to a more remote era, for the same author expresses his belief that it is of Scandinavian descent, and may have been introduced into Spain by the Vandals."

"My dear aunt, you are carrying us far away indeed," cried Cyril. "Let me bring back the discourse at least to the middle ages, and inquire something of the many flowers which Mr. Barlow speaks of as dedicated to the Virgin?"

"I think I must refer you to Rose and Lucy," said Mr. Barlow, "for I remember they were much amused by the account they received from an old Romanist, whilst they were visiting at Clifton Park."

"Indeed the good old gentleman entered most kindly into our floral pursuits," said Lucy; "and, though no botanist, brought what he could to our common stock of amusement, by tracing the origin of many of our popular names for plants to the old monkish times, and teaching us to look back to the inhabitants of our beautiful and ruined monasteries, as in those times the preservers of science as well as of religion, and as blending the one with the other in fantastic and poetic formulae, making the flowers of the field a rural calendar of the church, by dedicating to each saint such flowers as appeared in bloom the nearest to their festivals. Even to our favourite snow-drop, he gave us a new title, and said that, in ancient days, it was known as 'the fair maid of February,' because it blows about the second of that month, which is the feast of the Purification of the Virgin, or Candlemas-day, and may well be a type of virgin purity."

"On this subject," said Rosaline, "Mr. Selby was quite an enthusiast; and, during our morning's walk to the ruins of St. Werberg's priory, was delighted to discover the Geum Nivale, or herb St. Bennet, and afterwards to point out the elegant form of its leaves, in the beautiful tracery of the capitals and other parts of the building."

"I think he was still more delighted," said Lucy, "to find a poor straggling plant of monk's-hood, or wolf's-bane, amongst the ruins, and to expatiate upon the valuable knowledge of the Benedictines, who could draw healing virtue from the most dangerous herbs, and

had applied even the monk's-hood as a remedy for some diseases."

"Oh! I remember hearing you tell us of that," interrupted Agnes; "and you know James Hamilton wrote a charade upon it. I have it just here in my scrap-book: pray let me read it to Mrs. Barlow, and Justine, and Frederic."

"I shall proclaim silence in the court whilst Agnes reads," exclaimed Frederic; "since it is avowedly for my edification." And Agnes began:—

"It is night, dusky night, and the moon shines bright
On the walls of the abbey gray;
Whence my *first* steals forth 'neath her tender light
And weids his silent way.

"His footsteps sound on the echoing ground,
As he paces the cloisters dim;
The wind whistles shrill, and he feels 'its chill
Creep over each aged limb.

"Yet he lingers there in the midnight air,
And draws my *second* down
O'er the scanty locks of snow-white hair
Which fringes his shaven crown.

"Then forth he treads, where the moonbeam sheds
Its silvery light, and pours
With the falling dew o'er the garden beds
Fresh beauty for their flowers.

"There rue and balm, in the moonlight calm,
Their fragrance distil,
And that brother's eye can well descry
Each herb of good and ill.

"With a mournful air my *whole* grows there,
Dread plant of baleful power!
Yet to gather its leaves is that brother's care
In the mystic midnight hour.

"And he crosses his brow, and murmurs low
A prayer that the holy rood
May bless the use of that dark herb's juice,
And extract from all evil good."

"Thank you, Agnes," said her cousin; "your riddle might have been more difficult to be guessed, had you not told us beforehand what gave rise to it; but let me ask Sophia what is the botanical name for this plant, and why it has acquired those of wolf's-bane and monk's-hood?"

"I need only show you my drawing, and point out the peculiarly hood-like shape of the flower, to account for one name," replied Sophia. "Wolf's-bane, I suppose, alludes to the very fearfully poisonous qualities which reside in every plant of the whole species, and are so powerful as to destroy the strongest animals; indeed old Gerarde says, the plant was anciently placed in pieces of raw meat, and laid where wolves were known to resort, in order that they might be destroyed by eating it. Gerarde also calls it the helmet-flower, and in Germany it is called Hurmhut, both which names plainly allude to the shape of the flower. Its botanical names are *Aconitum Napellus*, the former derived from the town of Acona in Bithynia where it abounds, the latter—the trivial name which distinguishes it from others of the same species—from *napus*, a turnip, because the roots resemble small turnips."

"I think, Sophia," said her father, "since you do quote old Gerarde so often, you ought to enlighten us as to the antidote he sets forth against the poison of the monk's-hood. He says cattle and other beasts will eat the grass around the roots, but never touch the herb itself, which is shunned by all living creatures, except certain flies, who feed upon it with impunity; and he recommends a dose of twenty of those flies as a remedy to those who may incautiously taste of it."

"First catch your flies, I suppose," said Charles, laughing. "For my part, I would as soon trust to the garland of rosemary as a charm against witches."

"Our friend Gerarde, whilst he warns us against the credulity of others, is certainly given to the same folly

himself; but the march of intellect had scarcely begun in his days, and he must be honoured for even the short step he has achieved."

"Sophia still stands up for her old friend, I observe," said Cyril; "but I have not yet got a list of the plants dedicated to the Virgin. Virgin's bower, I suppose, is one?"

"Yes, and we have also our lady's mantle, alchemilla; lady's traces, or tresses, *spiranthes æstivalis*; lady's slipper, *cypridium calceolus*; with others, all of which Mr. Selby told us were anciently dedicated to the Virgin."

"And to these," said Justine, "I am proud to be able to add *Les gants de Notre-Dame*, which I think is called in England the foxglove."

"The beautiful foxglove," exclaimed Rose. "I am quite glad, Justine, to have another name for it; another recollection to attach to the noble flower which always seems to me to blossom in the waste and deserted places, and erect there its stately head, as if to show that worth and beauty may be found far from the busy haunts of men; and when I have seen it bow beneath the passing gale, and then rise again with its beauty unimpaired, it has seemed a type of some noble spirit which wisely bows to the light humour of the moment, but soon reclaims its inherent superiority."

"My associations with the foxglove," said Lucy, "are not half so full of moral, but I am sure they are quite as poetical as Rosaline's, for I always think of the pretty name by which the village children call it—'fairy thimbles'—and fancy I can see the tiny elves peeping out of the bells—one hiding itself far in the interior, from the pursuit of its companions, who are flitting around in merry search; another greedy imp devouring the honey stored away in some secret cell; and a third, with the gravity of a philosopher, counting the stars, noting down on a lily leaf the number and situation of the spots which decorate its petals."

THE VOYAGE TO ENGLAND.

OUR voyage across the Atlantic had been eminently prosperous. From our departure from New York, August 1, 1840, we encountered no obstruction, during the seventeen days that brought us to the Irish coast. Our good ship, the *Europe*, Captain Edward G. Marshall, surmounted the waves buoyantly, and often seemed to skim their surface, like a joyous bird. We almost imagined her to be conscious of the happiness she imparted, as seated on the deck, in the glorious summer moonlight, we saw her sweeping through the crested billows, with a pleasant rushing sound, right onward in the way she ought to go.

Thus were we cheated along our watery way; and, by making the most of the scenery without and the resources within, experienced as little ennui as could be expected, and indulged in no anticipation of evil. But that terror of mariners awaited us in St. George's Channel—a dense fog upon an iron-bound coast. We had joyfully seen the light in the head of old Kinsale; afterwards, the harbour of Cork and the mountains of Dungannon revealed themselves, and were lost. Then wrapped in a thick curtain, we went on fearfully with continual soundings. A chill rain occasionally fell; and the winds moaned and cried among the shrouds, like living creatures. The faithful and attentive Captain, oppressed with a sense of his responsibility, scarcely took refreshment or repose. At midnight, on the 19th, we heard his voice cheerfully announcing, that a bright light from Tuscar Rock was visible, that our course was right, and that all might retire to rest, free from anxiety.

As morning dawned, I lay waking, and listening to sounds that seemed near my ear, and even upon my pillow. They were like water forcing its way among obstructions, or sometimes as if it were poured hissing upon heated stones. At length I spoke to the friend who shared my state-room, of a suppressed voice of eddies and whirlpools, like what is often heard in passing Hell Gate, when the tide is low. She thought me imaginative; but on hearing that I had long been reasoning with myself, and yet the sounds remained, she threw on her dressing-gown, and ascended to the deck. The fog was still heavy, and all things appeared as usual. Soon the carpenter, being sent aloft to make some repairs, shouted, in a terrible voice, "Breakers! breakers!" The mist lifted its curtain a little, and there was a rock, sixty feet in height, against which the sea was breaking with tremendous violence, and towards which we were propelled by wind and tide! At the first appalling glance, it would seem that we were scarcely a ship's length from it. In the agony of the moment the Captain, clasping his hands, exclaimed that all was lost. Still, under this weight of anguish, more for others than himself, he was enabled to give the most minute orders with entire presence of mind. They were promptly obeyed; the ship, as if instinct with intelligence, obeyed her helm, and sweeping rapidly around, escaped the jaws of destruction. Still we were long in troubled waters, and it was not for many hours, and until we had entirely passed Holyhead, that the Captain took his eye from the glass, or quitted his post of observation. It would seem that, after he had retired to rest the previous night, the ship must have been imperfectly steered, and aided by the strong drifting of the tides in that region, was led out of her course towards Cardigan Bay; thus encountering the reef which is laid down on the charts as Bardsey's Isle.

The passengers, during this period of peril, were generally quiet, and offered no obstruction, through their own alarms, to the necessary evolutions on deck. One from the steerage, an Irishman, who had been thought, but a few days before, in the last stages of pulmonary disease, was seen in the excitement of the moment labouring among the ropes and blocks, as if in full health and vigour. It was fearful to see him, with a face of such mortal paleness, springing away from death in one form, to meet and resist him in another. Every circumstance and personage, connected with that scene of danger, seem to adhere indelibly to recollection. A young girl came and sat down on the cabin floor, and said in a low, tremulous tone, "I have loved my Saviour, but have not been faithful to Him as I ought;" and, in that posture of humility, awaited his will. A mother, who since coming on board had taken the entire charge of an infant, not a year old, retired with it in her arms to a sofa, when the expectation of death was the strongest upon us all. Masses of rich black hair fell over her brow and shoulders, as her eyes were rivetted upon the nursing, with whom she might so soon go down beneath the deep waters. He returned that gaze with an almost equal intensity, and then they sat uttering no sound, scarcely breathing, and pale as a group of sculptured marble. His large, dark eyes seemed to cast—

"Not those baby looks, that go
All unmeaning to and fro;
But an earnest gazing deep,
Such as soul gives soul at length,
When through work and wail of years
It hath won a solemn strength."

In that strange communion, was the mother imparting to her nursing her own speechless weight of agony, at parting with other beloved objects in their distant home?

Or did the tender soul take upon itself a burden, which pressed from it a sudden ripeness of sympathy?

Or was the intensity of prayer drawing the spirit of the child into that of the mother, until they were as one before God?

Strong lessons were learned at an hour like this. Ages of thought were compressed into a moment. The reach of an unbodied spirit, or some glimpses of the power by which the deeds and motives of a whole life may be brought into view, at the scrutiny of the last judgment, seemed to reveal itself. Methought the affections, that so imperatively bind to earth, loosened their links in that very extremity of peril; and a strange courage sprang up, and the lonely soul, driven to one sole trust, took hold of the pierced hand of the Redeemer, and found it strong to save. — *From Mrs. Sigourney's "Pleasant Memories of Pleasant Lands."*

THE TRUE HEIR.

MANY centuries have passed since Theophilus was Emperor of Rome, whose Empress was Pulcheria, the beautiful daughter of the King of Hungary. Beautiful indeed in form, and engaging in converse and manner, Pulcheria was far from true and faithful to her lord the Emperor, and great and constant doubts were always entertained of the legitimacy of the four sons, the princes of the empire.

During the lifetime of Theophilus constant dissensions arose between the three elder princes, who seemed to recognise but one bond of union, hatred and opposition to their father and their younger brother Charis. He alone was dutiful and obedient to his parents. Many a war was begun between the brothers, many a hollow truce made, and many an act of treachery practised against one another, as well as against the aged Emperor. Charis alone sided with his father, and was his defender in the battle-field, his comforter in distress, his counsellor in difficulty.

At last the old Emperor died, and was buried in the sepulchre of his fathers, and no one knew who should succeed him. Hardly had the funeral procession ceased from crowding the streets of the imperial city, or the echoes of the solemn hymn died away in the sanctuary where his corpse was laid, ere the trumpets sounded to arms, and the three elder sons of the Emperor were in open warfare for his vacant throne.

Many adherents flocked to each standard, allured by the prospect of spoil and cruelty, and the empire was threatened on every side with desolation and suicidal war. The apparent equality of the contending forces, and the firm determination shown by the great and good lords of the kingdom, not to admit even the successful combatant to the crown, except under the strongest bonds for his good government, disposed the brothers to defer the question to arbitration.

On an appointed day, the three elder brothers, each accompanied by two armed followers alone, met in the great meadow of the old Campus Martius, before the assembled multitudes that stood in masses around on every side. Then the

prefect of the city advanced before the multitude, and asked them why they came.

"We are come," rejoined the brothers, "to defer our claim to the imperial crown to the judgment of the wisest man in Rome—the Senator Senex."

"There yet lacketh one among you—your youngest brother Charis."

"Let him come," rejoined the brothers—"he, too, shall abide by the judgment of Senex."

Then Charis stepped from the crowd, and joined the circle of the great men that stood with his brothers.

"Princes," said the prefect, amid a solemn silence, "are you content to swear by God's holy Gospels, that you will each and every one abide by the judgment of the Senator Senex?"

"We will," replied the princes.

"Will you promise and swear—each for himself—that if you be chosen by him as Emperor, you will faithfully fulfil the imperial duties, and honorably justly, and truly govern your people?"

"We will."

"Will you, O princes,—each for yourselves—promise and swear, that such of you as shall be rejected by the decision of Senex, will do and pay due and proper and true allegiance to that one of you who shall be chosen as Emperor?"

"Verily and truly will we," rejoined the brothers, each in his turn reverentially kissing the holy book in token of his calling God to witness his oath.

"Citizens and people," said the prefect, turning to the vast multitudes, "ye have heard the oaths of the princes, are ye content to abide by the decision of the Senator Senex, and to obey as your Emperor the prince whom he chooses?"

"We are content—we are well content," cried the people.

"Good and wise father," continued the prefect, turning to Senex where he stood by the princes, "the people and the Emperor's sons are alike content to abide by your decision. Come then, father, tell us who is the legitimate heir of the great king."

"Then," said Senex, "princes, senators, nobles, and people, hear my words: Long have we all doubted which of the Emperor's sons was his legitimate heir. Go to now—open the grave of our late lord and master, take from thence his body, and bind it to yonder tree."

A cold shudder ran through the assembly, and not a word was spoken; for they feared his words, and yet dreaded to obey them.

"Let the princes prepare each his bow and each his arrow," continued the old man, "and with his single shaft let him shoot from here at the body of his father, and he that striketh nearest to his father's heart's core—let him be king."

With a strange sense of fear, and a solemn and imposing silence, the people bowed assent to the advice of Senex, and hastened to execute his commands. The three elder brothers busied themselves about their bows and arrows, carefully examined and tried their weapons, and measured with anxious steps the distance between the tree and the spot whence they were to shoot at their father's dead body. Charis stood unmoved and rooted to the spot, and, when his servant laid his bow and arrow at his feet, he gave but one look at the weapons, and then burst into a flood of tears, and covered his face with his hands.

At length the corpse of the Emperor was borne into the midst of the assembly, and tied with cords to the tree, whilst the eldest brother hastened, with a glistening eye and nervous hand, to take his station at the appointed spot. At the given signal his arrow sped from the bow, and stood transfixed in the right hand of his father's corpse. With a shout, the fickle crowd celebrated his success, and hailed him as their new Emperor.

But the second son now hastened to the spot, and carefully assayed himself to the horrible trial. Anon his bow twanged, and the arrow flew towards the tree, and the plaudits of the crowd hailed his success, when its slender reed quivered in the very breast of his father.

The third son moved forward; his look was calm and determined, as with care he scanned the object of his mark, and poised his bow, and glanced along his arrow to the maimed body. At the given signal the arrow flew, and the very heart of his father was cloven by its head. Little doubt could there now be of his success, and again and again the crowd hailed him as Emperor.

With his head bowed to his breast, his eyes drowned with tears, and his bow trembling in his hand, Charis crept towards the appointed spot, amid the jeers of the people, and the regrets of the wise and good among the senators and nobles. For a few moments he stood erect, looked upon his father's mangled body, poised his bow and fitted his arrow to the string. But the effort was but momentary, again his hands dropped helpless by his side, and his head declined on his youthful breast.

"Prince Charis," said the prefect, "the trial awaits you,—are you prepared?"

One look Charis turned towards the prefect, one look he turned towards the fatal tree, and then, with a cry of agony, casting away his bow and arrow, he sprang towards it, clasped the corpse in his arms, drew the arrows from the flesh, and bathed the wounds with repeated kisses.

"Prince Charis,—Prince Charis," again repeated the prefect, "the trial awaits you." But his words were unheeded.

"Oh, my father," exclaimed the prince, standing reverentially before the corpse, "My father!—my poor father!—have I then lived to see you the victim of an impious contest? What! can thine offspring lacerate their father's flesh?—far, oh far be it from me, to raise my hand against thee alive or dead!"

"The right heir!—the true king's son!—he is our Emperor," burst on all sides from the people; "away with the others—away with them—he is our Emperor."

"Romans," said Senex, waving with his hand to command silence—"my device has succeeded—the right heir is found—he is your Emperor."

There was no one to gainsay the people's choice and the people's judgment. The three elder brothers were seized and hurried to prison, there to atone in solitude and misery for their sins; whilst Prince Charis was hastily borne on an uplifted shield towards the capitol, and enthroned as Emperor, amid the joy and plaudits of his people.

Poetry.

In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.

THE YOUNG MAN AND THE FRIAR.

From the German:

THIR convent bell hath summoned
The father to the gate,—
"Who stands without, disturbing
Our rest at hour so late?"
A youth is humbly kneeling,
"God grant thee, father, peace!
I seek thy holy dwelling,
Here may my sorrows cease!"
"The world which I am leaving,
Is never free from care;
The thorn, the yew, the cypress,
Cast gloomy shadows there;
Scorn, hatred, and repining,
Have long my soul possessed;
Flying earth's baneful circles
I come to thee for rest."

FATHER.

"Not so, pale youth, this yearning
Is but befitting those,
Who, faint from life's long journey,
Covet the grave's repose.
Thy path is upward tending,
Through sunshine and through shade;
By such unmanly weakness
Let not thy steps be stayed."

YOUTH.

"My parents both are sleeping
Beneath the earth's green breast;
Would that I lay beside them,
A sharer in their rest!
The friend I deemed most faithful
The holiest trust betrayed;
And she I loved so fondly
With scorn that love repaid.
Hope's violet hue hath faded
'Neath sorrow's scorching sky;
Stained is the lily's whiteness
'Mid earth's impurity;
Joy's brightest rose hath withered,
Nought leaving but the thorn;
O close not thou thy portals
Upon a wretch forlorn!"

FATHER.

"Nay, wherefore thus despairing?
The faded flowers rebloom;
Deem not the chequered sunshine
An everbiding gloom;
Evil and good are blended
By Him who reigns on high;
Then strive not thou, rebellious,
A mortal's lot to fly."

YOUTH.

"I know that light unfading
May not on mortals shine;
But, ah! their darkest portion,
Unbroken night, is mine!
Within this sacred cloister,
Hope's star may yet appear,
For clouds of earthborn sadness
Cannot obscure it here."
Yet still the old man firmly
The youth's request denied,
And to his pleading urgent
He ever thus replied:—
"God hath thy sphere appointed,
He doth thy lot dispose,
He knoweth well thy weakness,
And he can grant repose."

(1) See Illustration, p. 257.

"Then strengthen thou thy spirit,
And to the world return,
Thy duty lies before thee,
Patience and faith to learn;
And when thy task is over,
And thy last sleep is slept,
What will it then betide thee,
That thou hast smiled or wept?"

Miscellaneous.

"I have here made only a nosegay of culled flowers, and have brought nothing of my own, but the string that ties them."—*Montaigne.*

ARDEN AND PITT.

IN private life Lord Alvanley appears to have been an object of general affection and esteem. The absence of all pretension and reserve, which made his appearance in public to be, as it were, in undress; his openness and simplicity; the warmth with which he espoused the interests of his friends, and the heartiness which he threw into all social pleasures, could not but place him high in favour with the domestic circle. *J'aime ce joli musique*, seemed to be his motto, even when his own peccadilloes or mishaps might form the subject of merriment. His manners were neither flippant nor inelegant in private society. He had an exuberance of spirits; and his conversation is described to have been so entertaining, that Pitt rarely dined at a party when Arden was there without making a point of sitting next to him at dinner. We may well fancy how much the minister, who generally spoke in the state-paper style, and conversed in periods—diffident, proud, and reserved—must have enjoyed the force of contrast in his rattling, careless negligence, and that the discords, taken together, "discoursed most eloquent music." With such a companion (we are assured by one who knew Pitt well,) free from shyness, and throwing off restraint, he was the wittiest companion, and the soul of merriment; "one of a joyous party who went to spend an evening at the Bear's Head, Eastcheap, in memory of Shakspeare, the readiest and most apt in the required allusions." How little could members of the House of Commons imagine that the precociously grave premier, who strode to his seat with chin erect and haughty sternness, could, with his friends, be guilty of sowing garden-beds with the fragments of a friend's dress opera-hat; or, armed with billhooks, cutting avenues through the coppice, and making the woods ring again to the merry laugh of the woodman. It required the revelations of lady Stanhope, the memoirs of Wilberforce, and the diaries of Lord Malmsbury, to make posterity render a tardy justice to the social excellencies of Pitt.—*Townsend's Lives of Eminent Judges.*

Norham Castle.

BERWICKSHIRE, as might be expected from its position as a border county, has been the scene of much predatory warfare; and many are the tumuli, cairns, military stations, and ruined castles, to be found in its various parishes. It is interesting to wander among such memorials of the past, if it have but the effect of bringing the distractions of war in distant ages, in contrast with the blessings of our own pacific times. Crumbling ruins are, indeed, the keystone, the dry bones, of history, which it requires but the power of association to invest with new life, and to clothe with almost illimitable interest.

Of all those border antiquities, "Norham's castled steep" is one of the most picturesque, as well as important. This ruinous fortress is situated on the southern bank of the Tweed, about six miles above Berwick, and where that river is still the boundary between England and Scotland. There is not, perhaps, more memorable battle-ground in the kingdom than this spot; and how grateful to the well-regulated mind is it to reflect, that whilst man's strife has swept away thousands of his species, and dyed with his blood the waters of

"Tweed's fair river, broad and deep,"

the stream has held on its course, mirroring on its surface the ruins which time has spared from the great wreck, and presenting to the student of humanity an emblem of his fleeting life, and the rapidity with which it passes to the sea of eternity.

The extent of the ruins of the Castle of Norham,

VOL. III.

(anciently called Ubbanford,) as well as its historical importance, show it to have been a place of magnificence, as well as strength. Edward I. resided there when he was created umpire of the dispute concerning the Scottish succession. It was repeatedly taken and re-taken during the wars between England and Scotland; and, indeed, scarce any happened in which it had not a principal share. It is situated on a steep bank, which overhangs the river. The repeated sieges which it had sustained, rendered frequent repairs necessary. The present castle was commenced by Ranulph, bishop of Durham, in 1121. In 1170—1174, it was strongly fortified by Hugh du Puiset, another bishop of Durham; and some circumstances relating to the work and the architect will be found in *Reginald of Durham*, capp. xlvii. and liv. This bishop added the huge keep; notwithstanding which, King Henry II. in 1174, took the castle from the bishop, and committed the custody of it to William de Neville. After this period, it seems to have been chiefly garrisoned by the king, and considered as a royal fortress.

In the reign of Edward the Second, was performed before Norham Castle that chivalrous feat which Bishop Percy has woven into his beautiful ballad, "the Hermit of Warkworth." The story is thus told by Leland:—

"The Scottes came yin to the marches of England, and destroyed the castles of Werk and Herbol, and overran much of Northumberland marches:

"At this tyme, Thomas Gray and his friendes defended Norham from the Scottes.

"It were a wonderful processe to declare what mischiefs came by hungere and asseges by the space of xi yeres in Northumberland; for the Scottes became so proude after they had got Berwicke, that they nothing esteemed the Englishmen.

"About this tyme there was a greate feaste made yn Lincolnshire, to which came many gentlemen and ladies; and amonge them, one lady brought a heaulme for a man of were, with a very riche creste of gold, to William Marmion, knight, with a letter of commendment of her lady, that he should go in to ye daungerest place in England, and ther to let the heaulme to be seene and known as famous. So he went to Norham; whither, within four days of cuning, cam Philip Moubay, guardian of Berwicke, having yn his hand 40 men of armes, the very flour of men of the Scottish marches.

"Thomas Gray, captayne of Norham, seynge this, brought his garrison afore the barriers of the castel, behind whom cam William richly arrayed as al glittering in gold, and wearing the heaulme, his lady's present.

"Then said Thomas Gray to Marmion, 'Sir Knight, ye be come hither to fame your helmet: mount up on your horse, and ryde lyke a valiant man to your fecs, even here at hand; and I forsake God if I resene not thy body dende or alyve, or I myself wyl dye for it.'

"Whereupon he toke his cursere and rode among the throng of cunemyes; the which layed sore stripes on him, and pulled him at the last out of his sadel to the grounde.

"Then Thomas Gray, with al the hole garrison, lette prick yn among the Scottes, and so wondid them and their horses, that they were overthrowan; and Marmion, sore betan, was horsid agayn, and with Gray, persewed the Scottes yn chase. There were taken fifty horse of price; and the women of Norham brought them to the foote men to follow the chase."

The Grays of Chillingham castle were frequently the castellans or captains of the garrison. Yet, as Norham was situated in the patrimony of St. Cuthbert, the property was in the See of Durham till the Reformation. After that period, it passed through various hands.

At the union of the crowns, it was in the possession of Sir Robert Carey, (afterwards Earl of Monmouth,) for his own life, and that of two of his sons. After King James's accession, Carey sold Norham Castle to George Holme, Earl of Dunbar, for 6000*l*.

We now approach an era in the history of the castle, which poetry has invested with interest of no common order; we mean, in Sir Walter Scott's vivid romance of "Marmion," a tale of Flodden Field, the fate of the hero being connected with that memorable conflict. Lord Marmion, the principal character of the poem, it is true, is entirely a fictitious character; but nothing can be more strikingly picturesque and life-like than the two opening stanzas of the romance, in which the feudal fortress is thus painted:

"Day set on Norham's castle steep,
And Tweed's fair river, broad and deep,
And Cheviot's mountains lone;
The battled towers, the donjon keep,
The loop-hole grates, where captives weep,
The flanking walls that round it sweep,
In yellow lustre shone.
The warriors on the turrets high,
Moving athwart the evening sky,
Seemed forms of giant height:
Their armour, as it caught the rays,
Flashed back again the western blaze,
In lines of dazzling light.

St. George's banner, broad and gay,
Now faded, as the fading ray
Less bright, and less, was hung;
The evening gale had scarce the power
To wave it on the donjon tower,
So heavily it hung.

The scouts had parted on their search,
The castle gates were barr'd;
Above the gloomy portal arch,
Timing his footsteps to a march,
The warrior kept his guard,
Low humming, as he paced along,
Some ancient border-gathering song."

In the first canto of the poem, various other features of the frowning fortress are glanced at, thus:

"Beneath the sable palisade,
That closed the castle barricade;"

and—

"Then to the castle's lower ward,
Sped forty yeomen fall,
The iron-studded gates unbarr'd,
Raised the portcullis' ponderous guard,
And let the drawbridge fall."

We now return to matter-of-fact record. According to Mr. Pinkerton, there is, in the British Museum, a curious memoir of the Dacres on the state of Norham Castle in 1522; not long after the battle of Flodden, fought on the banks of the Till, near Branxton, where the Scottish king was encamped before the action. In the above memoir, the inner ward and keep are represented as impregnable; and we find the following note of the interior economy: "The provisions are, three great vats of salt cels, forty-four kine, three hogsheds of salted salmon, forty quarters of grain, besides many cows, and four hundred sheep lying under the castle-wall nightly; but a number of the arrows wanted feathers, and a good Fletcher (i.e. a maker of arrows) was required."—*History of Scotland*, vol. ii. p. 201, note.

The ruins of the castle are at present considerable as well as picturesque. They consist of a large shattered tower, with many vaults, and fragments of other portions, enclosed within an outward wall of great circuit.

As Norham castle was built between 1121 and 1171, it must have presented a fine specimen of the Anglo-Norman fortress; though Bishop Puiset's addition carries us on to the reign of Henry II., one of whose first acts was to prohibit the erection of any castles without a licence. The Norman Conqueror, to secure his newly-acquired dominions, as well against invasions from without as rebellions within, lost no time in erecting strong castles in all the principal towns of his kingdom; and William's followers, to protect themselves against those whom they had despoiled of lands, imitated their master's example, by building castles on their estates. The turbulent and unsettled state of the kingdom during the succeeding reigns, caused the rapid multiplication of these strongholds; so that, at the latter end of the reign of Stephen, there are said to have been no fewer than 1115 castles completed in England alone. "The whole kingdom," says the author of the Saxon Chronicle, "was covered with them, and the poor people worn out with the forced labour of their erection." It was soon found that they were likely to be no less inconvenient to the sovereign, enabling a cabal of barons to beard the power of their liege lord; and hence the prohibitive enactment by Henry II.

"Many of the castles of this age," says an ably-written paper in the *Quarterly Review*, (attributed to Sir Walter Scott,) "were of great size, and possessed a certain rude grandeur of design. To the single keep-tower of earlier date, several other towers, both round and square, were added, united by flanking walls, so as to enclose a polygonal court yard, the entrance to which was usually between two strong contiguous towers. An outwork, called the barbican, often still further defended the approach, as well as a moat and drawbridge. Plates of iron covered the massive doors, in front of which the grated portcullis was let down through deep grooves in the stone-work; and overhead projected a parapet resting on corbels, between which were the openings called machicolations, from which

melted lead, hot water, and stones could be thrown on the heads of the assailants who should attempt an entrance by forcing, or, as was the usual mode of attack, firing the doors. The keep, or stronghold, (such as that added by Bishop Puiset, at Norham,) rose pre-eminently above the rest, and generally from an artificial mount. It contained the well, without which the garrison would not have been able to hold out in this their last place of refuge; *the donjon, or subterranean prison, the name of which was often extended to the whole keep*; and several stories of apartments, which were probably not occupied by any but retainers, except during a time of siege."

Sir Walter Scott, as we have seen, uses the term "donjon keep" and "donjon tower," in "Marmion," and we subjoin the following note:

"It is perhaps unnecessary to remind my readers, that the *donjon*, in its proper signification, means the strongest part of a feudal castle, a high square tower, with walls of tremendous thickness, situated in the centre of the other buildings, from which, however, it was usually detached. Here, in case of the outward defences being gained, the garrison retreated to make their last stand. The donjon contained the great hall and principal rooms of state for solemn occasions, and also the prison of the fortress; from which last circumstance we derive the modern and restricted use of the word *dungeon*. DuCange, (*voce* Dunjo,) conjectures plausibly that the name is derived from those keeps being usually built upon a hill, which in Celtic is called *Dun*. Barlowe supposes the word came from the darkness in the apartments in these towers, which were thence figuratively called dungeons; thus deriving the ancient word from the modern application of it."

Still, we find the word thus used by Spenser:

"Then up he took the slumber'd senseless corse,
And, ere he could out of his swoon awake,
Him to his castle brought with hasty force,
And in a dungeon deep him threw without remorse."

The application of the term *donjon* exclusively to the tower portion of the castle is strangely at variance with the French explanation. Baye defines *donjon* to signify, "*la partie la plus élevée d'un château*; a tower or platform in the midst of a castle; *espèce de cabinet dans les bâtimens particuliers au-dessus de la couverture*; a turret or closet, raised on the very top of the house; or what is commonly called the lantern. Walpole has used the word in this sense, in his "Anecdotes on Painting;" when mentioning the state of painting from the reign of Henry III. to the end of Henry VI., he says, "No wonder that a proud, a warlike, and ignorant nobility encouraged only that branch, (of painting on glass,) which attested their dignity: their *dungeons* were rendered still darker by their pride;" Walpole evidently intending to have written *dungeons* or *donjons*. (See *Lemon's English Etymology*.)

THE BLACK POTATOES.

An Irish Tale.

BY MRS. HOARE.

In former years it was a pleasant thing to take a summer ramble through the shamrock-covered fields, and among the wild mountain districts, of the green isle. To be sure, the features of the scenery were not so bold and striking as those of the Scotch Highlands, nor did the country present that aspect of rich and high cultivation that distinguishes the rural districts of "Merrie England" from those of all the world beside: yet many and abounding were the points of interest that caught the tourist's attention, including the humours of the light-hearted Irishman, as well as the romantic beauties of his land.

Among the more homely and characteristic charms of the latter, the stranger seldom failed to notice wide

districts covered with the rich green leaves and star-shaped purple-and-white flowers of the potatoes, which, in the months of August and September, were wont to render the island one fragrant garden, and hold out the prospect of winter plenty to the poor dwellers in the road-side cabins, whose most valuable possession was frequently the large iron pot, in which they boiled their sole and simple food.

But what a change has the present year¹ brought! Nothing in autumn was to be seen save black withered stalks, exhaling a most offensive odour. I have been lately sojourning in a remote district of Munster, and there I have seen a ghastly famine-stricken figure, feebly wielding a spade which, after hours of toil, would not dig out a sufficiency for one meal, of such roots as an English pig would turn away from in disgust. I have entered the cabins where working men were seated at their dinner, consisting of potatoes, a great proportion of which were about the bigness of marbles, the larger ones not much exceeding the size of a walnut. Happy the labourer who could obtain in addition a small quantity of thick milk: for to many of the poor it is an unwonted luxury. Before the time arrived for digging the miserable crop, Relief Funds, supported partly by a government grant, and partly by liberal subscriptions from the landlords, were established through the country. The committees appointed were enabled to sell yellow Indian meal at one shilling for fourteen pounds: and great was the delight with which the poor women, whose husbands and sons were working on the roads for eightpence a day, would walk a distance of six, eight, and sometimes ten miles, to purchase the meal and carry it home on their backs. About the end of August this seasonable supply was obliged to be stopped, and the poor were thrown on the resources afforded by their miserable gardens.

Then I have seen the labourer, his once stout limbs reduced by the presence of famine to the semblance of a skeleton's bones, standing in the furrows of an apparently empty field, languidly trying to strike his spade into the brown parched earth, and turn out the unripe blasted roots, which for many a long autumn day were to form his and his family's sole sustenance. His wretched ill clad wife, standing beside him with a kish to receive the black unwholesome food, looked first on the ground, and then, glancing upwards with such a look of patient death-stricken anguish as Englishmen seldom see, said, "Well! God Almighty look down upon us! What will become of us at all, at all!" The children, poor little things! once, even in the midst of rags and filth, so ruddy and happy, now wanting the accustomed mealy potato, which, evermore grasped in the tiny hand, and defended from the encroaching pig by many a sturdy cuff bestowed on his inquisitive snout, afforded healthy nourishment, are become pale, spiritless, and hollow cheeked; eagerly devouring blackberries and the fruit of the mountain ash, to stay the fierce cravings of hunger.

This is no exaggerated picture: it falls indeed far short of the truth. To our poor people the potato was all in all; it formed the sole food of the labouring classes, and the refuse skins and small potatoes served to fatten a pig, on the price of which his owners chiefly depended for their rent and clothing. But this year pigs and potatoes are alike gone, and the small modicum of meal which the labourer can procure for his wages of eightpence a day, scarcely serves to sustain life in a family of eight or ten persons. In one district of the south-west of Ireland, upwards of one hundred deaths are ascertained, on unquestioned authority, to have been caused by starvation, during the month of October and first fortnight of November. The famine is indeed "sore in the land;" and, to use the emphatic language of Scripture, "all faces gather blackness."

Instead of dwelling longer on an abstract view of the subject, let me relate a little narrative which may serve,

(1) 1846.

in some slight measure, to illustrate the sufferings of the poor; and I trust, on their behalf, to awaken the efficient sympathy of our kind English and Scotch fellow-subjects.

In a mountainous part of the south-west of Ireland lived Tade Mahoney, his wife, and six children. He was a labourer employed on the ground of a middle-man, who rented a farm on the estate of a rich absentee landlord. Tade was an honest, industrious, poor fellow, who, at the age of twenty, had married a blooming girl of sixteen, possessing the considerable fortune of a feather-bed, a dresser, two goats, and a lamb.

He had a brother who was usually described by the neighbours as "a wild young devil that wouldn't be sed nor led by the priest himself," and to whom even his best friends could not deny the possession of that "truant disposition" which better befits the Prince of Denmark's favourite on the stage, than the son of a poor Irish labourer in real life. Yet the lad, whose name was James, possessed a fund of native untaught energy that seemed to promise no common results; and when, at the age of nineteen, on the death of his father, he sold his share of the patrimonial goods and chattels and set sail for America, to seek his fortune, the old village schoolmaster shook his head and said, "Well, there goes the 'cutest lad and brightest scholar that ever thumbed a Voster in my siminary. If his heels don't car him off from the work that his hands know well how to do, and his head to plan, the never a fear but he'll be coming back to us a gentleman one of these days."

After some time a letter arrived from him, to say that he had got into excellent employment in New York, and hoped soon to send for his brother. But after this no more was heard of him, and his friends, after making many fruitless inquiries, came to the conclusion that he must be dead.

Meantime, Tade and his wife lived happily, though poorly, in their humble cabin. In the course of twelve years, six rosy brats might be seen about the door, wading through the pool of stagnant green water which, in imitation, no doubt, of the ancient moat, forms an exterior defence to our Irish cabins. Tade worked for his master, a "strong farmer," on the usual terms. Throughout the year he worked for him four days in each week, and received in return a cabin rent free, an acre and a half of potato ground, and grass for a few sheep and goats. He had also a pig; and his wife Jude reared hens, and sold the eggs and chickens at the next market town; so that on the whole they were tolerably comfortable, and more contented under their narrow straw roof, and seated round their supper of potatoes and goats' milk, than many a nobleman partaking of seasoned dainties in his gilded hall.

But this was not to last; the summer of 1846 came, and with it a blight on the food of the poor. Never was Egyptian plague more swift and noiseless, and deadly in its effects than the fearful "potato cholera." One by one their scanty articles of furniture, and then their goats and sheep were sold by the Mahoneys, to procure food for their starving children; and this resource would soon have failed, had not public works been established in the beginning of August. Until the funds of the relief committees were exhausted, most of the men in the country were employed on the roads at eightpence a day; poor wages, indeed, yet hailed by the perishing people as a blessed boon.

One wet day, towards the end of last August, Tade Mahoney returned to his cabin about six o'clock, faint and weary, after a day's work, which he thought himself only too fortunate to have obtained. He had tasted nothing since the previous evening, save a small piece of Indian meal cake, and a draught of water; and yet he did not feel hungry. His head was dizzy, his hands hot, and burning pains darted through his frame. He entered the cabin, and throwing his hat on the floor, sank heavily on a wooden stool placed near the small turf fire. His eldest daughter, a fair blue-eyed child of

ten years old, ran up to him, and, putting her little hand in his, said joyfully,

"Ah, daddy, we're to have a fine supper to-night, for mammy went to I—— for the male! And she brought home a bagful of it on her back; and see what a potful of it there's down for us all. She left Johnny and me to stir it, while she'd be out to look for a dhrop of milk."

The father tried to smile, as he replied in a tone of sorrow,

"I'm proud to hear it, Mary; 'tis long since ye had yer 'nough to ate, *ma colleen bawn*."

Just then Jude entered with an empty wooden can in her hand.

"Well, Tade," she said, "I thought to have a dhrop of milk for yer supper, so I went to Mrs. McCarthy to ax it; and I tould her I'd pay her in fresh eggs when the hens would lay to-morrow: but she said she had none for me, and so we must ate the biled male dry—thanks be to God for giving us that same. But, Tade, *a chree*, what ails you? You look very white, and there's a thrimblin' over you."

"'Tis only a sudden hate and pain in my heart I got, Jude; plaze God 'twill be nothing. I'll go to bed, and I'll be well waunst I'm asleep."

"And daddy, won't you ate any supper?" said little Mary and Johnny together, while his wife, laying one hand on his, and pressing his forehead with the other, looked anxiously in his face.

"I couldn't ate any thing, childher," he said, "if I was paid for it; and sure there'll be the more left for yees all tomorrow. Give me a dhrink of wather, Jude," and, rising with difficulty, he went towards a bundle of straw, which, scattered on the damp floor, formed, with an old rug, and the tattered remnant of a blanket, the only sleeping place for the whole family. The children felt frightened, they knew not why; yet the healthy appetite of their age prevailed, and they made a hearty supper on the Indian meal stirabout. Very little, however, did their poor mother swallow; her heart, as she expressed it, "rose to her mouth," when she thought that perhaps her husband was struck with "the sickness," as the poor people emphatically designate typhus fever, the plague that in wet and scarce seasons is wont to desolate the country. With a heavy heart she took a little straw, and placed it for the children as far as she could from the spot where their father lay, and then tried in vain to cover them with a few torn rags, in addition to their own miserable clothing. She lay down near her husband, whose burning skin, heavy breathing, and restless tossing to and fro, showed too plainly that her fears were well-founded. In the morning his illness had greatly increased; he called incessantly for water, and soon became quite delirious.

It was dispensary day in the next village of I——, and Jude, having settled her husband's miserable bed as comfortably as she could, and left the two elder children to watch him, and mind the younger ones, set out on her walk of six miles to procure medicine and advice. I—— lies in the centre of a populous district, and, the physician's attendance at the dispensary being limited to one day in the week, there is always a large crowd of country people assembled to watch for his coming; some really ill, and greatly requiring attention, others afflicted with none but imaginary maladies, yet demanding physic with the utmost eagerness; for the Irish peasant (when he can be supplied with them gratis), is quite as fond of swallowing drugs as any titled lady in London can be, when suffering from an attack of the nerves. Certainly, the parallel would scarcely hold good as to the nature of the symptoms, or the manner of describing them; and I fancy her Majesty's physician in ordinary would feel quite as much puzzled as I did at the conclusion of the following dialogue, which I write verbatim.

I one day met a man whose wife had been long

afflicted with an inward disease, about which she had consulted many physicians, as well as country quacks and *chamners*.

"Well, Jack," I said, "how is your wife to-day?"

"She's a dale better, Ma'am, thank your Honour. Dr. B. was up here yesterday hunting in the glen, and like a good gentleman as he is, God bless him, he came into our place to see Kitty, and he found out at wanst what ailed her."

"And what is it, Jack?"

"He says, Ma'am, there's something across her lungs that purvints the drink from straining through her, and whin he puts her through a *coorse* she'll be well in less than no time."

Now the fact was, the poor creature had an abscess on the liver, which, in spite of the medical skill employed, soon terminated her existence; but Jack felt perfectly sure that he had given a lucid explanation of her illness.

On the day in question, when Dr. — had disposed of about half his patients, kindly and skilfully prescribing for those who really needed his care, and dismissing somewhat summarily those whose maladies were of an infinitesimal a nature as the Homoeopathic doses, which, did their rank in life permit, the genius of quackery would certainly have doomed them to swallow, Jude Mahoney advanced and said: "Plase your honour, it's what I wanted to ax you about my poor man. He was taken very bad last night with pains through his bones, and a splitting in his head, and to-day he's worse, and out of his mind entirely."

Dr. — made some inquiries, and, finding from Jude's answers that her husband's disease was certainly typhus fever, he gave her the proper medicines, with directions how to use them, and promised to visit him as soon as he could. On her return she found the poor man in a paroxysm of delirium, and it was with much difficulty she could prevent his rushing out of doors. After a time she induced him to swallow the medicine, but no refreshing drink could she procure to allay his raging thirst—nothing but cold water. The next day a kind neighbour, almost as poor as themselves, brought a little milk, and another a handful of meal, "to make a bit of stirabout for the crathurs of childher;" but Tade grew worse and worse: and when, after some days, the doctor, whose professional engagements, extending over a wide district, had hitherto detained him, came to the cabin, he saw at once the case was hopeless.

Heart-rending were the lamentations of poor Jude, when, on the tenth day of his illness, she saw him, who was indeed the "delight of her eyes," stretched before her cold and lifeless as the clay on which he rested. Her neighbours flocked in, and, regardless of danger from infection, crowded the house for two days while the body was "waked." Part of that time the widow was seated on the ground, rocking herself to and fro, in the stupor of grief; and, when occasionally she was roused to a full consciousness of her loss, she would pour forth a torrent of that eloquent heart-felt lamentation, which is seldom heard out of Ireland—calling on her husband to return to her and to his "fair-haired jewels," and almost cheating herself into the belief that he could indeed hear and answer her entreaty.

It was the evening after poor Tade's funeral, and the widow sat down with her six little orphans in their lone and desolate cabin. Everything, even to the griddle on which she baked their meal-cakes, had been sold to defray the expense of burying her husband "decently;" for this the Irish think much more needful than procuring comforts for the living, and, to secure a handsome "berrin" for a dead relative, they will literally take the bread from the lips of the survivors. On this evening, therefore, when Jude Mahoney looked round the four bare walls of her cabin, she could see nothing in prospect but the starvation that awaited her and her helpless ones. She collected a few crusts which had been left from the entertainment of the "wake," and, after dividing them among the children, she knelt down, and in simple

uncouth language implored the protection of Him in whom the widow and orphan are invited to trust, and who hears the petitions that arise from a clay-built hovel, as well as the proud anthems of praise that swell through the cathedral's fretted aisles. They then lay down on the floor, where the children slept, and the mother watched till morning.

Soon after sunrise they prepared to set out on their mournful journey; for nothing was left for them but to travel, that is, to wander about the country, calling at every house they passed, and subsisting on the charity which is never withheld from the beggar, by those who are themselves but a few degrees better off. Jude had told the farmer for whom her husband had worked, that she would surrender her house and now worthless garden; and this day he was to take possession. With a bursting heart the poor woman set out, carrying her youngest child of a year old on her back, and leading the next little creature of three by the hand; the others walking on. She carried nothing with her save an empty bag, which Johnny bore across his shoulder, and in which they meant to deposit any donation of meal, bread, or black potatoes, which they might receive.

They had not gone far when they were met by two men, whom Jude recognised as distant cousins of her husband, and who were themselves poor labourers living in the county of Kerry, about thirty miles from the village of I—.

"God save you, Jude," said the elder of the two, "'twas only yesterday we heard of your trouble, or else we'd have come to poor Thady's 'berrin;' and thinking that, now your provider is gone from you, and the times so bitter, y'd have nothing to do but to take to the road with the *grawls*, we settled with our women that, if 'tis plasing to you, we'll ache take one of the young things from you, and give it the run of the cabin along with our own, till such time, plase God, as you'll be up in the world again."

The widow's eyes filled with tears; gratitude to the kind-hearted speaker mingled with reluctance to part from her little ones, yet she knew that in her situation it would be madness to hesitate; so she answered: "God for ever bless you, Denis and Jerry, for thinking of me and mine in our desolation; and sure, though it tears the sore heart within me to part with them that I bore and suckled at my breast, 'tis all for the best, and may be I'll be able sometime or other to travel into your parts, and get a sight of the crathurs that ye're taking now for the love of God."

"Then 'tis you that will be kindly welcome," said the man, rubbing the back of his hand across his eyes, "'tis little we have to give, because 'tis little we have for ourselves, but little or much, your *lanuveens*! shall share the bit and sup with our own. Which of them will come with us, Judy?" he continued, in a more cheerful tone. The mother hesitated, but at length it was decided that the youngest boy and girl should be taken, as being the least able to bear the hardships of a wandering life; and, with mingled tears and blessings, Jude gave them into the hands of their relatives, to whom feeling hearts had taught more true tenderness than dwells under many a smooth aspect and jewelled robe. She watched them on their homeward path, till a turning in the road hid them from her view, and then with the other children she resumed her weary journey.

It would be tedious and harrowing to the feelings to accompany this poor family through their wanderings for the next month. Sometimes they got a night's shelter and a piece of bread in the house of a farmer; often they had to sleep under an open shed, or behind a haystack; and their fasts were frequently prolonged for twenty-four hours. Yet Jude preferred undergoing these sore privations to seeking admission into the overcrowded pestilential precincts of the workhouse.

where she would be separated from her children. They travelled, as the poor little ones' failing strength would admit, over a distance of many miles. One evening at sunset they stopped at a cabin, a little removed from the high road, to ask for a night's lodging. They had travelled all day without food, save a few fragments of hard oatmeal cake, given them the night before by a farmer's wife: they were now therefore faint with hunger, and the poor children's blistered feet refused to carry them farther. The youngest boy, of six years old, a fair-haired child with regular features and soft intelligent eyes, showed symptoms all day of heavy sickness. He did not complain, but, whenever they sat down for a brief rest, his head was nestled in his mother's bosom, his little hot hand stole round her neck, and his white lips (once so rosy) asked plaintively for "water, mammy! more water!" She carried him in her arms, or on her back, as long as she could; for their path lay over a desolate mountain, where, for many a mile, no human habitation was to be seen; but for the last hour the little fellow insisted on trying to walk, saying,

"You're wake, mammy, and 'tis worse to me to be tiring you than to walk myself."

But now his emaciated limbs failed, and, when they were within a few steps of the cabin, he sank on the ground.

"God Almighty help my child, and look down on him," said the poor mother, raising him in her feeble arms; and, entering the cabin with the customary salutation, "God save all here," she asked a woman who was seated inside the door, to give a night's lodging to her "*lanuv brotha*."¹

"You shall have that same," replied the woman, "but 'tis little else I have to give. Look here"—and she took from the shelf a wooden can, containing about a pint of coarse flour. "My husband," she continued, "is working on the Caherah road since yesterday week without getting a penny wages: he went there to-day without breaking his fast, except with a drink of water and a small taste of cold cabbage; and now that's all I have to cook for him and five of us besides, for this night and the whole of to-morrow."

Famine, with his stern graving tools, had indeed carved deep lines in the haggard countenances of the two women; and the miserable children of the wanderer, when mingled with those of the dweller in the cabin, presented a lamentable picture of premature decay.

The husband soon came in, and the meal, if such it could be called, was prepared for him. He just tasted it, and then, calling his wife and children, insisted on their sharing the morsel; he even offered some to the poor travellers, and the three elder children ate a scrap each; but the widow thanked him and refused to touch it. Her heart was full, and her eyes were fixed on the heaving chest and clammy forehead of her dying child; for it was evident that the sorrows of the little wanderer were nearly ended. She watched him through the night while he lay insensible; towards morning he gave a few convulsive sobs, and then, with one long sigh, the gentle spirit was released.

I will not try to paint the mother's anguish; nor what she felt when, on that day week, another child was taken from her—her dark-eyed smiling little Ellen. In the midst of her sorrow she knew they were at peace.

"And oh! darlings of my heart," she said, "'tis hard to part ye, but 'twas harder still to feel the parched lip and not have a drop of milk to wet it, and to see the very life draining away for want of the bread that I'd give my heart's blood to buy for ye. But now 'tis all over, and only for them that are left me still, I'd be glad to lie down beside ye."

At length the widow's wanderings brought her back to her former abode. The cabin had not been since inhabited, and beneath its desolate roof she and her

two remaining children prepared one night to take up their lodging. They had a few turnips and a bit of barley bread to eat, and they had collected a bundle of fern and heath to sleep upon. They were all ill and feeble, but Jude had, as she expressed it, "a weight of sickness on her heart," that she felt would soon terminate her earthly sorrows.

Johnny closed the door, they lay down on the ground, and were trying to sleep, when a loud knocking outside aroused them.

"Who's there?" asked Jude, starting up.

"Is it here," said a voice, "that Tade Mahoney lives!"

"God help me, 'tis here he did live, but he's gone to his rest these six weeks."

An exclamation of surprise and sorrow was the answer, followed by a request for admission. Jude hesitated, but at length opened the door. There was no light in the cabin, save that afforded by a few turf embers, but she lighted a splinter of bogwood which happened to have remained on the ground, and the uncertain flame shone on the person of her visitor. He was a tall good-looking man, well dressed, more in the fashion of a town than in that of the country; and there was an expression in his countenance of amazement, almost horror, as he looked on the cabin and its inhabitants.

"Can you," said he, "tell me any thing of Tade Mahoney's family?"

"I'm his wife," replied the poor woman, "and these are his children. I buried two more of them since the light of my eyes was taken from me, and there are two living with his cousins."

The man seemed deeply moved; he trembled as he asked in a faltering voice—

"Don't you know me, Judy? I'm James, your husband's brother, and little I thought to find you this way on my return. My poor Thady! many's the time I longed for a warm shake of your hand, and a welcome home from your pleasant voice."

He could say no more, but, turning towards Mary and Johnny, he clasped them both in his arms.

After some time he continued:—

"Now, Judy, you must not be this way any more; I'm well to do in the world, for when I left New York, I got a fine farm far up the country. There I married an English girl, whose family are settled near me, and a good wife she makes. I often wrote to Thady, but never got an answer."

"We never heard from you," said Judy, "and so we thought you were dead."

"Letters often miscarry in those remote places," answered James, "and I suppose it happened that way. At all events, I came over now, intending to take you all out with me; and rely on it, Judy, I'll do as much for you and the children as if my poor brother was alive."

The widow burst into tears—"God for ever bless you, James," she said, "and sure 'twas He sent you here to us, when I didn't know where to get another bit to keep life in my perishing orphans. For myself it doesn't matter: the hand of death is on me, and soon I'll be where hunger and thirst and nakedness won't part me from them that were more to me than life itself. My blessing be ever on you and about you, and keep you and yours from harm and loss. I know you'll be a father to them two darlings, and to the other two weeny ones that I'll never see more in this world."

James could no longer restrain his emotions; he sobbed like a child, and, pressing the wasted hand of his sister-in-law, he could only say—

"May God protect and bless them, Judy—I'll do for them as if they were my own. My wife has a tender heart, and I'll answer for her she'll be a mother to them."

In a fortnight after the scene I have described, the widow breathed her last in a comfortable lodging in

(1) Sick child.

Cork, whither her brother-in-law had removed her. In the mean time he went into Kerry, and rewarded the kind-hearted Denis and Jerry for the care of the little orphans, who were brought to receive their mother's last blessing. In accordance with her wish, he arranged to pay their protectors liberally for their board and lodging, until they should be old enough to cross the Atlantic. After a little time he succeeded in calming the wild grief of Mary and Johnny, and reconciling them to going with him. He now only waits the approach of spring, to engage a passage for himself and them in a packet bound for America.

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SCENES.

By F. E. S.

CHAP. VIII.

TURNING THE TABLES.

ABOUT a week had elapsed after the events which I have just recorded, when one morning, shortly before my return to Cambridge, I received a letter from Coleman, detailing the finale of the bell-ringing affair—it ran as follows.

MY DEAR FRANK.—Doubtless you are, or ought to be, very anxious to hear how I contrived to get out of the scrape into which you and the Honourable George managed to inveigle me, having previously availed yourselves of my innocence, and succeeded, through the seductive medium of oysters and porter, in corrupting my morals, and then leaving me, poor victim! to bear the blame and suffer the consequences of our common misdemeanour. However, mine is no pitiful spirit to be quelled by misfortunes, and, as dangers thickened around me, I bore up against them bravely, like—like—(was it Julius Caesar or Coriolanus who did that sort of thing! but never mind)—like a Roman brick, we'll say; the particular brick is quite immaterial, but I must beg you to believe the likeness was something striking. To descend to particulars.—Hostilities were commenced by that old ass Mayor Dullmug, who took out a summons against me for creating a riot and disturbance in the town, and, the first day the Bench sat, I was marched off by two policemen, and locked up in a little dirty room, to keep cool till their worships were ready to discuss me. Well, there I sat, kicking my heels, and chuckling over a heart-rending little scene I had just gone through with my mother, whose dread of the terrors of the law was greatly increased by the very vague ideas she possessed of the extent of its powers. The punishment she had settled in her own mind as likely to be awarded me was transportation, and her farewell address was as follows.—“If they should be cruel enough to order you to be transported for fourteen years, Freddy my dear, I shall try to persuade your father (though he's just like a savage North American Indian about you) to get it changed 'for life' instead, for they always die of the yellow fever for the sharks to eat them, when they've been over there three or four years, and four years are better than fourteen, though bad's the best, and I'm a miserable woman.—I read all about it last week in one of Captain Marryatt's books, and very shocking I thought it.”—Having ventured to hint that, if I was carried off by the yellow fever at the end of a year or two, the length of my sentence would not signify much to me when I was dead, I was rebuked with, “Don't talk in that shocking way, Frederic, as if you were a heathen, in your situation, and I hearing you your Collect every Sunday, besides Mrs. Hannah Moore, who might have been a saint if ever there was one, or any thing else she liked with her talents, only

she was too good for this wicked world, and so she went to a better, and wrote that charming book ‘Celebs in search of a Wife.’” Oh! my poor dear mother's queer sentences! I was becoming shockingly tired of my own company, when it occurred to me that the correct thing was to carve my name on the Newgate stone, à la Jack Shepherd, and I was just putting a few finishing strokes to the N of Coleman, wherewith, in characters at least six inches long, I had embellished a very conspicuous spot over the chimney-piece, when I was surprised “with my chisel so fine, tra la,” (i.e. with a red hot poker which I had been obliged to put up with instead, it being the only implement forthcoming,) by the officials who came to summon me, and who did not appear in the slightest degree capable of appreciating the beauties of my performance. By them I was straightway conducted into the awful presence of sundry elderly gentlemen, rejoicing in heads all more or less bald, and faces expressing various degrees of solemn stupidity, who in their proper persons constituted “the Bench.” Before these grave and reverend Signiors did Master Dullmug and his satellites

“Then and there
Rehearse and declare”

all my heinous crimes, offences, and misdemeanours; whereupon the aforesaid Signiors did solemnly shake their bald heads, and appear exceedingly shocked and particularly puzzled. Well, at last I was called upon for my defence, and, having made up my mind for some time what line I would take, I cut the matter very short by owning to having assisted in ringing the bells, which I confessed was an act of folly, but nothing more, and that the idea of its constituting an offence punishable by law was absurd in the extreme. This sent them to book, and, after turning over sundry ponderous tomes, and consulting various statutes of all sorts and sizes, besides whispering together, and shaking their heads once and again, till I began to fear that their necks must be in jeopardy, they arrived at the conclusion that I was right, or thereabouts. This fact, the eldest, most bald, and most stupid of the party, chosen by common consent, doubtless in virtue of these attributes, as spokesman, proceeded to communicate to me, in a very prozy harangue, to which he appended a lecture (a sort of stock article, which he evidently kept constantly on hand, with blanks which could be filled up to suit any class of offender), in which he pointed out the dangers of juvenile indiscretions, and the evils of dissipation, winding up with the assurance that, as I seemed deeply sensible of the error of my ways, they, the magistrates, would, on my making a suitable apology to that excellent public functionary the Mayor of Hillingford, graciously deign to overlook my misconduct. During his long-winded address, a new idea struck me, and, when he had concluded, I inquired with all due respect whether “I was to understand that it was quite certain I had committed no offence punishable by law?” To this he replied, “that I might set my mind completely at ease upon that point; that, though morally speaking I had been guilty of a very serious misdemeanour, in the eye of the law I was perfectly innocent.” “In that case, gentlemen,” replied I, “the liberty of the subject has been infringed; I have been kept in illegal confinement for some hours, and I believe I have my remedy in an action for false imprisonment against Mr. Dullmug, does not the law bear me out in what I state?” Again they had recourse to their books, and were unwillingly forced to confess that I was right in my law. “Then,” continued I, “so far from making any apology to Mr. Dullmug, unless that gentleman consents to beg my pardon, and give me a written apology for the unjust and illegal persecution to which he has subjected me, I shall at once take the necessary steps to proceed against him immediately.”—Oh! Frank, what would I have given for you to have been there, when I announced this deter-

mination! there was such a shindy as I never before witnessed: old Dullmug was furious, and said he'd never apologize: I declared, if he didn't, nothing should prevent me from bringing my action; the magistrates tried to persuade me, but I was inflexible; and (by Jove! I was very near forgetting the best part of it all) my governor, who was in Court, the moment he found the law was on my side, turned suddenly round, vowed I had been shamefully used, and that, if it cost him every farthing he possessed in the world, he would see justice done me. So the end of it was, that old Dullmug was forced to write the apology; it now lies in my writing desk, and I look upon it as one of the proudest trophies man ever possessed. So, Master Frank, considering all things, I think I may reckon I got pretty well out of that scrape. Ever your affectionate, F.C.

P.S.—What have you said or done to render old Vernon so bitter against you? Clara Saville tells Lucy, that, when she informed him of her having met and conversed with you alone in the Park that day, he flew into such a rage as she had never seen him in before, and abused you like a pickpocket, and she says she feels certain that, from some cause or other, he entertains a strong personal dislike to you. *Entre nous*, I don't think the fair Clara seems exactly to sympathize with him in this feeling. Considering that you had somewhat less than half an hour to make play in, from Lucy's account you do not seem to have wasted much time. Ah! Master Frank, you are a naughty boy; I can't help sighing when I reflect, how anxious your poor dear mother must feel about you, when she knows you're out.

"Still the same light-hearted merry fellow as ever," exclaimed I, as I closed the letter, "how long, I wonder, will those buoyant spirits of his resist the depressing effect which contact with the harsh realities of life appears always sooner or later to produce? Strange, what he says about that Mr. Vernon; I am not conscious that I ever met the man till the evening of the ball, and yet I fancied there was something which seemed not utterly unfamiliar to me in the expression of his face. Vernon! Vernon! I don't believe I ever heard the name before—it's very odd. Of course what he says about Miss Saville is all nonsense; and yet there was something in her manner, which made me fancy, if I had time and opportunity—psha! what absurdity, I shall have enough to do if I am to imagine myself in love with every nice girl who says 'Thank you' prettily for any trifling service I may chance to render her—I am sure she is not happy, poor thing! seriously, I wish I were sufficiently intimate with her to be able to afford her the advice and assistance of a friend, should such be ever required by her. I should take the liberty of asking old Vernon what he meant by his extraordinary behaviour towards me, were I to see much more of him; there's nothing like a little plain speaking. But I need not trouble my brains about the matter; I shall probably never meet either of them again, so what does it signify?—she certainly is the loveliest girl I ever saw though! heigho!" and, with a sigh for which I should have been somewhat puzzled rationally to account, I took up my gun, and set off for a day's shooting with Harry Oaklands.

Time, that venerable and much vituperated individual, who, if he has to answer for some acts savouring of a taste for wanton destruction,—if he now and then lunches on some noble old Abbey, which had remained a memorial of the deep piety and marvellous skill of our forefathers,—if he crops by way of salad some wide spreading beech or hoary patriarchal oak, which had flung its shade over the tombs of countless generations, (and, as it stood forming a link between the present and the past, won men's reverence by force of contrast with their own ephemeral existence), yet atones for his delinquencies by softening the bitterness of grief, blunting the sharp edge of pain, and affording to the broken-hearted the rest, and to

the slave the freedom, of the grave;—old Time, I say, who should be praised at all events for his perseverance and steadiness, swept onward with his scythe, and cutting his way through the frost and snow of winter, once more beheld the dust of that "brother of the east wind," March, converted into mud by the showers of April, and the summer was again approaching. It was on a fine morning in May, that, as Oaklands and I were breakfasting together in my rooms at Trinity, we heard a tap at the door, and the redoubtable Shrimp made his appearance. This interesting youth had, under Lawless's able tuition, arrived at such a pitch of knowingness, that it was utterly impossible to make him credit anything; he had not the smallest particle of confidence remaining in the integrity of man, woman, or child; and, like many another of the would-be wise in their generation, the only flaw in his scepticism was the bigoted nature of his faith in the false and hateful doctrine of the universal depravity of the human race. He was the bearer of a message from his master, inviting Oaklands and myself to a wine party at his rooms that evening.

"I suppose we may as well go," said Oaklands; "I like a positive engagement somewhere,—it saves one the trouble of thinking what one shall do with oneself."

"You can accept it," replied I, "but it would be a waste of time which I have no right to allow myself; not only does it make one idle while it lasts, but the next day also, for I defy a man to read to any purpose the morning after one of Lawless's symposia."

"My dear boy," returned Oaklands, stretching himself, "why do you take the trouble to use a long word, when a short one would do just as well? If I could but get you to economize your labour, and take things a little more easily, it would be the greatest advantage to you; that everlasting reading too,—I tell you what, Frank, you are reading a great deal too hard; you look quite pale and ill. I promised Mrs. Fairleigh I would not let you overwork yourself, and you shall not either—come, you must and shall go to this party, you want relaxation and amusement, and those fellows will contrive to rouse you up a bit, and do you good."

"To say the truth," I replied, "that is one of my chief objections to going. Lawless I like, for the sake of old recollections, and because he is at bottom a well-disposed good-hearted fellow, but I cannot approve of the set of men one meets there,—it is not merely their being what is termed "fast" that I object to, for, though I do not set up for a sporting character myself, I am rather amused than otherwise to mix occasionally with that style of men; but there is a tone of recklessness in the conversation of the set we meet there, a want of reverence for every thing, human and divine, which I confess disgusts me,—they seem to consider no subject too high or too low to make a jest of."

"I understand the kind of thing you refer to," answered Oaklands, "but I think it's only one or two of them who offend in that way; there's one man who is my particular aversion; I declare, if I thought he'd be there to-night, I would not go."

"I think I know who you mean," replied I; "Stephen Wilford, is it not? the man they call 'butcher,' from some brutal thing he once did to a horse."

"You're right, Frank; I can scarcely sit quietly by, and hear that man talk. I suppose he sees that I dislike him, for there is something in his manner to me which is almost offensive; really sometimes I fancy he wishes to pick a quarrel with me."

"Not unlikely," said I, "he has the reputation of being a dead shot with the pistol, and on the strength of it he presumes to bully every one."

"He had better not go too far with me," returned Oaklands, with flashing eyes, "men are not to be frightened like children; such a character as that is a public nuisance."

"He will not be there to-night, I am glad to say," replied I, "for I met him yesterday, when I was walking with Lawless, and he said he was engaged to Westworth

this evening; but, my dear Harry, for heaven's sake avoid any quarrel with this man; should you not do so, you will only be hazarding your life unnecessarily, and it can lead to no good result."

"My dear fellow, do I ever quarrel with any body? there is nothing worth the trouble of quarrelling about in this world; besides, it would be an immense fatigue to be shot," observed Harry, smiling.

"I have no great faith in your pacific sensations, for they are nothing more," rejoined I; "your indolence always fails you, where it might be of use in subduing (forgive me for using the term) your fiery temper; besides, in allowing a man of this kind to quarrel with you, you give him just the opportunity he wants; in fact you are completely playing his game."

"Well, I can't see that exactly; suppose the worst comes to the worst, and you have to fight him, he stands nearly as good a chance of being killed as you do."

"Excuse me, he does nothing of the kind; going out with a professed duellist is like playing cards with a skilful gambler; the chances are very greatly in his favour; in the first place, nine men out of ten would lose their nerve entirely, when stationed opposite the pistol of a dead shot; then again there are a thousand apparent trifles, of which the initiated are aware, and which make the greatest difference, such as securing a proper position with regard to the sun, taking care that your figure is not in a direct line with any upright object, a tree or post for instance, and lots of other things of a like nature which we know nothing about, all of which he is certain to contrive to have arranged favourably for himself, and disadvantageously for his opponent. Then, having as it were trained himself for the occasion, he is perfectly cool and collected, and ready to avail himself of every circumstance he might turn to his advantage—a moment's hesitation in pulling the trigger, when the signal is given, and he fires first—many a man has received his death wound before now, ere he has discharged his own pistol."

"My dear boy," said Harry, "you really are exciting and alarming yourself very unnecessarily; I am not going to quarrel with Wilford, or any body else; I detest active exertion of every kind, and consider duelling as a fashionable compound of iniquity, containing equal parts of murder and suicide—and we'll go to Lawless's this evening, that I'm determined upon—and—let me see—I've got James's new book in my pocket. I shall not disturb you if I stay here, shall I? I'm not going to talk."

Then, without waiting for an answer, he stretched himself at full length on (and beyond) the sofa, and was soon buried in the pages of that best of followers in the footsteps of the mighty genius of the North, Walter Scott—leaving me to the somewhat less agreeable task of reading *Mathematics*.

ON THE TEMPERATURE OF THE BEE-HIVE IN WINTER.

WHEN those interesting and laborious little creatures, the bees, have completed their labours for the year, and having harvested the last drop of honey from the flowers of autumn, retire to their hives to sleep away the winter, we feel curious to know how they bear the severities of the season, and what means, if any, are employed to keep out the cold.

Upon this subject naturalists have differed greatly in opinion. Réaumur states, that, during the season when the country furnishes no food for bees, they do not require to eat: the cold, which deprives our fields and gardens of their flowers, renders the bees torpid, in which state no transpiration takes place. Swammerdam, Huber, and others state, on the contrary, that

bees do not become torpid in winter, but that even in frosty weather a full hive can maintain a temperature of 86 or 88 degrees Fahrenheit.

This interesting question remained in this condition until a few years ago, when Mr. Newport (who has enriched the science of Entomology with some splendid discoveries) instituted an extensive and profound inquiry into the subject of the temperature of insects. He had long suspected of incorrectness the opinion that the hive is able to maintain a high temperature in winter, a circumstance so much at variance with the habits of insects in this country that, were it so, the hive bee would form a singular exception to the general economy of British insects. The only method, as it seemed to Mr. Newport, of arriving at the truth, was to make such arrangements as would enable him at any time, during many months, to ascertain at a glance the internal temperature of the hive. He placed a common straw hive with its entrance hole in the direction of another wooden hive, which was standing beside it in a bee-house so constructed that the whole of the back part of the house could be removed or closed at pleasure. The proper entrance for the bees at the front of the bee-house was directly into the wooden hive, from the side of which there was a little covered communication with the entrance hole of the straw hive, to serve as a passage for the bees, and a connexion between the wooden and straw hive. The object of this was to prevent any sudden effect upon the temperature of the hive by changes which might occur in the temperature of the air without. The interior of the straw hive was thus subjected as little as possible to the variations in the open atmosphere, since the bees were obliged to pass through the empty wooden hive before they could reach the open air. In order to make the experiment with the greatest accuracy, it was necessary that the bees should never be disturbed while making an observation, and therefore a small thermometer, with a long free bulb, was passed through a hole just large enough to admit it in the top of the straw hive, about eight inches from the centre, and retained there during the whole of the subsequent observations without being removed or touched. The bees at first seemed a little inconvenienced by its presence, but within two or three days they became accustomed to it, and removed the comb and wax from around it, so that the bulb of the instrument was remaining about an inch within the free space of the hive, and the observations were then made at intervals with the greatest accuracy. The temperature of the atmosphere was taken with a thermometer similar to the one used for the hive. It was thus only necessary to notice, from time to time, the rise and fall of each thermometer, and the difference between them, the temperature of the air being of course taken in the immediate vicinity of the bee-house.

By this course of observation it was found that the hive bee during winter does not become absolutely torpid; but, if left entirely undisturbed, it passes into a condition in which its temperature of body and amount of respiration become very greatly diminished,—a state of deep sleep in the combs, from which, by a beautiful provision of nature, it is roused by great cold. As soon as the temperature falls considerably, the insect shakes off its torpor and commences breathing with energy, by which an amount of animal heat is produced which exerts its salutary influence on the air of the hive. It is only at a moderate temperature that the insects continue torpid, and, when in this state, it is very easy to rouse them from it by gently shaking or tapping the hive. When this is done in winter the bees wake up, become excited, and soon by the rapidity of their respirations raise the temperature of the hive to a great height. In the case of Huber and others who did not observe the scientific precautions of Mr. Newport, the thermometer was introduced into the hive at the time of making the observation, thereby disturbing the

bees, and exciting them to increased vital energy, and consequently to increased animal heat. The effect of a sudden disturbance of bees is strikingly shown in the following observation. On the morning of the 2d of January, 1836, at a quarter past seven, A.M.; when there was a clear intense frost, and the thermometer in the open air stood a little above 17 degrees, that in the hive marked a temperature of 30 degrees; that is, actually two degrees *below* the freezing point. The bees were roused by tapping on the hive, and in sixteen minutes the mercury rose to 70 degrees, or 53 degrees above the external air.

It was found by a long course of observation that the temperature of the hive, when the bees are in a state of repose, varies with that of the atmosphere; but that the change within the hive is never so rapid as in the atmosphere, unless the bees have been disturbed. When the external temperature rises very suddenly, it never exceeds that of the hive by more than one or two degrees, provided the bees are in a state of absolute rest: but if, on the contrary, the temperature of the atmosphere be suddenly diminished, that of the hive will subside also, but much less rapidly. Sometimes the two thermometers stand exactly equal to each other. On the other hand, when the bees are active and respiring quickly, the hive is even then affected in the winter months by great changes in the temperature of the external air, particularly if such changes occur late in the autumn, or at the beginning of winter.

But a change in the atmosphere in summer does not so readily affect the temperature of the hive, because in summer, when the general warmth of the atmosphere ranges from 45 degrees and upwards, the bees are always active, and are not themselves so readily affected by sudden changes; while in winter, when the temperature ranges from 45 degrees downwards, the bees are very soon affected by diminished heat, and become disposed to pass into the torpid state, in which scarcely any respiration takes place, and the temperature of the little animals sinks down, or nearly so, to that of the medium in which they are placed, and even to that of the external atmosphere, if there is communication with it. Each bee is probably, in general, from 10 to 15 degrees warmer than the medium in which it lives when in a state of moderate excitement, but its heat is liable to be greatly increased from causes which will be noticed in another article, on the temperature of the hive in summer.

It has been already shown, that a surprising amount of heat may be suddenly developed in the hive even in mid-winter, by exciting the bees. In a second straw-hive, which Mr. Newport had exposed to the open air like the common cottage-hives, the internal temperature at 10 o'clock, A.M. of the 2d February, was a little over 48 degrees, being only 14 degrees higher than that of the external atmosphere. On disturbing the hive by tapping, the mercury rose to 102 degrees, or 68 degrees above the temperature of the surrounding air. When the heat is thus suddenly increased during the earlier or latter part of winter, it becomes intolerable to the bees, and they immediately endeavour to reduce it by ventilation, provided the outer cold be not too severe to prevent their assembling near the entrance of the hive. At about 40 degrees, the temperature of the hive is quickly modified by the assiduity of the bees; "I have often," says Mr. Newport, "been amused by observing them after the hive has been disturbed for a short time, although but a few minutes before there was not a single bee on the alighting board, come hastily to the entrance of the hive, and having arranged themselves within three quarters of an inch of the doorway, begin to fan with their wings most laboriously, to occasion a current of cool air through the interior of the hive." On one occasion, when the temperature of the hive had been raised to about 70 degrees, the external

air being at 40 degrees, the bees at mid-day maintained the temperature steadily at 57 degrees by their mode of ventilation, the hive continuing all the time to be excited.

Although the hive be very much disturbed, and its temperature become greatly increased by exciting the bees in mid-winter, it will soon become quiet again, and its temperature be again reduced to within 10 or 12 degrees of the temperature of the atmosphere within about ten hours.

HISTORY OF THE COTTON MANUFACTURE.¹

THE mule had not more than thirty spindles at first, but this number was rapidly increased, and double-frames and spindles introduced, so that Manchester can now show some machines with more than two thousand spindles. What a contrast between such engines, each forming two thousand threads of cotton at the same time, and the simple spinning-wheel, with its one spindle, which was upset in the cottage of Hargreaves. Startling, too, is the difference between the tall seven-storied factory, re-echoing with the busy life and ceaseless din of multitudes, and the lone cottage of the spinner, placed on the verge of some Lancashire moor, or in the tranquil depths of a Derbyshire fell.

This invention of Crompton gave a mighty impulse to the cotton trade, and enabled the English manufacturers to produce the fine muslins which now vie with the once famed products of the East. The inventor of the mule took out no patent, and sought no exclusive privileges; thus presenting a remarkable contrast to others, whose fierce rivalry attracted the attention of the whole kingdom. He therefore amassed no fortune, and was even compelled to subsist in his old age upon a small yearly pension of sixty-three pounds, raised by the subscriptions of those who saw the brilliant results which had followed the labours of Crompton. Not that the nation was wholly unmindful of its benefactor, as parliament voted the sum of 5,000*l.* in 1812, to the inventor of the mule-jenny. This grant was not productive of much happiness to Crompton, who, attempting to establish his sons as cotton manufacturers, saw the 5,000*l.* rapidly sunk in the vortex of unsuccessful trade.

He lived to the year 1827, witnessing the accumulating fortunes made by means of his invention, and gazing from his lowly condition on the honours surrounding an Arkwright, or a Peel; whilst to him the sixty-three pounds alone appeared as the small reward of a great discovery.

The mechanical improvements of Crompton did not terminate invention in this department, others having still further developed the powers of the mule.

Mr. William Strutt, of Derby, introduced the *self-acting mules*, which may be almost said to execute their varied tasks without the aid of man, requiring but his word of command when to begin, and how long to work. The multiplicity of their operations, the skilful devices necessary for accomplishing rightly some of the simplest results, and the marvellous order apparent amidst such complexity, are fitted to astonish even the scientific mechanists; and few besides can fully comprehend the beauty of such machines. The lady who unrolls a yard of sewing-cotton from the reel, may not observe the regularity with which the thread is wound upon the bobbin, so that one turn is laid *by the side* of another all along the whole length, one never falling *upon*, but next the other. Was not this a simple operation? Far from it; some of the nicest arrangements were essential to secure such a regulated *side-movement*. The

(1) The curious subject of the ventilation of the hives by the bees, will be fully noticed in the article on the temperature of the hive in summer.

finest mechanical appliances, fruits of many a studious hour, produced that even reel of cotton which the lady has in her work-box. Let this one example suffice to suggest some notion of the numerous and diversified movements in the self-acting mules, which, as improved by Mr. Roberts of Manchester, present the singular spectacle of thousands of spindles whirling in a vast hall, where human hands have nought to perform. The last-named gentleman took out a patent for his design in 1825; and others are still bent upon advancing, to a higher perfection, the works left to England by Wyatt, Hargreaves, Arkwright, and Crompton.

Here our observations on the cotton manufacture might terminate, were *spinning*, and its connected operations, alone regarded. But it seems necessary to note a few important facts in the history of those machines by which the cotton thread is *woven* for our use. To enter into any general description of looms is foreign to our present purpose, a few observations on the *power-loom*, and weaving by steam, being all which is now contemplated.

When the spinning-jennys and mules came into full operation, many became apprehensive of the results, and feared lest England should be merely providing foreign nations with superior yarns, from which those rivals might form materials of a quality superior to our home productions. It was clear that the hand-loom could not use up *all* the twist which the machines of Arkwright and Crompton were able to produce; and, therefore, the surplus must go to the foreign manufacturer.

Some now began to speculate on the possibility of moving a number of looms by machine power, and thus creating a means of manufacturing in England the enormous amount of material produced in the spinning factories. Several ingenious persons had experimented on the possibility of producing such a mechanism for weaving, before the time of Dr. Edmund Cartwright, who was the inventor of the power-loom, but their plans led to few beneficial results.

Thus, in the reign of Charles II., M. de Yennes invented a loom moved by water-power; but it was regarded rather as a scientific curiosity for the speculation of the studious, than as the element of a vast national power; and was, therefore, neglected. The Royal Society, before which the paper describing the principles was read in 1678, might discuss and argue respecting the details of the new engine "to make linen cloth without the aid of an artificer, by M. de Yennes," but the age was not yet fitted to receive the offered gifts. Still the idea of a power-loom did not disappear from the minds of men; and, in the year 1750, M. Vaucanson contrived one to move by the action of swivels. The age had now become more sensible of the advantages to be derived from machinery; the device of Vaucanson attracted attention; and a factory for such looms was erected in Manchester by a Mr. Gartside. But of what use was a power-loom, whilst the old-fashioned spinning-wheel refused to furnish more than its very limited quantity of twist, for which even the hand-weaver had frequently to wait? and the power-loom had, therefore, little prospect of more than half work. It was folly, then, to call up a giant to perform the work which ordinary mortals could accomplish by the ancient methods. Besides, these swivel-looms were not attended with any material diminution of human toil, one man being required for the management of each; a fact by no means likely to satisfy those who had fixed their hearts upon machine power as the creator of new wealth and prosperity.

Many were disposed to question the possibility of constructing power-looms; and such was the prevailing opinion in the year 1787, when the busy engines of Arkwright were producing cotton twist by miles, in place of yards. In that year Dr. Cartwright and some gentlemen were eagerly discussing the results likely to follow from the recent introduction of the jenny, water-

frame, and mule, during which conversation some one casually remarked, that hands would never be found to weave the cotton produced by Arkwright's mill only; to which Cartwright, smiling, replied, that the great spinner must contrive a *weaving-mill* to use up his productions. All declared that such an invention was *impossible*; and several persons, well acquainted with the weaving process, entered into minute explanations to convince the Doctor of the utter hopelessness of the attempt. He understood little of weaving, and was unable to answer the technical arguments brought forward, but remarked that he did not consider a power-loom of more difficult construction than the automaton chess-player, which had been lately exhibited in London. He enlarged upon the difficulties which must have been overcome before a number of wires, wheels, and bits of wood could be so arranged as to play through the most complicated games; and, therefore, concluded that the power-loom was not an *impossible* machine.

After the party separated, Cartwright could not forget the nature of his own arguments; thoughts of their truth or falsehood were continually present; and he resolved himself to test the difficulties said to be so insuperable. He saw that in all weaving *three* different movements were repeated, over and over, till the work was complete. The warp was opened, the shuttle thrown, and the batten, descending, struck home the weft. Surely, thought he, it cannot be *impossible* to produce three different motions, nor to repeat them as often as necessary. With these reflections he commenced his experiments, and at last finished a machine which seemed likely to effect the intended object. As he understood nothing of weaving, a man well skilled in the whole process was engaged to set the machine to work. Operations began, and, to the delight of Cartwright, proceeded so satisfactorily, that a piece of stout sail-cloth was produced, as the first fruits of the device. But, however pleasing the result might be to Cartwright, he could not fail to note how little the man engaged to superintend the loom seemed to think of its power.

Nor was this surprising, every part being constructed upon a mistaken notion of the *force* requisite in weaving, which he had so over estimated, that all the springs and movements worked with a power far exceeding that which was requisite in an operation demanding more of lightness and regularity of action than power. His newly-produced loom was sadly deficient in these qualities, working with such violence, that two strong men were soon exhausted in the effort to direct its action. This would never do, as a little practical knowledge might have convinced Cartwright. He was, however, so delighted with his success, that a patent was taken out in April, 1785, for working the invention. Prudence now obtained a hearing, and strongly urged upon the exulting patentee the duty of acquiring some further knowledge of weaving before he committed himself to the manufacture of machines which might be utterly useless to practical men. Cartwright, therefore, began to study the mysteries of warp, weft, and shuttle; and quickly discovered that his invention was, in its present state, little better than a toy. He saw at the same time the source of its defects, and commenced a re-arrangement of the different parts, and an alteration of their form and size. In two years a new patent was taken out; and the inventor, who had now demonstrated the possibility of the power-loom, prepared to seek some solid advantages from his discovery. A weaving-mill was erected at Doncaster; but the perseverance of the discoverer was not united, in Cartwright, with the knowledge and habits of the trader; the undertaking, did not, therefore, lead to fortune, or even moderate advantages. The truth is, that the new invention required further development and modification, before it could supply the manufacturer with the desired power; and Cartwright was but another instance of a discoverer bringing his schemes into operation before

they had received that finish so essential to the profitable working of machinery. Still he was the first to demonstrate the facilities with which the power-loom could be worked, and to create an unceasing auxiliary of the spinning engines. No fear was henceforth expressed of a too abundant manufacture of yarn, for close at hand stood the loom to receive all that the engine could produce. So sensible was the nation of the great services performed by Cartwright, that Parliament voted him, in 1809, the sum of £10,000, as some compensation for his labours and efforts to develop the idea of the power-loom.

Cartwright, as some of our readers are doubtless aware, was distinguished in many respects for his mechanical genius, which was by no means limited to experiments on the loom; but extended to the production of locomotive carriages, and the propulsion of vessels by steam. In these absorbing and useful pursuits, Edmund Cartwright passed his life, far from the exciting and tumultuous scenes in which his brother, Major John Cartwright, was ever engaged. Both were distinguished for a mechanical genius; nor could the political struggles of the major wholly restrain him from such pursuits. The inventor of the power-loom died in 1824, at the advanced age of eighty-one, leaving to his country a power which has, next to the jenny and the mule, advanced the manufacturing strength of England.

Since the time of Cartwright, the power-loom has advanced with a rapidity which few could have predicted; for, whilst in 1820—four years before the inventor's death—the number at work was about 14,000, in thirteen years after no less than 100,000 of these machines made the land, as it were, to echo with their ceaseless din. Nor is the increase of number the chief point calling for attention, the command obtained over the engines, and the ease with which they are worked, being even more remarkable.

From this perfection of machinery arises that cheapness of cotton productions, which enables the Lancashire manufacturer to sell his goods in the distant provinces of India at a less rate than the native can produce them himself, though having the cotton on the spot, and few expenses by which the cost of his work can be increased. The mule and the power-loom, uniting their energies to the might of steam, have accomplished such results, and now startle the distant Hindoo weaver on the banks of the Ganges, by bringing to his hut a material to supersede the product of his own rude loom.

A good hand-loom weaver seldom produced more than forty-eight yards of cotton in a week, but a steam-loom weaver is able, with the assistance of a boy, to manufacture nearly four hundred and fifty yards; and this increased quantity shall also, in many cases, be of a quality superior to hand made goods. This result may surprise those who regard the human hand as the most delicate of instruments, not to be equalled, much less surpassed, by any machinery, however perfect. But we must remember, that in the operation of weaving one great essential is *uniformity* of action, that all strokes upon the web shall be of the same force, otherwise the cloth will vary in thickness, and want that even beauty so attractive in the most highly finished pieces.

It is precisely this uniformity which machinery alone can secure; for that, never tiring, performs its task with the regularity which can only be expected from an engine. Where such regularity is required, the hand being affected by the thousand muscular agencies of the body, and the emotions of the mind, can never rival the uniformity of the steam engine's stroke. Various improvements have been made in the power-loom since the days of Cartwright, but these, though important to the manufacturer, are too much involved in minute and technical details for discussion in these pages.

Here, therefore, our notice of the more important

steps in the history of the cotton manufacture must end, omitting the various processes of printing, dyeing, &c., which are rather consequent upon, than parts of, the cotton-making art. The much disputed question respecting the advantages or disadvantages of machinery to society, is one into which it would be useless to enter, our object being not to weave theories, but present the facts which have had a commanding influence on human institutions.

The factory system does undoubtedly demand the utmost watchfulness and prudence, lest it should issue in the mischief predicted by its opponents; but surely such a moral controul may be applied to those busy human groups crowded in the great hives of labour, as to prevent the disastrous consequences apt to arise from neglected masses of untaught men.

Many devices have been adopted in the large factories by which injury to human health is avoided, as may be exemplified in the improved *batting machines*, which prevent the dust from the beaten cotton escaping into the work rooms; and surely the skill of wise, christian-hearted men, can devise some means for preventing much of that moral evil, which has so justly been complained of in our factories. The old quiet life of the spinner and weaver is gone, probably for ever, since the vast combinations of machinery require the grouping of men in one spot; let us then take the factory system as a thing settled amongst us, and aim to bring it within the influence of sound moral principles. Then we may contemplate with pleasure the tall factories of the North, and view with delight the results of those inventions which will through many an age preserve the names of Wyatt, Hargreaves and Arkwright, with his who called up the mighty power-loom to receive the products of the jenny and mule.

Food and clothing are the two great physical wants of man: let us hope that the skillfully contrived machinery which provides the one, may not be a source of evil to rich or poor, to England or the world.

LIBRARIES.

THE newspapers have lately announced the death of Mr. Grenville, a statesman whose name is associated with some of the most momentous events in the modern history of the country, at the extraordinary age of upwards of eighty. And this announcement was followed in a few days by another, that he had bequeathed his splendid library to the British Museum. The circumstances under which the bequest was made are of considerable interest. Mr. Grenville, after having filled several important diplomatic appointments, lived for many years in the enjoyment of a sinecure office, the whole income of which, amounting to a considerable sum, he regularly devoted to the formation of a library, which many years before his death had become one of the most valuable collections ever made by any private individual. Its present value is estimated at £42,000; but the sum which must have been laid out in its collection, it cannot be doubted, must have been considerably greater.

It is difficult to conceive a more appropriate use of an income so derived. If Mr. Grenville received the public money without rendering any direct services in return, he at least made no selfish use of the acquisition. He was in fact a trustee for the nation, regularly and voluntarily applying a portion of the public funds to a purpose of great interest and importance, which, if left to the public itself, would certainly have been neglected. If sinecures generally led to such results, we should not be disposed very severely to censure the system.

An article in the *Quarterly Review* for May 1843, has

the following notice of the library which the nation has thus unexpectedly acquired. "The library of Mr. Grenville is in its way unique: formed regardless of cost, elegant in taste and objects, choice in editions, with just so much of rarity as makes us esteem a picture by a master whose works are numbered by tens, more than a picture of equal merit by a painter whose canvas may be estimated by acres; there never was a library more complete, in proportion to its extent, than that of this venerable statesman and scholar. In making known his treasures, which are unreservedly opened to any one who appears likely to profit by the use of them, Mr. Grenville has had the good taste, as it might be expected, to abstain from telling the world that he possesses 'a well selected library including Hume, Smollet, Gibbon, and Robertson, &c. &c.' the 'tea, coffee, tobacco, and snuff,' of the retail dealers in literature, and the auctioneers. He has had compiled a catalogue of his rarer or more valuable books, with a few short descriptive notices, often drawn from the small notes placed loosely in his volumes, which those of his friends who are happy enough to use his books, value for the information so tersely given in them."

There is, to a real lover of books, a charm in the collecting of a library, such as scarcely can be found in the acquisition of any other description of treasure. Few can indulge the taste in the princely fashion of Mr. Grenville; but, with even the most moderate income, a small sum may be set aside yearly for the purpose, which, if judiciously employed, in an earnest spirit, and with a heart set upon the pursuit, will very soon accumulate upon the modest book-shelf such a collection of curious and valuable treasures of literature, as the collector, if told of it beforehand, could scarcely have believed possible. To accomplish this there must undoubtedly be much care and discrimination exercised in selection, some self-denial in the indulgence of other tastes, and, above all, an earnest devotion to this one pursuit, giving it almost the place of a religion—such as will make the expenditure of every shilling on other objects of gratification a debated question before the court of conscience, involving the most scrupulous inquiry into the necessity for incurring it. But with these qualifications it is wonderful how much can be done. (If two men, both enjoying the same income, and with the same apparent demands upon it, we shall find one puzzled enough to make both ends meet, and finding the purchase of a newspaper and a cheap magazine quite as much in the way of literary luxury as he can indulge himself with; while the other not only keeps himself well up with the current literature of the day, but quietly adds volume after volume of the rarer and more curious occupants of the library shelf to an already tolerably valuable store; because the numberless unconsidered shillings and sixpences which the one pays away—he cannot well tell, at the year's end, for what,—are by the other religiously preserved and held sacred to this one object.

We have frequently been struck with it as a remarkable fact, with what speed and certainty books find their way, in spite of the most apparently insurmountable obstacles, to the place where there is a demand for them. We well recollect how, when at school, notwithstanding the utmost vigilance of a sufficiently severe master, who was a determined foe to all contraband contrivances for smoothing the ascent up the hill of learning, there was, among a certain set of boys—not the really good scholars, who would have scorned shirking their difficulties as a foxhunter would scorn riding round a field to avoid a stiff fence, nor the downright dunces, to whom everything was alike difficult and incomprehensible—but those whose deficiency consisted rather in want of relish than want of capacity for learning, and who, though indifferent scholars, were capital hands at finding birds' nests, a continual undercurrent of keys and translations, how procured no one could tell; for there was no shop in the town, nor within many

miles of it, where they were known to be sold. We never find, in the most remote localities, a man of a depraved or prurient taste, or of a tendency to infidel speculation, who does not manage to possess, by some inexplicable means, books fitted to minister to the gratification of such taste or tendency. And in like manner a man really possessed with an ardent thirst for knowledge, set him down in what remote and inaccessible place you will—far from any large library, and with but limited means of purchasing books, still will somehow or other manage to collect about him not merely the standard classics in that department of knowledge towards which his taste especially tends, but some books which are not to be found even by the wealthy without trouble and research. We ourselves know instances of men, in the humbler walks of life, living in small country towns, where the largest library in the neighbourhood could be hived in a single glass case, and pressed by the unintermitting calls of a toilsome occupation, who yet, by dint of an unwearying pursuit of knowledge wherever a glimpse of it could be caught, have come to acquire an amount of information on historical and literary subjects which would shame many professed scholars, and are able to boast of a familiarity with authors of whose writings the general herd of readers of books are entirely ignorant.

There is a very pleasant passage in one of Charles Lamb's delightful essays, in which, hovering, as usual with him, between jest and earnest, he enumerates the disadvantages of coming to be in easy circumstances in the case of a man who had long struggled with a limited income. He mourns over the loss of that exquisite relish, with which certain small luxuries—valued the more that the indulgence in them rather verged upon imprudence—were then enjoyed, as contrasted with the languid feeling of gratification they excited when their acquisition involved no struggle between prudence and desire. In particular he recalls to memory the purchase of one quaint old book, bought in the days of his poverty, Sir Thomas Browne's Works, or Burton's Anatomy of Melancholy, or some book of that sort; its price somewhere about sixteen shillings; long regarded with covetous eyes as he passed and repassed day after day the window in which it was displayed; and, when at last he screwed his courage to the sticking place, and actually made the purchase, the tremulous feeling of delight with which he felt, as he carried it home under his arm, that he was at last the owner of the long coveted treasure; the affectionate tenderness with which he handled it when he got home, dipping here and there into its pages, and extracting a choice morsel from each, but unable from mere agitation of delight to dwell upon any; and the pride with which he displayed it to his excellent sister, whose gentle smile expressed her full sympathy with his joy, while the slightest possible shake of her head intimated her fear that he had been extravagant. The feelings which Lamb thus portrays in his own inimitable style—a style which always suggests to us the idea of 'a smile on the cheek, and a tear in the eye,'—must be recognised as exquisitely true to nature by almost every poor lover of books.

The article in the Quarterly Review to which we have already referred contains a good deal of very interesting information on the subject of libraries, library collectors, and books. On the subject of British libraries the author says, "The Bodleian and other libraries of Oxford, the libraries at Cambridge, Edinburgh, and Dublin, will rank with many of the continental collections. The Harleian library of printed books, formed by Lord Treasurer Oxford, and his son the second earl, has, like the library formed by the Duc de la Vallière in France, been dispersed, but the catalogues of each remain to testify to their merits. The Sunderland Library, so rich in vellum copies of *Éditiones Principes*, is still preserved at Blenheim; and the truly regal collection formed by King George III. out of his privy purse, and so munificently presented to the British nation by

King George IV. is kept intact at the British Museum. Immediately upon his accession to the throne, King William IV. commenced the formation of a new library; various collections belonging to the crown were brought together and amalgamated; many deficiencies have since been supplied by judicious purchases silently and unostentatiously made; and already Her Majesty and her illustrious consort appreciate and enjoy at Windsor Castle a splendid library of 35,000 volumes, occupying the whole of Queen Elizabeth's Gallery, and King Henry the Seventh's and King Charles the Second's rooms; to which library is attached an almost unrivalled collection of drawings by the ancient masters, including that of Cardinal Albani. The Roxburghe collection has, by its dispersion, enriched the noble libraries of the Duke of Devonshire, Lord Spencer, and Mr. Grenville, all of them, but particularly the last, formed with regard to the value of the books, and not the number of the volumes, numerous though they be. We doubt if all Europe could produce another individual gentleman who in his ardour for collecting books and manuscripts, has disbursed, like Sir Thomas Phillips £100,000, or 2,500,000 francs."

On the effects upon literature of the book-collecting mania, the writer of the article thus remarks:—"The passion for collecting books which many individuals have displayed has, all things considered, worked well for literature; to the credit of book-collectors it must be said, that in general their stores have been available to the use of others. Some collections formed by distinguished bibliomaniaes, to use Dr. Dibdin's phrase, yet remain entire; others dispersed after their owner's death, have enabled many a student to obtain some rare volume necessary to the perfection of his subject. Roscoe acknowledges his obligations on this account to the Crevenna and Pinelli sales. Of the libraries so dispersed some are on record in a good catalogue, whilst others perhaps of greater merit are almost forgotten, '*carere quia vate sacro*.' The late Mr. Heber accumulated a vast library, or rather, a chaotic mass of books, which, certainly from no want of liberality in the possessor, but from various circumstances, produced in his lifetime little good. He had some few favourite classes of literature which he endeavoured to complete; but in general all books were books to him, and greedily purchased. He stopped not at duplicates, nor triplicates, nor at a tenth copy. Of this library, the labour of a life, the expenditure of a fortune, what remains? Some fifteen auction catalogues, with several alphabets in each, all drawn up in haste for the merely temporary use of vendor and purchasers, and for all purposes of consultation perfectly useless. The late Frederick, Earl of Guildford, began early to collect books, and after his return from the government of Ceylon, indulged his penchant largely in the literature of Southern Europe. During his visits to the Continent he purchased the entire libraries of convents; and his collection was singularly rich both in printed books and manuscripts of Italian and modern Greek literature. His aim was to found a university in Corfu, and to deposit there his library. However, upon the earl's death it was dispersed by auction, and like Mr. Heber is now known only by three or four meagre and ill-digested sale lists. The greater portion of his MSS. are in the British Museum and in Sir Thomas Phillips's library."

We have in the same article an interesting statement of the number of books contained in the principal libraries of Europe. "The number of volumes claimed to be possessed by the twelve greatest libraries of Europe is as follows (quoted from the Appendix to the Parliamentary Report on the British Museum). The *Bibliothèque du Roi*, at Paris, 650,000; Munich, 500,000 (of which one fifth at the least are duplicates); Copenhagen 400,000; St. Petersburg 400,000; Berlin 320,000; Vienna 300,000; the British Museum 270,000; Dresden 250,000; the *Bibliothèque de l'Académie*, at Paris, 200,000; the *Bibliothèque de St. Genevieve*, at Paris, 200,000; the

Brera library, at Milan, 200,000; Göttingen 200,000." The accuracy of these numbers, however, is very uncertain. It is not clear that the numbers of volumes in those libraries have ever been actually counted, nor that the same principles of enumeration have been adopted, so that those libraries to which the largest numbers are attached may not be really so much larger than some of the others as would at first sight appear. It has been calculated that the printed books in the British Museum Library occupy ten miles of shelf. It contains 60,000 pamphlets on the subject of the French Revolution alone.

One of the greatest difficulties connected with the management of a library, is the preparation of proper catalogues. It is somewhat amusing to see how the difficulty has been increased by the practice so common among authors of disguising their real names. "Besides the frequent solecisms which are found in alphabetical catalogues, arising from the compiler's misapprehension of the meaning of a title, such as the '*Relatio felicitis agonis*' of certain martyrs, being entered as a work by Felix Ago, various difficulties are caused by the fond fancies of authors in translating or euphonising their names. The variety of modes by which names are altered and disguised is great; those which sound harsh or too familiar in their vernacular form are often euphonised by being turned into well sounding Greek: thus, Melancthon, Capnio, Xylander, Ecolampadius, Metastasio, represent Schwartzerd, Reuchlin, Holtzman, Hausschein, and Trapassi; Sophocardius is Wishart, or Wiseheart; and Hylacomylus, who first gave the name of America to the then newly discovered continent, is only Martin Waldseemüller, a schoolmaster at the little town of Saint Die, in the department of the Vosges. But one version does not always suffice: Giovanni Vittorio de Rossi, Johannes Victorius de Kubeis, and Janus Nicius Erythreus, are all one and the same person, who writes under the three names. Sometimes a Latin form is taken, or an equivalent it may be: thus Bevilacqua, or Drinkwater is Abstemijs, Bridgewater is Aquepontanus, Torquemada is Turrocremata, Smidt is Vulcanus, Leger Duchesne is Leodegarius a Queren, or Quercetanus, and Vander Bycken is Torrontius. If without meaning, or almost incapable of being tortured into meaning, the cacophonous name is made to sound like Latin: Van der Does is Douas, Roscoe is Roscius, Owen is Andoenus, and Wilson Volusenus. In English a somewhat similar process is adopted in order to get rid of an objectionable name: for instance, Abraham is made Braham, Israel d'Israeli, Bernales Bernal—and a total change of name is not unfrequently resorted to for the same purpose. The number of writers of one and the same name is another source of error; it would be no easy task to discriminate accurately between all the John Smiths, the Thomas Browns, and the William Allens. These difficulties have caused some writers, such as Fabricius and Nicolas Antonio, who have cast their works into an alphabetical form, to arrange their matter under Christian or first names; but here a new class of obstacles arises, whether John shall be Johannes, Heri-Gratia, Theocharis, Giovanni, Jean, Johann, Juan, Joao, Joan, Jonas, or Hans—whether we shall say Egdius or Giles, Ludovicus or Lewis or Louis, Elizabetha or Isabella, Wilbott or Bilibaldus."

Another source of error and confusion in assigning books to their true authors arises from the practice of authors concealing their names in acrostics and similar puzzles. Of these one of the most curious was the following. "Th—s Cl—s: Midras *Iacoeus*." This might have puzzled Oedipus himself, had the author not furnished the key to his meaning. The word *Midras* he says, is to be read by the word Iacous: then as i is the third vowel, a the first, o the fourth, e the second, and u the fifth, M. i. d. r. a. s. will be transposed into I. R. M. D. A. S. which initials stand for Johannes Robertson, Medicine Doctor, Abredonensis Scotus:—the Th—s Cl—s being not Thomas Clowes, nor any

relative of our printer, but Theodoris Cleobulides, which purports to be a translation of John Robertson."

The article goes on to enumerate other curious sources of mistake arising from the ignorance of editors and bibliographers. One editor, out of King James's Doron Basileon, creates an author, Dorus Basilicus; Bishop Walton, editor of the Polyglott Bible, out of the title of the great Arabic dictionary, the Kamos, or "Ocean," makes an author, whom he calls Camus. The Centones Virgiliani of Proba Falconia, were printed in 1509 at Paris, as by Proba Falconia Centona; and the Catalogue of the Barberini Library, turns the German *weiland* into an author of the same name.

Some ages hence, if the favourites of the present day live so long, similar confusion may arise from the practice now prevailing of adopting pseudonyms. There will be no difficulty about Sir Walter Scott, so long as our language survives; the most ignorant catalogue-maker will scarcely attribute any of his works to Waverley, Dr. Dryasdust, or Jedediah Cleishbotham; but we should not wonder, if some difficulty did arise in adjusting the respective claims of Wilson and Christopher North, Dickens and Boz, Procter and Barry Cornwall, or Thackeray and Michael Angelo Titmarsh.

INUNDATION OF THE VALLEY OF BAGNE.¹

The valley of Bagne, long, narrow, unequal in breadth, and confined by high mountains, is situated in the canton of Valais, on the left side of the Rhone; and it is remarked of the simple and industrious race who inhabit it, that for a century past there has not been a punishable crime committed among them, nor even a law-suit. The torrent of the Dranse, issuing from the glacier of Chermontane, at the upper extremity of this valley, forms one of the outlets of that series of glaciers, forty leagues in length, which extend from Mont Blanc to the sources of the Rhone; almost dry in winter, it becomes swollen during the spring, by the melting of the snow. The people of the valley, surprised to see it always so low during the month of April last, and suspecting something extraordinary, ascended to its source, and found that an unusual quantity of ice, fallen from the glacier of Getroz, on Mount Pleureur, blocked up the valley, and that the waters of the Dranse, accumulated behind this dyke, already formed a large lake. Upon their report, the alarm was spread, not only throughout the canton of Valais, but even in Italy; travellers feared to take the route of the Simplon, being aware that when the ice gave way there would be a sudden inundation, which would overflow the whole country. The government sent an engineer, who found that the dyke across the valley was six or seven hundred feet in length, four hundred feet high, and three thousand feet broad at its base; the lake was seven thousand two hundred feet in length, and six hundred in breadth, and had already risen to half the height of the dyke, that is, to two hundred feet. He decided upon opening a gallery through the ice, beginning fifty-four feet above the actual level, to give himself time to finish the work before the lake rose up to it; its daily increase being from four to five feet, according to the temperature. On the 11th of May he began to work at the two extremities of the gallery, fifty men, relieving each other alternately, laboured night and day, in continual danger of being buried alive in their gallery by some of the avalanches, which fell at short intervals; several were wounded by pieces of ice, others had their feet frozen, and the ice was so hard as to break their tools. But, notwithstanding all these difficulties, the work advanced rapidly. On the 27th of May, a large portion of the dyke rose upwards, with such a frightful noise, that the workmen believed the whole was giving way, and fled precipitately, but soon returned to their labour.

(1) From Simond's Switzerland.

This accident happened several times afterwards; some of the floating pieces of ice, to judge from their height out of the water, must have been seventy feet thick beneath the surface. The 4th of June the gallery, six hundred and eighty feet long, was completed, but, as it was twenty feet higher in the middle. It was necessary still to level it. The weather had been very cold, and the lake had not yet reached the height of the gallery; the labourers, therefore, continued lowering it till the 13th, when, towards ten at night, the water began to flow through. The lake continued to rise during several hours; but the next day, at five o'clock in the evening, it had fallen one foot; the morning on the 15th, ten feet; the 16th, thirty feet.

At two o'clock on that day, the length of the lake was diminished one thousand nine hundred and fifty feet; for the gallery wearing down as fast as the lake lowered, the water ran freely, but without the Dranse overflowing; and a very few days would have sufficed to drain this great reservoir. Loud explosions, however, announced that large masses of ice were loosened from the dyke by their specific lightness diminishing its thickness towards the lake, while the current, as it flowed from the gallery, wore away this same barrier on the opposite side, and threatened a sudden rupture. The danger increasing, the engineer sent, from time to time, to warn the inhabitants to be on their guard. As the water began to make its way under the ice, the crisis appeared inevitable, and not far distant. At half-past four in the evening a terrible explosion announced the breaking up of the dyke; and the waters of the lake rushing through, all at once formed a torrent, one hundred feet in depth, which traversed the first eighteen miles in the space of forty minutes, carrying away one hundred and thirty chalets, a whole forest, and an immense quantity of earth and stone. When it reached Bagne, the ruins of all descriptions carried along with it formed a moving mountain, three hundred feet high, from which a column of thick vapour arose, like the smoke of a great fire. An English traveller, accompanied by a young artist, Mr. P. of Lausanne, and a guide, had been visiting the works, and on his return was approaching Bagne, when, turning round by chance, he saw the frightful object just described coming down, the distant noise of which had been lost in the nearer roar of the Dranse; he clapt spurs to his horse to warn his companion, as well as three other travellers who had joined them; all dismounting, scrambled up the mountain precipitately, and arrived in safety beyond the reach of the deluge, which, in an instant, filled the valley beneath; however, Mr. P. was no longer to be found; during several hours they believed him lost, but they learned afterwards that his restive mule, turning at the sight of an uprooted tree, perceived all at once a still more threatening sight, and dashing at once up the mountain, had carried him beyond the reach of danger.

From Bagne the inundation reached Martigny, four leagues in fifty minutes, bearing away in that space thirty-five houses, eight wind-mills, ninety-five barns, but only nine persons, and very few cattle; most of the inhabitants having been on their guard.

The village of Beauvernier was saved by a projecting rock, which diverted the torrent; it was seen passing like an arrow by the side of the village without touching it, though much higher than the roofs of the houses. The fragments of rocks and stones deposited before reaching Martigny, entirely covered a vast extent of meadows and fields. Here it was divided, but eighty buildings of this town were destroyed and many were injured; the streets were filled with trees and rubbish, but only thirty-four persons appear to have lost their lives at Martigny, the inhabitants having retired to the mountains. Below Martigny, the inundation spreading wide, deposited a quantity of slime and mud, so considerable, as it is hoped will redeem an extensive swamp. The Rhone received it by degrees, and at different

points, without overflowing, till it reached the lake of Geneva at eleven o'clock at night, and was lost in its vast expanse, having gone over eighteen Swiss leagues in six hours and a half, with a gradually retarded movement. The bridges having been carried away, all intercourse was interrupted during several days, between the inhabitants of the opposite banks of the Dranse, whose only means of conveying intelligence of their misfortunes to one another, was by throwing letters fastened to stones. This is not the first accident of the kind; there are traces of others, and one is supposed to have taken place in the year 1595, a beam in the ceiling of a house at Martigny, bears the following initial inscription:—M. O. F. F. 1595, L. Q. B. F. I. P. I. G. D. G. of which the following ingenious explanation was given:—Maurice Olliot fit faire, 1595, lorsque Bagne fut inondé par le glacier de Getroz.

It is somewhat remarkable that an old man, ninety-two years of age, saved himself by ascending a mound, supposed to have been formed by the former inundation; the present one pursued him to the summit, where he maintained himself by the aid of a tree, which was not carried away.

Poetry.

[In Original Poetry, the Name, real or assumed, of the Author, is printed in Small Capitals under the title; in Selections, it is printed in Italics at the end.]

THE DEAD MAIDEN.

W. BRAILSFORD.

STREW flowers here,
Never mourn beside her bier;
She was very young and fair,
Small communion had with care;
In her blue eyes dwelt such love
Of the glorious heavens above,
That she seemed a worshipper
Of each brightly beaming star;
Woods, and fields, and leafy dell,
Shaded lane, and mossy cell,
To her simple heart were dear,
Loving in its own sweet sphere.
Do not weep
For this angel so asleep!
See! a smile is on her face,
As it found her praying grace;
Never sorrow came a-near,
Never anguish caused a tear;
But the flowers of her mind
Were of life's first hues combined;
Blooming, fresh, and very fair,
As these stainless features are;
Oh, be sure a living Spring
Quickened in this silent thing.
Never sigh,—
It was best that she should die;
So to perish, so to part,
With the *godlike* in her heart;
So to leave the world beneath,
Fearless at the touch of Death;
But with thoughts of calm repose,
As the summer flowers close,
Silently her life has past—
We have loved her to the last;
O'er her calm and tranquil end
Maidhood in its pride might bend.
Never turn
From these cold remains, but learn
How her gentle life was spent,
In a short embodiment
Of all sweetest nature, lent
With a blessed true content.
Earth hath lessons yet to spare,
Stored greatness over there,
But this cold unparted eye
Highest teaching can convey.
Never weep, or weep, or sigh;
Let her slumber quietly.

Miscellaneous.

WHEN the British finally took possession of Kandy, in February 1815, shortly after the tents had been pitched, in the immediate vicinity of the capital, Mr. Marshall, who was staff-surgeon with the army, "was addressed in English by a brown-coloured man in the native costume. Upon inquiry, it was ascertained that his name was Thomas Thoen, a German by birth; that he belonged to the Bengal artillery, and accompanied the expedition to Kandy in 1803, and that he was a patient in the hospital when Major Davic capitulated to the Kandians, on the 24th June. When he was asked how he had retained a knowledge of the English language, having for such a number of years associated with Kandians only, 'I being a foreigner,' said he, 'never could speak the English language correctly; but having found a few leaves of an English Bible belonging to one of the soldiers, I read them occasionally, and by that means preserved some acquaintance with the language.' The writer conducted him to Major Hook, by whom he was conveyed to head-quarters, and introduced to his Excellency.

"Of the sick who were left in the hospital on the capitulation of Kandy, in June 1803, Thomas Thoen was the only one who escaped with his life. Along with the other patients, he received a blow with the butt-end of a musket, which felled him senseless to the ground, and he was thrown among the dead. Having recovered from the effects of the blow, he crawled to a place of concealment in the neighbourhood, but being discovered next day, was hung up to the branch of a tree. The rope, however, broke, and he fell to the ground; he was again suspended, the people left him, and again the rope broke. He contrived to find his way to a hut at no great distance, where he continued for ten days, with no other sustenance than the grass which grew near the door of the hut, and the rain which dropped through apertures of the roof. At the expiration of the above period, an old woman entered the hut, but, seeing Thoen, instantly disappeared. To his great surprise she soon after returned, bringing with her a dish containing a quantity of dressed rice, which she left on the ground, and went away. Next morning Thoen was taken before the king, who, struck with the singularity of his fate, observed, that it was not for man to injure one who was so evidently the favourite of Heaven. The king then ordered that he should be supplied with food, giving him at the same time in charge of one of the chiefs, with strict injunctions to treat him with kindness and attention. A house was allotted to him in Kandy; and he, after some time, married the daughter of a Moorman, a circumstance which, he told the writer, contributed greatly to his comfort. General Brownrigg appointed Thoen to a suitable situation in Galle, where he soon after died."—*Marshall's Description and Conquest of Ceylon*, p. 155.

The Red-Cross
Knight.

THE RED-CROSS KNIGHT.

"Blow, warder, blow thy sounding horn,
And thy banner wave on high!
For the Christians have fought in the Holy Land,
And have won the victory."

Loud, loud the warder blew his horn,
And his banner waved on high;
Let the mass be sung, and the bells be rung,
And the feast eat merrily.

The warder look'd from his tower on high,
As far as he could see:

"I see a bold knight, and by his red cross,
He comes from the east countree."

Then loud the warder blew his horn,
And call'd till he was hoarse:

"I see a bold knight, and on his shield bright
He beareth a flaming cross."

Then down the lord of the castle came,
The Red-Cross Knight to meet,
And when the Red-Cross Knight he espied,
Right loving he did him greet.

"Thou'rt welcome here, dear Red-Cross Knight,
For thy fame's well known to me;
And the mass shall be sung, and the bells shall be rung,
And we'll feast right merrily."

"Oh, I am come from the Holy Land,
Where saints did live and die;
Behold the device I bear on my shield,
The Red-Cross Knight am I!

"And we have fought in the Holy Land,
And we've won the victory;
For with valiant might did the Christians fight,
And made the proud Pagans fly."

"Thou'rt welcome here, dear Red-Cross Knight,
Come, lay thy armour by:
And for the good tidings thou dost bring,
We'll feast us merrily.

"For all in my castle shall rejoice
That we've won the victory;
And the mass shall be sung, and the bells shall be rung,
And the feast eat merrily."

Evans' Old Ballads.

THE SHAWL MANUFACTURE OF PAISLEY.

THE stranger in Paisley, while he gazes with mingled awe and admiration on the great roof of the ancient abbey, can scarcely fail to ask with surprise what large modern roof it is that aspires, in the immediate vicinity of the venerable fane, to rival its large and looming bulk. He is speedily informed that this last is the factory of Mr. Robert Kerr, at Seedhills, dedicated, along with Mr. Kerr's other extensive premises in Thread-street, to the great shawl trade of Paisley; and forming together, these magnificent ranges of buildings, the largest shawl manufactory in the town. Those who possess interest sufficient to get themselves conducted over these works, which is, necessarily, no easy matter to accomplish, need go no further into the details of local industry in Paisley, as they will find them all represented here—not in epitome, but on the grand scale.

Mr. Kerr's great factory at Seedhills, over which we were first conducted, on occasion of a recent tour, through his shawl manufactory, forms an oblong square, one end and side of which are enclosed by a superb new building of four spacious floors, ranging about 330 feet from end to end;—the other sides of the square are hemmed in by the dye and print-works, and relative departments.

Immediately at the gate is the print-dye work, a branch about to be newly undertaken by Mr. Kerr, he having many years ago introduced the printing of the warps of a description of goods called *Chinies*, of which the warps were printed, and the wefts not, and which goods were, for a time, highly popular. We found the house in which the preparation of the dyes for printing takes place, stored with all descriptions of chemical or dyestuffs' materials, amongst which we may enumerate sal ammoniac, logwood, indigo, oxalic acid, crystals of tin and ammonia, cream of tartar, alum, Persian and Turkey berries, double muriate of tin, prussiate of potash, red prussiate of potash, sulphuric acid, gums, and gum substitutes. The different colours for printing upon cloth are produced and fixed by the use of these and similar ingredients in several combinations; some of which exhibit very pleasing and amusing chemical transformations of colour. The facts connected with the chemical combinations of colour, are generally known to artists and men of science; but the great secret in laying in colours in printing upon cloth,

consists in the previous preparation of the cloth itself.

Passing forth from this place of drugs and dry-salts, we alighted on a magazine of fuller's earth, used for cleaning tartans; which recalled to our recollection a patent lately taken out by Mr. Kerr for a process devised by one of his workmen, whereby, instead of one shawl or piece of cloth, several may now be full'd at a time. Alive to the immense facility thus afforded, Mr. Kerr instantly secured the invention by patent, and handsomely rewarded his workman for his ingenuity.

The block-cutting apartment, which we entered next, presented the usual features of engraving on wood—the pattern being first drawn in bright red upon the block, and the figure raised in relief by cutting away the blank portion: the wood used is what is popularly termed plane tree, or American maple, in the superficies of which the figures are raised in relief, to the height of fully one-eighth of an inch. As many as nine or ten dozen differently shaped tools are required in block-cutting, owing chiefly to the diversity of angles that occur: seven dozen of these tools are commonly gouges; the rest, pinkers, files, twistern, cruikeys, &c., employed respectively in the cutting and picking out of the figures;—a small instrument called a gauge, (from its measuring off thicknesses by means of screws) containing relative screw-pins, vices, saws, cutters, &c., is used for taking the sizes to which bits of copper are sawn, when, as is sometimes the case, these are introduced in relief upon the face of the block instead of leaving the figure in wood. These figures of copper, which, after being thus cut, are knocked as far into the block as they project from it, are employed to produce a finer and sharper mark in printing, and are chiefly adapted to calico or cotton printing, woollen cloths presenting a rougher surface, and neither requiring nor admitting of very fine outlines. Figures for insertion in the blocks are sometimes also formed of brass wire; and this is accomplished, not with the peculiar instrument above named, but by pressing the pieces of wire while red hot through a steel plate, in which the proposed figures are first formed by a punch representing them, hardened or tempered, and struck into the plate while soft. In this way the plate is perforated so as to represent the required figure graduated down to the exact given size. The plate itself being then tempered or hardened, the

brass wire while heated is forced through the figure-holes of one size after another, till brought to the exact size required. This art of making printers' blocks, is, like many other departments, a branch of art completely by itself; and demands an apprenticeship of seven years to acquire it; and even that is no more than sufficient to render the cutter fully skilled in his art.

Proceeding next to the Yarn Dyeing House, the eyes and olfactories are here at once saluted with a peculiar contrast of sights and smells; all that is bright and beautiful in colour, from the deepest blushing crimson to the divinest blue, seems to indicate, that the ancient ambition of man to rival the plumage of the feathered creation, and array himself in Tyrian dyes, is not yet extinct. The range of this large dyeing house is at least 150 feet long, beneath one roof, and not including the adjacent warehouse, colouring store, &c. Streams of liquid dyes discharged from the numerous vats are constantly pouring along the centre of the floor. With regard to the process which the yarns here undergo; woollen yarns are first scoured in ammonia, soap, &c. Some colours also demand the yarns to be previously prepared for their reception: and, in general, cotton yarns are previously boiled in water; spun silks tossed in boiling water; and tram silks boiled in soap to extract the gum. The skeins of yarn are then hung upon dyers' pins, and dipped in the vats or boilers. These vats are of cast iron, six and a half feet deep; some of them, for hot dyes, have a flue passed through them. Scarlet yarn is dyed in one hour, one man at each side of the boiler turning over the skeins. Some colours require a greater length of time. The woollen yarns are all done warm; the cottons all cold; and the latter require several dippings, which is sometimes even the case with the woollens, as in dyeing wood-blue, which we saw in process, requiring two or three dippings. In these last instances the dyer keeps advancing from the weaker to the darker colour until the full shade is obtained. After being dipped in the dye, the yarns are washed, mostly in cold water we believe, although here (in Mr. Kerr's) warm water is generally used. Most yarns require immediate washing, excepting such colours as improve by an access of oxygen from the atmosphere. When the dyeing is finished, each skein is wrung well out on the dipping pins, and thus becomes ready for the drying stove, where it remains hanging upon poles usually from afternoon till next morning, subjected to a temperature of 100°, 110°, or 120° Fahr. Nothing more remains to be done with the yarn in this department than making it up into bundles.

A description of the factory will show, without entering into the intermediate details, how these brilliant yarns are ultimately disposed of. The factory consists of four floors, three of which are filled with double rows of the most splendid and substantial, we could even add elegant, looms; the fourth is for the beaming house and flower lashers, and thither we shall first proceed, as it is there that the yarns are adapted for the loom.

The flower-lashing is done by men and girls; and the patterns drawn upon design paper being put down before them on a frame, exhibit at a glance the distinct colour of every thread. Upon this frame are stretched cords called simples, one for every thread, whatever its colour, represented in the pattern. A twine called a lash twine is passed through amongst the "simples" on the frame, so as to isolate each one of the same colour from the general mass. The "tacks" or "lifts" of each distinct colour are afterwards assembled together into one "lash;" so that, when this lash is pulled by the draw-boy at the loom, or at the card punching machine, the whole of one particular colour in the portion of the pattern at which they have arrived can be thrown into the web by the weaver's shuttle, or represented by the punching machine upon the card. These cards are cut by a punching machine, mounted in exact conformity to the harness of the weaver's loom, so as to supersede the action of the draw-boy. The card punch-

ing machine is itself worked by the aid of a draw-boy, and holes corresponding to the different colours representing the weaver's "shots" are thereby punched out upon the cards successively. The cards being put together in order, are deposited at the side of the loom, mount one by one to the top of it, and there becoming for a moment fixed upon pins, each in its turn admits of the portions of a particular colour represented by its perforations, somewhat as musical notation represents sounds, being communicated to the fabric in process.

We entered one of the other three floors of this huge factory, on one side of which we observed a range of upwards of thirty plain looms in full operation upon tartans, &c.; the rest, upon the other side, and we believe also on the other two floors, were Jacquard harness looms, or simply Jacquard looms. Each weaver had suspended at his handsome loom a large hand-fan of quills, used for drying the dressing put upon the web. This is the old form of fan, which has been reverted to; at one time a circular revolving fan was attached to the side of the loom. Here shawls of all kinds were in process of being woven.

We were very much interested in observing Mr. Kerr's patent double shawl in progress at several of the Jacquard looms. It was worked with as much apparent ease as the single fabric, although by this wonderful invention two complete and entirely different shawls were worked off at one and the same time. We understand that the weaver is paid considerably higher in consequence of having to go through more material, and harder work. There is a machine for splitting, or cutting separate the two shawls, which are thus woven back to back. And it is not a little remarkable to observe, on comparing what ought to be the corresponding portions of each shawl, that their colours are relatively reversed. Thus the white of the one, which we saw finished at the loom, is represented by amber colour in the other; the scarlet by black; the dark blue by light blue; and the light blue by green! These are triumphs of textile skill, which Mrs. Arachne, when "her many-coloured web she wove" in competition with Minerva, dreamt not the goddess of invention had in store against her, else she never would have made the rash attempt.

Every body has heard of Mr. Kerr's production of a beautiful portrait of Louis Philippe, King of the French, in silk, by the loom, which the connoisseur of the fine arts can hardly distinguish from the finest line engraving. We need not therefore repeat that this is effected just as any other pattern, perhaps less complicated, would be interwoven in a shawl. The principle involved in this production has since been carried out by Mr. Kerr in a magnificent vest-piece, which we have seen.

But amidst these triumphs of our native art there was one feature of this busy hive of industry indelibly impressed upon our mind. It was the abundance of employment that the enterprise of one individual thus scattered around him; and we came away, saying of him, what the visitor of St. Paul's ejaculates respecting its architect, "*Si monumentum quaris, circumspice.*"

The warehouse and relative works of Mr. Kerr, in Thread-street, occupy a front range of building, comprising four floors, with several additional houses in the rear. On entering by the front, you gain the counting-house, the service rooms, the sale rooms, and green store rooms, all on the ground-floor. The service rooms are interesting, as being the places where goods are taken in from the weavers, and wett given out to them. The rooms for green stuffs are where undyed stuffs of all sorts are kept. Immediately above, up-stairs, are stuff-rooms for dyed yarns, having hatches communicating with the service rooms below, and a hatch in the lobby, to receive up the stuffs from the dye-house.

In a part of these last rooms, intended to be laid off exclusively for a pattern-room, we observed *Grillet's Patent Transfer Machine*, a French invention. It consists merely of a strong reflector, which, throwing

the pattern painted on oil paper down upon design paper, placed below, enables the pattern, magnified to such extent as may be desired, to be retraced anew by the hand. The scale of magnitude is graduated by the distance apart of the pattern and shadow. In the adjoining chambers numerous pattern-drawers and designers are at work, producing, transferring, or filling in, the colours of patterns on design paper.

Returning to the service rooms, we were shown many bundles of patterns, either in actual use, or newly introduced and about to be used. They were all excellently conceived.

Before trusting ourselves amidst the dazzling "field of the cloth of gold," which we were aware was near at hand, displaying the *Paisley Manufactured Shawl* in all its variety, beauty, and magnificence, we thought it proper to investigate minutely the mode in which a single shawl is made up.

Tabular views of the intended succession of colours in a shawl are first drawn upon paper in what are termed "weavers' tickets," showing at a glance the procession of the colouring each way, lengthwise and breadthwise, from end to end and from side to side of the shawl. Calculated in splits of two threads each, these "weavers' tickets" exhibit the exact way in which the dyes throughout the shawl are to occur when woven. To furnish an idea of the minuteness of these "tickets," or tables, we may mention having examined a shawl of 1600 splits down and up, i. e. 3200 splits or 6400 warp threads in all. The "ticket" commenced with dividing off ten of these "splits," to be dyed in a particular manner, viz. ten inches of them *black*, seventy-two inches *maroon*, and ten inches *black* again, making up the full length of the shawl, including its fringes. There were thirty changes different from the down and up, or sixty such changes in all, in the breadth of this web. And so minute were all these subdivisions of colouring, that, for example, the ten splits above-mentioned, when put together, formed, in a web of this fineness, not exceeding a quarter of an inch of one colour in the width of the cloth. Some portions of one colour were more extensive, varying, perhaps, from eighty and 100 to 350 splits. The card or "weavers' web draft," being thus concocted from the pattern peculiar to a shawl, the necessary yarns are next given to the warper, by whom the web is thereupon warped wholly in white—only the warper previously measures off, knots upon a thread, and ties with a coloured string, the different measurements of colour indicated on the "draft." By this means the warper is enabled to warp off each proposed colour into a chain by itself, and not only so, but to keel or mark upon that chain, each termination of that succession of colour, being the number of races or times this one colour runs up and down through the whole web. The yarns in coming from the warper are arranged and screwed down into the slides of a machine or frame, and dyed accordingly; each warper's chain of yarn being dipped as many times as it represents different colours or grounds throughout the length of the shawl—those in the width of it being separated, as already intimated, in order to be dyed into different colours. It will readily be believed after this, that the value of the preparing up to this stage is actually equal to the value of the silk itself.

We may now venture in amongst the "bright tissues" themselves. Nature has set the example in almost every branch of art, and in none more explicitly than in weaving.

"The web in the leaves,
Which the spider weaves,"

is certainly an ingenious fabric; but man, the most ingenious of fabricators, is not to be outdone by it. To the rainbow tints which are sometimes shown in the web of nature—the prismatic refractions of the simple ray of light—man has superadded the exquisite art of design, which in the composition of curves to please, arrest, and satisfy the eye, as well as in the blending

the contrast and shading of hues, is really worthy of "the paragon of animals." In Mr. Kerr's warehouse,—the undoubted fountain-head of beauty and elegance in Paisley manufacture,—we anticipated an ample illustration of this, and could not help demanding as we entered—

"Come show us the rose with a hundred dyes,
The lily that hath no spot,
The violet deep as your true love's eyes,
And the little forget-me-not."

We beheld, and were astonished! Decided figures, it is true, are what the art of textile design delights not in. The graceful curvature of its pines, where alone of all figures yet invented the requisite symmetry and decision are combined, give the only certain decision of character that can almost be ventured upon in the shawl pattern, and can hardly be dispensed with; although we certainly met with elegant patterns entirely destitute of the pine curve, amongst those superb products of the loom we had the pleasure of inspecting; and we observed, also, that at this establishment considerable grace has been added to the shawl pattern, not only by a freer disposition of the pines themselves, but by sometimes enlarging the pattern, or pursuing the idea of a design beyond the circumscribed limits to which it has hitherto been restricted, and running it in a belt through some extent of the fabric. The effect and felicity of this idea is inconceivable to such as have not examined shawls into which it has been introduced.

Our eye first lighted on some rich *White Crape Shawls*, woven plain, but subsequently embroidered by the hand in the adjacent county. Some of these shawls were of great value; and the embroiderers alone would receive sometimes as much as five or six guineas for a single shawl. We saw one, the embroidery of which cost 110 shillings. Besides these handsome white shawls of flowered embroidery, there were crimson and coloured shawls of the same description. All, in fact, that the French have done in crapes has never, to this day, come up to what is done in Paisley. Even the China crapes are approached nearest by those of Paisley. The fringe of one of these shawls is of about 17. in value. The manufacturers receive for them as high as twelve guineas from the retailer; who, of course, sells them much higher. It is about twenty-five years since the making of these crapes was first introduced into Paisley, where a capital trade in them subsisted for some years, but afterwards declined; and an effort, which we trust may prove successful, is at this moment making to revive it. The beautiful shades before us evince that that effort is no unworthy one; and in this instance the entire manufacture, from the raw material to the finished shawl, is done upon the premises—the silk being "thrown," wholly prepared, woven and finished, from the first stage to the last, all within the house!

Silk Gauze Shawls, of bright streaming colours; a well known branch of Paisley trade, under which exclusively Fulton's house flourished for an entire century, while the town at large produced little else, are still made in great delicacy and splendour. A specimen termed "Aerial," shown at the Corn Law League Bazaar, in Covent Garden Theatre, attracted great admiration.

Figured Satins, even, are worked in Paisley. These exhibited the novelty of having the colour thrown in upon the ground, so as to disguise it in the centre in the same manner as in the border of the shawl. In one shawl which we saw, the ground was in reality black, but had been woven over with blue; the bordering included four distinct colours.

A most gorgeous variety of *Lace Shawls embroidered* in colours, were shown us; not only in black lace, but in crimson, and all varieties of ground. The splendid embroidery on these was diversified to the extent of eighteen or twenty colours to a shawl. It is gratifying and interesting to know, that it is executed exclusively

in Renfrewshire, generally in the country around Paisley; as, for instance, in the rural village of Kilbarchan and its vicinity. Instead of drawing off the female portion of the rustic community from domestic avocations, as it has sometimes been alleged manufactures tend to do,—it is pleasing, and in some shape astonishing, to find the very girls engaged in this magnificent handiwork, which the Scriptures of old assigned to “kings’ daughters,” and in which the aristocratic recluses of the ancient nunneries revelled, frequently called upon to lay it aside for the more pressing emergency of proceeding—to *milk the cow!* And yet these shawls are, as we state, brilliant, splendid, gorgeous, in the full flush of natural colouring—if not something beyond—for art, we well know, is permitted to exaggerate. For these few years the French have tried this branch of art; but still we can manage to compete with them, notwithstanding its congenial character, and—the low duty.

Barege Shawls are entirely woven, being a species of gauze. They are made both in squares and long, and of various colours. Through the black ground of some of them a finely-wreathed flowery pattern of white is run, like a “sable silver’d.” They are very handsome of any colour, whether white with black, light blue with white, or whatever contrasts will correspond with the style.

Some massive *Harness-wove black satin shawls*, it surprised us to learn, were all done in the loom,—including even one isolated figure raised in embroidery! This figure is literally sewed in the harness-loom by the shuttle, and we were told consisted all of one thread.

There were also very rich and very handsome “*Eighty-hundred satins*,” done with alternate stripes of primrose and lavender, or of crimson and green, interspersed by similar interspaces of a black ground, in fine combination.

Some very curious *striped silks* were in alternate brilliant stripes of plain ground and figure, in which a substitution of warp actually takes place in working the figured stripes. The plain warp behind the figures is in this case never interfered with, for the figured stripes receive warps of their own, and the plain warp behind, at these parts floating loose, is afterwards cut away! The figured stripes generally present a diversity of eight colours, and are very gay.

Figured Bareges have generally a strongly contrasted plain pattern, as white upon black, &c.

We saw *Crape Shawls*, elegantly contrasted in the same way, having raised on their surface an embroidered figure done in the web.

The scarfs called *Grecian Scarfs* are exceedingly brilliant, and rich in their shapes; we had almost said in their *plumage*.

Oswegan’s, again, have a red ochery ground, and simple blue or yellow stripes, with a singularly wild and transatlantic effect.

The *Satin Crapes* are still finer in the double combination of these simple figured stripes; the length of line and tenuity of breadth alone giving grace and character.

Indianas in the shape of *gentlemen’s plaids*, with a manly substantiality of texture, combine such enduring hues as woad-blue, in a subdued white diamonded pattern, or as the homely shepherd’s plaiding itself. This description of goods is homespun-like, but comfortable looking.

For the ladies, however, the *Tartan plaids*, in endless combinations of Scotia’s immortal chequering, are very different articles, being, one and all, fine in texture to an extreme.

We next came to the principal and staple commodity of Paisley manufacture—*The Wove Shawls* of Paisley; but they merit an article to themselves.

FRANK FAIRLEIGH;

OR, OLD COMPANIONS IN NEW SENSES.

By F. E. S.

CHAP. IX.

THE WINE PARTY.

LET the reader imagine a long table covered with the remains of an excellent dessert, interspersed with a multitude of bottles of all shapes and sizes, containing every variety of wine that money could procure, or palate desire; whilst in the centre stood a glorious old China bowl of punch, which the guests were discussing in tumblers,—wine-glasses having been unanimously voted much too slow. Around this table sat there he seated from fifteen to twenty men, whose ages might vary from nineteen to three or four and twenty; some smoking cigars, some talking vociferously, some laughing, some, though they were decidedly the minority, listening: but all showing signs of being more or less elated by the wine they had taken. Let the reader imagine all this, and he will have a pretty correct idea of Lawless’s wine-party as it appeared about ten o’clock on the evening subsequent to the conversation I have just detailed.

“Didn’t I see you riding a black horse with one white stocking, yesterday, Oaklands?” inquired a young man with a round jovial countenance, which might have been reckoned handsome, but for the extreme redness of the complexion, and the loss of a front tooth, occasioned by a fall received in the hunting field, whose name was Richard, or, as he was more commonly termed Dick, Curtis.

“Yes,” replied Oaklands, “I dare say you did; I was trying him.”

“Ah! I fancied he was not one of your own.”

“No: he belongs to Tom Barnett, who wants me to buy him; but I don’t think he’s strong enough to carry my weight; there’s not substance enough about him; I ride nearly eleven stone.”

“Oh! he’ll never do for you,” exclaimed Lawless. “I know the horse well; they call him Blacksmith, because the man who bred him was named Smith; he lives down in Lincolnshire, and breeds lots of horses; but they are none of them, at least none that I have seen, what I call the right sort; don’t you buy him,—he’s got too much daylight under him to suit you.”

“Too long in the pasterns to carry weight,” urged Curtis.

“Rather inclined to be cow-hocked,” chimed in Lawless.

“Not ribbed home,” remarked Curtis.

“Too narrow across the loins,” observed Lawless.

“And so he’ll never carry much flesh,” continued Curtis.

“Therefore it’s useless to think of his jumping; he’ll never make a hunter,” said Lawless.

“Only hear them,” interrupted a tall fashionable-looking young man, with a high forehead, and a profusion of light curling hair, “Now those two fellows are once off, it’s all up with anything like rational conversation for the rest of the evening.”

“That’s right, Archer, put the curb on ’em; we might as well be in Tattersall’s yard at once,” observed another of the company, addressing the last speaker.

“I fear it’s beyond my power,” replied Archer; “they’ve got such an incurable trick of talking equine scandal, and taking away the characters of their neighbour’s horses, that no one can stop them except Stephen Wilford.”

The mention of this name seemed to have the effect of rendering every one grave, and a pause ensued,

during which Oaklands and I exchanged glances. At length the silence was broken by Curtis, who said,—

"By the way, what's gone of Wilford? I expected to meet him here to-night."

"He was engaged to dine with Wentworth," said Lawless; "but he promised to look in upon us in the course of the evening; I thought he would have been here before this."

As he spoke, a tap was heard at the room-door.

"Well, that's odd," continued Lawless; "that's Wilford, for a ducat; talk of the devil,—eh, don't you know? Come in."

"You had better not repeat that in his hearing," observed Archer, "though I believe he'd take it as a compliment on the whole; it's my opinion he rather affects the antic."

"Hush," said Curtis, pressing his arm, "here he is."

As he spoke, the door opened, and the subject of their remarks entered. He was rather above the middle height, of a slight, but unusually elegant figure, with remarkably small hands and feet, the former of which were white and smooth as those of a woman. His features were delicately formed and regular, and the shape of his face a perfect oval; strongly marked eyebrows overshadowed a pair of piercing black eyes; his lips were thin and compressed, and his mouth finely cut; his hair, which was long and most scrupulously arranged, was jet black, as were his whiskers, affording a marked contrast to the death-like pallor of his countenance. The only fault that could be found in the drawing of his face was, that the eyes were placed too near together; but this imparted a character of intensity to his glance, which added to, rather than detracted from, the general effect of his appearance. His features, when in repose, were usually marked by an expression of contemptuous indifference; he seldom laughed, but his smile conveyed an indication of such bitter sarcasm, that I have seen men, whom he chose to make a butt for his ridicule, writhe under it as under the infliction of bodily torture. He was dressed, as was his wont, entirely in black; but his clothes, which were fashionably cut, fitted him without a wrinkle. He bowed slightly to the assembled company, and then seated himself in a chair, which had been reserved for him at the upper end of the table, nearly opposite Oaklands and myself, saying as he did so,—*"I am afraid I'm rather late, Lawless, but Wentworth and I had a little business to transact, and I could not get away sooner."*

"What devil's deed have they been at now, I wonder," whispered Oaklands to me.

"Murder, probably," replied Archer, (who was seated next me, and had overheard the remark,) "Wilford appears so thoroughly satisfied with himself; that was just the way in which he looked the morning he winged Sherringham, for I saw him myself."

"Send me down the claret, will you, Curtis?" asked Wilford. "Punch is a beverage I don't patronize; it makes a man's hand shaky."

"If that is the case," returned Archer, "you ought to drink it for the good of society, my dear Wilford; let me help you to a glass."

"Nonsense, Archer, be quiet, man; here, taste this cool bottle, Wilford: claret's good for nothing if it's at all flat," exclaimed Lawless, drawing the cork of a fresh bottle as he spoke.

"I differ from you in that opinion, Archer," returned Wilford, fixing his keen black eyes upon the person he addressed with a piercing glance, "society is like the wine in this glass," and he filled a bumper to the brim with claret as he spoke; "it requires a steady hand to keep it within its proper bounds, and to compel it to preserve an unruffled surface," and so saying he raised the glass to his lips without spilling a drop, still keeping his eyes fixed upon Archer's face with the same withering glance.

"Well, I have often heard of looking daggers at a

person," continued Archer, who had been drinking somewhat deeply during the evening, and now appeared possessed by a spirit of mischief leading him to tease and annoy Wilford in every way he could think of, "but Wilford does worse, he positively looks pistols,—cocked and loaded pistols—at one. Fairleigh, I shall screen myself behind your broad shoulders; I never could stand fire." So saying, he seized me by the elbows, and, urging me forward, crouched down behind me, affecting the extremity of terror.

The scowl on Wilford's brow deepened as he spoke, but, after a moment's hesitation, apparently considering the affair too absurd to take notice of, he turned away with a contemptuous smile, saying, "You make your punch too strong, Lawless."

Archer instantly recovered his erect attitude, and with a flushed face seemed about to make some angry reply, when Lawless, who appeared nervously anxious that the evening should pass over harmoniously, interposed. "Archer, you're absolutely incorrigible; keep him in order Fairleigh, eh? give him some more punch, and fill your own glass,—it has been empty I don't know how long. I'll find a toast that will make you drink,—bumpers round, gentlemen, 'to the health of the prettiest girl in Hertfordshire.' Are you all charged? I beg to propose——"

"Excuse my interrupting you, Lawless," exclaimed I,—for I felt certain who it was he was thinking of, and the idea of Miss Saville's name being mentioned and discussed with the tone of licence common on such occasions, appeared to me such complete profanation, that I determined, be the consequences what they might, to prevent it—"Excuse my interrupting you, but I should feel greatly obliged by your substituting some other toast for the one you were about to propose."

"Eh, what! not drink the young woman's health? why I thought you admired her more than I do; not drink her health? how's that, eh?"

"I shall be most happy to explain to you the reasons for my request at some other time," replied I, "at present I can only add that I shall consider it as a personal favour if you will accede to it."

"It does not appear to me to require an *Edipus* to decipher Mr. Fairleigh's reasons for this request," observed Stephen Wilford, "he evidently does not consider the present company deserving of the high honour of drinking the health of a young lady, whom he distinguishes by his admiration."

"Not over flattering, I must say," muttered Lawless, looking annoyed.

"I suppose he's afraid of our hearing her name, lest some of us should go and cut him out," suggested Curtis in an under tone, which was, however, perfectly audible.

"In the meanwhile, Lawless, I hope you're not going to indulge your friend's caprice, at the expense of the rest of the company," resumed Wilford; "having raised our expectations, you are bound to gratify them."

Lawless, who evidently hesitated between his desire to assert his independence, and his wish to oblige me, was beginning with his usual, "eh? why, don't you see,"—when I interrupted him by saying, "Allow me to set this matter at rest in a very few words. Lawless, I hope, knows me well enough to feel sure that I could not intend any disrespect either to himself or his guests—I believe it is not such an unheard-of thing for a gentleman to object to the name of any lady whom he respects, being commented upon with the freedom incidental to a convivial meeting such as this is—however that may be, I have asked Lawless as a favour not to drink a certain toast in my presence; should he be unwilling to comply with my request, as I would not wish to be the slightest restraint upon him at his own table, I shall request his permission to withdraw: on this point I await his decision. I have only one more observation to make," continued I, looking at Wilford, who was evidently preparing to speak, "which is, that

if, after what I have just said, any gentleman should continue to urge Lawless to give the toast to which I object, I must perforce consider that he wishes to insult me."

As I concluded there was a murmur of applause, and Archer and one or two others turned to Lawless, declaring it was quite impossible to press the matter further, after what I had said; when Wilford, in a cold, sarcastic tone of voice, observed, "I am sorry Mr. Fairleigh's last argument should have failed in convincing me, as easily as it seems to have done some others of the party; such, however, unfortunately being the case, I must repeat, even at the risk of incurring a thing so terrible as that gentleman's displeasure, my decided opinion that Lawless, having informed us he was going to drink a particular toast, should not allow himself to be bullied out of it, in compliance with any man's humour."

This speech, as might be expected, produced great excitement: I sprang to my feet, (an example followed by several of the party,) and was about to make an angry reply, when Oaklands, who up to this moment had taken no part in the discussion, but sat sipping his wine with his usual air of listless contentment, apparently indifferent to, if not wholly unconscious of, all that was going on, now rose from his seat, and having obtained silence said, "Really, gentlemen, all this confusion appears to me very unnecessary, when a word from our host will end it. Fairleigh has asked you not to propose a certain toast; it remains for you to say, Lawless, whether you intend to do so or not."

Thus urged, Lawless replied "Eh? no, certainly not; Frank Fairleigh's a trump, and I would not do anything to annoy him for more than I can tell: besides, when I come to think of it, I believe he was right, and I was wrong--but you see women are a kind of cattle I don't clearly understand--if it was a horse now--"

A burst of laughter at this characteristic remark drowned the conclusion of the speech, but the announcement that the toast was given up appeared to produce general satisfaction: for, since I had spoken, the popular opinion had been decidedly in my favour.

"The cause of this little interruption to the harmony of the evening being removed," resumed Oaklands, "suppose we see whether its effects may not as easily be got rid of. Every man, I take it, has a right to express his own opinion, and I think Fairleigh must allow that he was a little hasty in presupposing, that by so doing, an insult was intended--this being the case, he will I am sure, agree with me that he ought not to take any notice of Mr. Wilford's remark."

"Yes, to be sure, that's it--all right, eh?" exclaimed Lawless, "come Fairleigh, as a favour to me, let the matter end here."

Thus urged, I could only reply, that "I was quite willing to defer to their judgment, and do whatever they considered right"--and as Wilford, though I could see that he was annoyed beyond measure at having failed in persuading Lawless to drink the toast, remained silent, merely curling his lip contemptuously when I spoke; here the affair ended.

As soon as the conversation became general, Oaklands turned to me with a mischievous smile, and asked in an under tone, "Pray, Master Frank, what's gone of all the wisdom and prudence recommended to me this morning? I am afraid you quite exhausted your stock, and have not reserved any for your own use; who's the fire-eater now, I wonder?"

"Laugh away, Harry: I may have acted foolishly, as is usually the case, where one acts entirely from impulse; but I could not have sat tamely by, and heard Clara Saville's name polluted by the remarks of such men as Curtis and Wilford--I should have got into a row with them sooner or later, and it was better to check the thing at once."

"My dear boy," returned Oaklands, "do not imagine for a moment that I am inclined to blame you; the only

thing that I could not help feeling rather amused at, was your throwing down the gauntlet to the gentleman opposite, when I recollected a certain lecture on prudence, with which I was victimized this morning."

"As you are strong, be merciful," replied I, "and, whenever I do a foolish thing, may I always have such a friend at hand to save me from the consequences."

"That's a toast I will drink most willingly," said Oaklands smiling, "the more so, as it reverses the position in which we generally stand with regard to each other, the alteration being decidedly in my favour--but," he continued, interrupting himself, "what on earth are they laughing at, and making such a row about?"

"Oh, it's merely Curtis romancing with the most unmitigated effrontery, about something that neither he, nor any one else, ever did, out hunting," replied Archer, "a tremendous leap, I fancy it was."

"Do not be too sure that it is impossible," replied I, "a horse once cleared the mouth of a chalk-pit with me on its back, when I was a boy; Lawless remembers it."

"Eh! what? Mad Bess!" returned Lawless, "I should think I did, too; I rode there afterwards and examined the place--a regular break-neck looking hole as ever I saw in my life--tell 'em about it, Frank."

Thus called upon, no choice was left me but to commence the recital, which, although there are few things to which I have a greater objection than being the hero of my own story, I accordingly did. Several remarks were made as I concluded, but, owing either to my well known dislike of exaggeration, or to the air of truthfulness with which I had told the tale, nobody seemed inclined to doubt that the adventure had occurred in the manner I related, although it was of a more incredible nature than the feat Curtis had recounted. This fact had just excited my attention, when Wilford, turning to the man on his right hand, observed, "It's a great pity that some one hasn't taken notes of this evening's conversation, they would have afforded materials for a new volume of the adventures of Baron Munchausen."

My only answer to this remark, which was evidently intended for my hearing, was a slight smile, for I had determined I would not again be betrayed into any altercation with him, and, being now on my guard, I felt pretty sure of being able to maintain my resolution. To my annoyance, Oaklands replied, "If your remark is intended to throw any discredit upon the truth of the anecdote my friend has related, I must be excused for observing that Lawless and I, though not actually eye-witnesses of the leap, are yet perfectly aware that it took place."

"Was that remark addressed to me, Mr. Oaklands?" enquired Wilford, regarding Oaklands with an insolent stare.

"To you, sir, or to any other man who ventures to throw a doubt on what Fairleigh has just stated," replied Oaklands, his brow flushing with anger.

"Really," observed Wilford with a contemptuous sneer, "Mr. Fairleigh is most fortunate in possessing such a steady and useful friend; first, when he dictates to Lawless what toasts he is to propose at his own table, and threatens the company generally with the weight of his displeasure, should they venture to question the propriety of his so doing, Mr. Oaklands kindly saves him from the consequences of this warlike declaration, by advancing the somewhat novel doctrine, that his friend, having spoken unadvisedly, ought not to set up to the tenor of his words--again, Mr. Fairleigh relates a marvellous tale of his earlier days, and Mr. Oaklands is prepared to visit the most trifling indication of disbelief with the fire and fagots of his indignation--Gentlemen, I hope you are all good and true Fairleighites, or you will assuredly be burned at the stake, to satisfy the bigotry of Pope Oaklands the First."

During this speech, I could perceive by the veins on his forehead, swollen almost to bursting, his firmly-set

teeth, and his hands clenched till the blood was forced back from the nails, that Oaklands was striving to master his passion; apparently he succeeded in great measure, for, as Wilford concluded, he spoke calmly and deliberately, "The only reply, sir," he began, "that I shall deign to make to your elaborate insult is, that I consider it as such, and shall expect you to render me the satisfaction due to a gentleman."

"No, Harry," exclaimed I, "I cannot permit this: the quarrel, if it be a quarrel, is mine; on this point I cannot allow even you to interfere—Mr. Wilford shall hear from me."

"No, no!" exclaimed Lawless, "I'm sure you must see, Wilford, that this is not at all the sort of thing, eh? recollect Oaklands and Fairleigh are two of my oldest friends, and something is due to me at all events, eh? —Archer—Curtis—this cannot be allowed to go on."

By this time the party had with one accord risen from their seats, and divided into groups, some collecting round Wilford and Lawless, others about Oaklands and myself, and the confusion of tongues was perfectly deafening. At length I heard Wilford's voice exclaim "I consider it unfair in the extreme to lay all this quarrelling and disturbance to me, and, as it is not at all to my taste, I beg to wish you a very good evening, Lawless."

"You will do no such thing," cried Oaklands, and, bursting through the cluster of men who surrounded him and endeavoured to detain him, he sprang to the door, double-locked it, and, placing his back against it, added "no one leaves the room till this affair is settled one way or other." The action, the tone of voice, and the manner which accompanied them, reminded me so forcibly of a deed of a somewhat similar nature at Dr. Mildman's, when Oaklands first heard of the loss of his letter containing the check, and began to suspect foul play—that for a moment the lapse of years was forgotten, and it seemed as though we were boys together again.

Whenever Oaklands was excited by strong emotion of any kind, there was a proud consciousness of power in his every look and motion, which possessed for me an irresistible attraction; and now, as he stood, his noble figure drawn up to its fullest height, his arms folded across his ample chest, in an attitude of defiance a sculptor would have rejoiced to imitate; his head thrown slightly back, and his handsome features marked by an expression of haughty indignation; when I reflected that it was a generous regard for my honour which excited that indignation,—I felt that my affection for him was indeed "passing the love of women;" and that he was a friend for whom a man might resolve to lay down his life willingly.

While these thoughts passed through my brain, Lawless and several of the more influential members of the party had been endeavouring to persuade Wilford to own that he was in the wrong, and ought to apologise, but in vain; the utmost concession they could get him to make was, that "he was not aware that he had offered any particular insult to Mr. Oaklands, but that if that gentleman chose to put such a construction upon his words, he could not help it, and should be ready to answer for them, when and where he pleased."

They were then, as a last resource, about to appeal to Oaklands, when I interfered by saying, "that the insult, if insult it was, had originated from the part I had taken in the proceedings of the evening, and was directed far more against me than Oaklands; that under these circumstances, it was impossible for me to allow him to involve himself further in the affair. If my honour were impugned, I was the proper person to defend it; there could be but one opinion on that subject."

To this they all agreed, and at length Oaklands himself was forced reluctantly to confess he supposed I was right.

"In this case, gentlemen," I continued, "my course is clear; I leave my honour in your hands, certain that,

in so doing, I am taking the wisest course; Honourable men, and men of spirit like yourselves, will, I feel certain, never recommend anything incompatible with the strictest regard for my reputation as a gentleman; neither will you needlessly hurry me into an act, the consequences of which might possibly embitter the whole of my after life. In order that personal feeling may not interfere any more with the matter, my friend and I will withdraw; Lawless will kindly convey to me your decision, on which, be it what it may, I pledge myself to act; I wish you a very good night."

Then telling Lawless I should sit up for him, and shaking hands with two or three members of the party, with whom I was most intimate, I drew Oaklands's arm within my own, and unlocking the door, left the room, Wilford's fierce black eyes glancing at us with a look of disappointed fury such as I have witnessed in a caged tiger, being the last object I beheld.

THE ORPHANS OF ST. GRATIEN;

OR,

FANCHETTE BRULARD.

CHAPTER I.

It was Christmas Eve, and already night had fallen. The snow fell in large flakes, and the wind howled in the loose rafters of a cabin of St. Gratien, not far from the valley of Montmorency; but the bad weather outside was nothing in comparison to the desolation which reigned in the interior of this wretched cabin.

Upon a truckle bed, with but scanty covering, lay a sick woman. She was still young; her thin pallid features seemed altered rather by grief and misery than by age; she was evidently dying. At the foot of the bed two children were asleep in a cradle; and by the bed-side a young girl, of about twelve years old, was kneeling and weeping.

A silence almost to be felt pervaded this miserable chamber. In the interval of every gust of wind which shook the door and window, making them creak on their rusty hinges, no other noise was heard save that which the sick woman made in tossing on her hard couch, and the gentle equal breathing of the two children. As to the young girl, she might have been taken for a statue, had it not been for the looks that now in apprehension she cast on her mother, as if half doubting that she would again awake, and now raised imploringly to heaven.

A tallow candle, burning in a brass candlestick, which, though much worn out, was as brilliant as gold, shed light over this gloomy scene.

But soon the sick woman, who for three days had been unable to speak, suddenly sat up in her bed, and distinctly pronounced the name of "Fanchette."

"Here I am, dear mother," said the young girl.

"You are not yet gone to bed, my child," said she, in a weak faint voice.

"I do not feel sleepy, mamma," replied Fanchette, endeavouring to appear calm and tranquil.

"What is the hour now?"

"The clock of St. Gratien has just struck eight."

"Sit down beside me; I want to speak to you, Fanchette."

And the young girl silently seated herself; for there was something grave and solemn in the accents of the dying mother, like the sound of a beloved voice which is heard for the last time. The poor woman continued, "To-morrow, my daughter, is Christmas day; you will go to divine service, will you not?... you will take your brother and sister there.... no matter what happens.... if even I should be...." she hesitated,
